FALLEN FORTUNES.

BY JAMES PAYN,

AUTHOR OF 'LOST SIR MASSINGBERD,' 'WALTER'S WORD,' &c.

CHAPTER I.—AFTER THE CHARADES.

It is night, and the moon is rising over crag and coppice in its fullness, making all things, as is commonly said, 'as light as day.' Its silent, silvery splendours do not, however, vie with the golden glories of noonday, but have a radiance of their own, infinitely more enchanting as it gleams on wood and wave. Never does Nathay look so charming as when its smooth, swift stream mirrors the moonbeams, or steals coily from them in eddy and pool beneath its bush-fringed banks. Never do the tall crags of Bleabarrow stand so grandly out as beneath this harvest moon. How distinctly does every giant boulder assert itself, every heather-clad knoll, and every mountain ash that leans aslant out of its rocky cleft, like a flag at a ship's stern in calm! To one who observes her closely, Nature has at this time a listening air; the giant boulders, in their statuesque magnificence, seem to be awaiting something, the utterance, it may be, of some magic charm that shall confer a wondrous transformation; the ash is leaning and listening; even the tufts of heather stand stiffly up, as though in expectation. If he be alone in such a scene, Man himself mechanically listens also; and to some a voice is vouchsafed—uncertain, vague, yet pregnant, so it seems, with eternal mysteries; and by others there is no sound heard, save the whisper of the wind among the trees, or the murmur of the stream as it hurries to the fall.

'Listen, Kitty, listen! Is it not pleasant to hear the Nathay tumbling over the weir in a night like this?'

The speaker is a plump, fair girl in a housemaid's dress, who is standing at an open window of a mansion commanding a view of the weir, and she addresses one of her own age and sex who is leaning over the window-sill beside her.

To judge from the attire of the latter, which is a neat and cheap one, such as is bought for solid merit, as respects its washing qualities, rather than for pattern and texture, and by the little apology for a cap, made out of imitation lace, that crowns her rich brown hair, you would conclude her to be of the same station as her companion; but Kate has an air of refinement that the other lacks. They are both, however, what even bachelors, who have arrived at the critical age, would term pretty girls; and if Mary (for that is the speaker's name) is inclined to be stout, that is no defect, so far as my poor judgment goes, in a pretty housemaid, but generally bespeaks content and good-nature. She is evidently one of those who do not 'work their fingers to the bone' in the performance of household duties, for her hands are smooth and delicate, while it is equally plain that her occupation lies within doors, for her complexion is as soft as cream, and almost as white. Her neck, too, though marred by the presence on either side of it of a large blob of mosaic gold in the shape of an ear-ring, is free from roughness or sunburn; and its delicacy contrasts prettily enough with the gay cotton handkerchief pinned above her bosom, in that old-world modest fashion which is rarely seen in these days, even when modesty is affected, as upon the stage. Upon the whole, we would say that Mary is a superior young person in her rank of life, and that her mistress is an easy one, and leaves her plenty of leisure to adorn and preserve her charms; and woe be to the susceptible gamekeeper (one would go on to prophesy) who, in his watchful rounds to-night, should behold that pleasant vision as she gazes out on Nathay's stream and crags. Kate, like Mary, is a blonde; but the resemblance between the girls goes no

further. She is a year or two younger than her companion—indeed, unusually young for one in domestic service—and has an air of delicacy so pronounced, that it only just falls short of the appearance of ill-health. Her cheek-bones might be termed too high, and her frame too angular, if it were not that Nature has not yet done with her. Her beauty is at present in the budding stage, though it gives promise of great perfection; and her eyes are too soft and spiritual, one would say, for the task of looking for cobwebs or cleaning grates. If she is to be up betimes to-morrow, and go about her work as usual, it strikes one that they ought long ago to have been closed in sleep, instead of looking on rock and river with such a thoughtful and impassioned gaze.

'You hear the weir, don't you, Kitty,' continued Mary; 'though it seems you don't hear me?'

'A thousand pardons, Polly. O yes, I hear it well enough, and I heard your question too; but, somehow, on a night like this, one likes to think, and not to talk. It was very selfish of me not to answer you; but I was wondering how long your river had run on like this, how many generations of men and women had listened to it, and how many more will do so, when you and I shall have no ears for its ceaseless song.'

'No ears, dear Kitty; what a funny notion! Oh, I see; you mean when we shall both be dead.'

'Yes; dead and gone, Mary. The moon will shine as calmly as it does now, yonder, glistening on those crags we know so well; and the sky will be just as blue and beautiful; the trees will be even grander and larger; but we shall never see them more.'

'Well, of course not; we shall be enjoying something better in heaven—at least I hope so.'

'Do you really hope so, Polly?' asked the other earnestly; 'or is it only that you hope you are not going elsewhere? I cannot help thinking that we often pretend we want to go to heaven, when we have in reality no expectation of the sort.'

'O Kitty, how can you be so wicked!'

'But is it not wicked to pretend such things? It seems to me to be attempting to deceive not only ourselves, but Him who made us. Now, on a night like this, and looking on so fair a scene, I almost feel as if I ~~was~~ in heaven; as though, at all events, I was not of the earth—earthly—but was projected somehow—I don't know how—into some diviner sphere. There seem influences about us such as are not perceived at other times, if they then exist; a sort of communion appears to be established between our souls and Nature herself'—

'You are "projecting" me, dear Kitty,' interrupted the other, laughing. 'very much beyond my depth: for my part, I am quite content to leave speculation alone, or, where there seems a hitch, to trust to the clergyman.'

'That is, because you are conscious of being so comfortably located, that the very idea of change, even in one's ideas, annoys you. From your cradle to your grave, you will, in all human probability, be out of the reach of adversity; and therefore this world seems sufficient for all your wants, if not the best of all possible worlds.'

'For that matter, you will be just as well off as I, Kitty.'

'So far as material wants are concerned, I suppose I shall; but I cannot shut my eyes to the

position of those who are less favoured by I often wonder if one were poor, and looked upon (as, I fear, poor people are, whatever may say), and conscious of injustice and contumely, whether one's views of the future would be altered as much as one's views of the present seems to me that it is much easier for the poor to be what is called orthodox—to pronounce whatever is to be right, and to take matters as they find them mapped out for them, both here and hereafter—than for the poor.'

'Yet I am sure some of our poor people here mean of those that belong to the estate'—

'A very different thing from the estate belonging to them, Polly,' interrupted her companion drily.

'Of course it is. Providence has placed them in a subordinate position; but yet they are often better people—I have heard the rector say so—and more religious-minded, than their masters. They are ill-lodged and ill-fed, rheumatic, and I know not what else; but yet they never complain, nor seem to think it hard though they see others so much better off.'

'Still, I confess I should feel it bitterly, Polly if I were in their place,' answered the other earnestly. 'I am afraid I should be a radical and an infidel, and all that is bad.'

'Well, then, I am very glad that you are unlikely to be exposed to the temptation, cousin, was the laughing reply. 'If your papa gets into parliament, he is quite clever enough to become a cabinet minister, and then you will be a great lady; when you will soon get rid of these socialistic sort of ideas, and begin to patronise us all.'

'Patronise!' exclaimed Kate; 'that is another thing that seems to me to embitter the position of the poor almost beyond endurance. There are people in our class even who seem to imagine that they have bought their fellow-creatures out and out—body and soul—with a few yards of flannel or, very literally, a few "messes of pottage." Even if they had settled a comfortable annuity upon their unhappy victims, they could not have the right to treat them as they do; but to have bought them so cheap, and then to give themselves airs of proprietorship, is to my mind a very offensive spectacle.'

'My dear Kitty,' cried the other, laughing, 'you are not of a more "umble" spirit, and do not feel more grateful for your perquisites than you. Your language seems to promise, you will never get into an "upper" situation. Even as it is, you know, I was noticed by Mr Holt in the church to-night that you looked above your place.'

'I daresay I should be very unfitted for it,' was the grave rejoinder, 'as well as for anything else that was really useful. I often wonder'—

'What is the good of it? You are always wondering, Kitty,' broke in the other girl.

'I can't help it; and I have heard it said that wonder is a stepping-stone to understanding. I say I often wonder, if papa and mamma were to be ruined, what use I could possibly be to them. How could I get my own bread, even, except by the very occupation we have been playing at to-night—that of domestic service. As to going out as a governess, for example, what qualification do I possess for such a post?'

'Oh, that is no obstacle, my dear Kitty, for

half-a-dozen governesses, and not one of whom what she proposed to teach.'

'I told you I thought it wicked to "pre- and so I do; so that the profession of which would be out of the question, so far as I concerned. What on earth, then, should I do, were penniless?'

'I will tell you. You would send an unpaid girl to Miss Mary Campden, Riverside, Bleaslow, Derbyshire, telling her how matters stood; as soon as steam and wheels could take her, she would be with you; and this would be her answer: "Come to Riverside, Kitty, and for the rest of your life make it your home. We have always been sisters at heart, though only cousins by birth; let me now prove how much I love you."'

'As Polly said these words, her pretty face was lit up with the brightest of smiles, and her voice had quite a touch of generous welcome.

'My dearest Polly, how good you are!' said Kitty.

'And you *would* come to me, would you not, and make this your home for life?'

'Well, you see, there would be papa and mamma, and poor Jenny and Tony. I could never leave them, and live in luxury, while they were poor.'

But we should never let them be poor, of course; I mean my papa and mamma would not permit it. Even if you were not—all of you—the dearest friends we have in the world, blood is thicker than water, and has indisputable claims.'

'Then how is it that neither your people nor mine ever take any notice of Uncle Philip?'

'O Kitty, you must not speak of him; indeed, you must not. He is not your uncle at all, you know, legally. He is a person whose name should never be mentioned; at least by you and me, and young girls like you and me. We ought not even to be aware of his existence.'

'But since we are aware?'

'Well, then, we should ignore it. It is your father, even more than mine; for if the law had sided otherwise than it did, your papa would have been disinherited, and this man Astor would have succeeded to your grandfather's property.'

But this man Astor, as you call him, is my father, nevertheless,' persisted Kitty; 'and it was his fault that his mother was not my grandmother.'

'What a funny child you are! Of course, it is not; but a great many people in the world are victims to misfortune. It is the will of Providence. Why, it's in the Bible itself, Kitty, that the sins of the fathers shall be visited on their children.'

'I know it is; but it seems very hard, for all that.'

'But that is very wicked, Kitty.'

'What! to pity Uncle Philip? Then I hope I shall be always wicked.'

Here there was a little pause. Mary knew by experience that it was idle to argue with her cousin upon general principles, and at once resorted to particulars.

'I have heard that Mr Astor is a bad man; dissipated and untrustworthy; a sort of person who is certain to go to the dogs.'

'Who told you that?'

'One who knows him better than anybody,

because he has more to do with him; one, too, who is a great friend of your father's, and a warm admirer of yourself, so that you should receive his opinion with respect on all accounts.'

'I would not believe everything Mr Holt says, if you mean him,' observed Kitty quietly; 'and even if he be right in this case, Uncle Philip is still to be pitied. I saw him once by accident when I was quite a child; so like in face, and even in voice and manner, to his brother, dear papa, and yet so different in their positions in life.'

'They are different every way, Kitty, if you only knew them better,' answered Mary gravely. 'Mr Astor is a *mauvais sujet*. Mr Holt tells me he is about to leave England for good and all, to try his fortune in the New World; and from what he said, I am confident that that will be a happy thing for all parties.'

'That is what people always say when they have contrived to shake some responsibility off their shoulders,' said Kitty.

'Nay, Mr Philip Astor is certainly no responsibility of ours, at all events,' observed Mary quickly.

'I was not thinking of Uncle Philip just then, Polly.'

'Ah, you were thinking of Geoffrey. Well, of course I regret that mamma should have expressed herself in those terms to-night about him; but it cannot be expected that the lad should live at Riverside all his life; and since he has a fancy for the sea, why should he not indulge it?'

'But he has no such fancy; it is only that he feels himself a burden—or rather, he is made to feel it'—

'I don't see that, Kitty; indeed, I don't,' interrupted the other sharply.

'Then you must be stone-blind.'

'O no; it is merely that I look at him with ordinary eyes, and don't make a fool of the boy, by pretending to be in love with him.'

'No; you conceal your affection for him very well, it must be confessed.'

'I wish I could return the compliment, Kate. You make yourself quite conspicuous by your attentions to that young lad. It is a very mistaken kindness in you—to say the least of it. If you mean nothing by it, it is an act of cruelty to him; and if you do mean anything, Geoffrey Derwent has scarcely a shilling he can call his own, and is not the sort of character to make a fortune, so that he will never be in a position to marry.'

'I think this discussion is uncalled for, cousin,' answered Kitty, drawing up her slight figure to its full height.

'You provoked it yourself, Kate, by reflecting upon mamma's conduct to Geoffrey; and while we are upon the subject, I would recommend that when your father comes to-morrow, you should be a little more discreet in your behaviour, for he has quicker eyes than your mamma, who has not such a knowledge of the world.'—

'My mamma knows all that she needs to know, though she knows nothing bad,' interrupted Kate, in indignant tones; 'she is not only the best, but the wisest of God's creatures in all that He deems to be wisdom; and I would rather have her good opinion than that of all the world beside.'

'My dear Kitty, I never uttered one word against her (nor have ever dreamed of doing so),

so you need not be so fiery in your championship; whereas, you did reflect upon the conduct of my mother as respected Geoffrey; she is not so fond of him as you are, but she has done her duty by him—and more than her duty—for the last ten years.'

'Till at last she is getting a little tired of it,' observed Kate coldly.

'You have no right to say that, cousin; Geoffrey has been brought up like one of the family—just as though he had been my own brother; and yet he has no natural claim upon us'—

'For shame, Mary!' interrupted the other indignantly. 'How can you talk like that? Do you suppose I don't know how it all came about? How old Mr Derwent was your father's dearest friend, and put him on the road to fortune, though he lost all himself. No natural claim? Is gratitude, then, contrary to nature?'

'What! do you call my father ungrateful, you, who know that Geoffrey has been educated entirely at his expense?'

'Heaven forbid! He is the most kind and generous of men; but I honestly tell you that I think he has done no more than his duty in paying for Geoffrey's schooling. Why, I have heard him say myself—and I honour him for it—that he owes all he has in the world to old Mr Derwent; and what is Geoffrey's schooling out of your papa's ten thousand a year? Why, not so much as he pays to his second gardener! I think it unworthy of you, Mary, to adduce such a thing as evidence that the poor boy has nothing to complain of in the teeth of the scene we witnessed to-day; I do, indeed.'

'I think that mamma was a little hard upon Geoffrey, Kate,' answered Mary slowly; 'but not so hard as to evoke such indignation on your part. Of course if—at seventeen—the young gentleman is your accepted lover, you have every right to be in a passion; but otherwise, you had better have been silent—at least to my mother's daughter.'

'I am not in a passion even now, Mary; though what you have just said was designed to put me into one. If I know myself, I should have been just as angry to have seen any other person in a dependent position so contemptuously treated as Geoffrey was; but if I have said anything disrespectful of your mamma to you—though I am not aware of it—I am very sorry for it. It was altogether wrong of me, and would have been so, had I so spoken of her to anybody—far more to you. Mrs Campden has been always most kind to me, I'm sure; and a kinder hostess to us all it is impossible to picture.'

'Of course she is, because she loves you all; not that she does not love Jeff too; only, she has such a notion of discipline, and of boys making their own way in the world. I think the only exception is your Tony, whom she certainly does spoil; but nobody can help spoiling Tony. How you will miss him, when he goes to Eton in October!'

'Yes, indeed; and how dear mamma will miss him, and above all, poor Jenny! Something to love and cling to, and pet, seems absolutely necessary to her existence. She is herself so dependent on others, that to have some one about her dependent upon her, is an especial delight. Papa says she has taught Tony far better than his masters have done, and that he has got into the

upper school at his entrance examination—he is but nine, you know—has been more owing to her than to them.'

'What a clever family you all are, Kate,' observed Mary admiringly; 'I am quite surprised that everybody is not afraid of you, instead of you being such favourites. I suppose it comes from your having such a clever papa. I sometimes think, that if I could wish my own papa to change in anything—which I don't—I should like him to talk, and laugh, and make everybody admire him, as yours does. Is he always in as high spirits at home as he is everywhere else? I need not ask if he is as good-humoured. I cannot imagine Mr Dalton put out by anything.'

'Well, I don't say papa is never put out,' said Kate, laughing for the first time, as though the topic of talk had begotten merriment; 'but he is so soon all right again, that we rarely notice that there has been any interval of gloom. We have not seen so much of him at home of late, as usual, and we miss him sadly. I am sure, so far as mamma and we are concerned, we would much rather that he was not made a member of parliament, for that will take him more away from us than ever.'

'Oh, but then think of the position, Kate, and the great things which, in his case, it may lead to.'

'I am afraid I am not ambitious, Polly,' sighed Kate; 'and from what I have seen of ambition in papa's case—that is, since he began to sit on "Boards"—which, however profitable, must be very uncomfortable—and to take the chair at this meeting and that, and to busy himself in public affairs, I think it would have been better for him to have remained as he was.'

'But the law was not to his taste, Kate; and though it is true he had a competency of his own, it seemed like hiding his candle under a bushel to remain a briefless barrister all his days. If I were you, I should be so proud of him.'

'You cannot be more proud of him than I am, Polly, or so proud as dear mamma is; but for the reasons I have mentioned, I regret, and so does she, I know, though she would never confess it, that he is standing for Banpton. Since he wishes it, we prefer, of course, that he will succeed; but so far as we are selfishly concerned, if he fails to do so, it will be no disappointment.'

'Oh, but he will not fail; he is far too clever, and has laid his plans too wisely for that; and though it will cost him a good deal of money, it is most important to his interests—so Mr Holt assures me—to secure the seat.'

'Mr Holt seems to have told you a good deal; I wish he would mind his own business. It is he who persuades papa to "go into" this and that, as he calls it, and tells him of "good things," which I fancy don't always turn out as good as they look. Mamma dislikes the man, I know, and distrusts him.'

'But then dear Mrs Dalton is not a woman of business.'

'I don't know about business, Mary: mamma is the best manager of a household I ever knew, which is woman's business, I suppose; and as to people, though she does not talk much, and never says an uncharitable word, her instincts are always right; and in this case my own agree with them. I don't admire this Mr Holt at all, and am very sorry your good father asked him down to

Riverside, at least while we were staying with you. I am not proud myself, you know, and care very little what occupation people follow, so long as they themselves are nice; but I am surprised that Mr Campden should have so "cottoned," as Jeff calls it, to a man like that, who is also, I believe, a stock-broker.'

Not a word was spoken for some moments; nothing was heard but the murmur of the weir, and the melancholy tuwhit tuwhoo of the owls, as they called to one another across the unseen mere above, from which it flowed; then once more Mary broke silence with: 'What is a stock-broker, Kitty, dear?'

If she had asked, What is a stock-love? the inquiry would have been pertinent enough to such a scene; but as it was, the question was so ridiculously inappropriate, that Kitty broke into a silvery laugh, that woke the echoes; it also awoke some one else, for a window was thrown up, immediately beneath that which the two friends occupied, and a thin but decisive voice cried: 'Mary, your father says that there must be no more charades, if they lead to all this discussion afterwards between you girls; I must insist upon your going to bed.'

'Indeed, Mrs Campden, I am afraid it was my fault, not Mary's,' answered Kate penitently from above.

'No, no; I know it is not you, Kitty. Mary would sit up all night, and perhaps be no worse for it; but you are much too delicate for such imprudences'—

'I'll have both those young hussies discharged in the morning,' broke in the bass notes of the exasperated Mr Campden; 'their tittle-tattle robs me of my beauty sleep.'

'What a nice dear old thing, your papa is!' laughed Kate, as she and Mary softly closed their window, and prepared to divest themselves of their borrowed plumes. 'If I was a housemaid, and he in the same service, I should certainly set my cap at him.'

SOME RECENT OBSERVATIONS ON ANTS.

A CONTRIBUTION to the character and habits of ants has lately been made by a Swiss naturalist, M. Forel. This inquirer establishes the fact, that ants of different varieties make war on each other, the stronger and red kind, known as *Formica sanguinea*, overcoming the meadow ants, *Formica pratensis*, and usually reducing them to slavery. The reckless fury with which the red ants attack their unfortunate neighbours is described as something dreadful. M. Forel speaks of it as a sort of 'drunkenness of fight.' Some of the ants around try to stop these delirious combatants by seizing them with their feet, and holding them till they sober down.

On one occasion the author placed a number of workers and cocoons of the meadow ant near a residence of red ants; the latter soon carried off the cocoons. Was it to eat the pupæ? By no means. Next year presented the curious spectacle of both kinds of ants living together in fraternal association. A breach having been made in the nest, both kinds carried the cocoons down below, and sought to repair the disaster with equal zeal. Next, a large number of meadow ants were brought near the habitation, from another district; but those

in the nest, far from welcoming them as congeners, fell upon them in concert with the red ants. The new-comers had the advantage in numbers, and besieged the nest. The allies, conscious of their extremity, took to flight, carrying away slaves, larvæ and pupæ, and new-born workers; and established themselves at a respectful distance. An alliance has sometimes been effected between the inimical species, which has continued many years. Very curious is the mixed ant-hill. Each species retains its own way of building, so that the architecture is mixed. On the dome may usually be seen the meadow ants bearing material, or sunning themselves. If you disturb them, or introduce some unknown animals, they quickly disappear into the nest. They are seeking assistance. Presently appears a host of the red ants, and if a fight occurs, the meadow ants do not join in it with the others.

The newly hatched workers take to domestic work, and do not know friends from enemies for some time. It seemed possible, therefore, to form alliances among several different species, if the subjects brought together were quite young. This proved successful. In a glass case were deposited pupæ belonging to six different species, under the care of three young workers having no common parentage. The establishment developed and increased quite tranquilly, the different species all living in concord. In the free state, such associations are impossible; the only unions realised are between the red and meadow ants.

The relations between ants of the same species, but of different colonies, have been matter of doubt. The truth is, it depends on certain circumstances whether they shall be friendly or hostile. When the parties are established tolerably separate from each other, under satisfactory conditions, they fight each other 'to the bitter end.' If two neighbouring ant-hills be cramped for space, there will be battle and repeated engagements; but in general, the forces coming to be exhausted, an alliance will at length be formed. If two ant-hills have but a small population, the parties will improve their circumstances by an immediate alliance.

When an ant-hill is overcharged with inhabitants, emigrations take place more or less numerous. At the border of a kitchen-garden, a colony of ants had been long established. The paths they took were various; that most frequented lay across the road, passed into a field, and along the side of a pond to a clump of trees; it was very long. In spring, a party of ants went to form a colony among the trees. Later, a fresh party set out from the old home, and became domiciled at the end of another path. The place proved unsuitable; they left it, and settled on a grass plot a little way off. During the whole summer, the workers of the new establishments often met the workers who still remained in the mother-hill, and the reception on both sides was evidently cordial. Autumn came, and the meetings were interrupted. The following year, the inhabitants of each nest got into the habit of not moving far from it; and the old relations were thus broken off. After a considerable time had elapsed, the idea occurred to take some individuals of the old nest and place them near one of the young colonies. Received with anything but cordiality, they were glad to make their escape. In a second experiment of the same kind, the

new-comers, though less harshly treated, were yet received with distrust. It has often been observed that ants separated for a certain time again recognise one another; but if the separation has been very long, they lose all recollection of their companions. It must be considered, however, that the population soon becomes greatly altered by new generations.

M. Forel made a patient study of the famous amazon ants, which are unable to construct, or to rear the larvae, or even to eat alone. Their chief work is fighting; they carry off the pupæ of working ants in other hills, but afterwards tend these with much care. Many new details are furnished by M. Forel regarding them. The amazon ant (*Formica rufescens*) is of a pale red, and about six or seven millimetres in length; the female is a little larger. The neuter individual—it can hardly be called a worker—carries five curved and branched mandibles with drawn-out points. Such an instrument cannot be used to cut wood or temper earth; it is simply a weapon. The amazons, thus equipped, fight quite differently from other ants. Unable to seize their adversaries with the legs and cut off the head or limbs, they attack the body, or transpire the head with a mandible point. They shew great agility and impetuosity in their movements, and a courage bordering on rashness. Never seeking safety in flight, the individual will rush on a strong ant-hill and kill several of the offenders, till he is overpowered by force of numbers. It is only in desperate cases, however, that amazons shew such rashness; when on expeditions, they march in close ranks, retire if serious danger threatens them, and make detours to avoid obstacles. The individual that may have got separated by accident on the way, hastens to rejoin the main body, and he will craftily avoid a too numerous enemy. When the journey is long, the amazons make halts, perhaps for the sake of stragglers, perhaps, also, from hesitation as to the direction to be taken. The force of expeditionary columns is very variable; sometimes not more than a few hundred individuals, often from a thousand to two thousand. The departures on these enterprises take place always in the afternoon; about two o'clock, if the temperature is not excessive; but later, if it is a very hot day. The preparations are speedy. Some ants are seen walking about on the dome in an indifferent way; suddenly a few individuals go inside; the signal is given; the amazons stream forth; they touch each other with the antennæ, and then the entire company sets off. The slave ants of the colony remain aloof from this movement, and do not appear to give it any attention.

Sometimes the amazons go at their object with surprising certainty; for example, if they wish to attack a nest placed on ground which they have been in the habit of frequenting. On the other hand, they easily make mistakes when they have to operate on unknown ground; at times their expeditions are unsuccessful. One day, about 4 P.M., a compact body of amazon ants was observed issuing from their abode (built by the brown ants, their slaves) on a sloping meadow. This troop descends the slope, reaches a vineyard, goes along the border of it a little way, then suddenly stops. The amazons distribute themselves in various directions; then, having come together again, they decide to continue their march forwards. After

going a little further, signs of hesitation are manifested; the company again stops, and scatters itself, one detachment in one direction, another in another; but the search is unavailing. One by one the detachments rejoin the centre of the army; then the entire column takes its journey homewards, as light as at starting. In the return, when it reaches the slope and begins to ascend, signs of fatigue are apparent, and the march is laborious. Individuals at the head of the column come back, as if to make sure that none has fallen out. At length, about 7 P.M., the amazons are once more housed. Another time, the band sets out at too late an hour. Tufted herbs embarrassing the path allow of but very slow progress; the troop changes its mind, and without apparent hesitation, returns to the nest.

It is rare, however, that the amazons allow themselves to be permanently checked by reverses. M. Forel tells us of one case in which a troop came to a field of wheat, and after exploring a part of it without success, the foragers had to return home. Next day, they set out in the same direction, entered the field, and traversed the whole of it, keeping to the right. In coming out, they found themselves confronted by a large nest of brown ants. To invade this by an open gallery was the work of a moment; and they soon came forth again, each amazon with a pupa. The last of them were chased by the brown ants. The robbers resumed their journey homewards; but instead of entering their habitation, they deposited the pupæ in a heap near the entrance, and came back to continue the pillage. The first of the column met those of the rear, and it was curious to see with what care they avoided passing too near, lest they might disturb them in carrying their burdens. The brown ants that had been robbed had, foreseeing a second assault, blocked the openings of the nest with grains of earth—a sorry resource. The amazons at the head of the troop waited till the whole body had come up; then they all rushed upon the hill, broke down the barriers, hustled the defenders aside, and loaded themselves with fresh booty. In these expeditions, the amazons will sometimes carry off empty shells, carcasses, and other useless objects, by mistake.

No colony of amazons is complete without a certain number of slaves; and though for the most part these consist of the brown ant, the red-beard ant (*Formica rufibarbis*) is as willingly taken. The latter generally defend themselves with the greater energy, but are also always overcome. One afternoon, an immense horde of amazons was marching with great assurance in the direction of a large ant-hill. Coming in sight of it, it suddenly stopped, and emissaries rushed along the sides and the rear of the troop, to form the members into a compact mass. The red-beard ants perceived the enemy, and in a few seconds their dome, pierced with several large holes, was covered with a host of defenders. The amazons, nothing intimidated, fell on the nest; the mêlée was indescribable, but, after a stiff fight, the amazons managed to effect their entrance. Just then, a multitude of the red-beard ants were observed coming out with hundreds of larvae and pupæ which they wished to save. The besiegers, however, on emerging again, were not without cocoons in their mandibles; and having satisfied themselves, they united in a body, and set off for their habitation. The red-beard

ants, now seeing them retire, followed in pursuit. The scene was most curious. One amazon, seized by the legs, would be forced to let go his booty; another, vigorously assaulted, would drop the cocoon he was carrying, to stab the individual who sought to take it. For a long time, the red-bearded ants thus harassed the amazons; but the latter, more agile, quickened their pace, and reached their nest with considerable spoil.

It would seem as though nothing could discourage the intrepid amazons. One day, in frightful weather, a column was observed on the march. Passing near a fountain, the unfortunate creatures were inundated; but the greater number managed, with much toil, to struggle over the wet grass. Coming to the side of a road, they did not hesitate to cross, notwithstanding the boisterous wind that was blowing. A little farther on, they succeeded in pillaging an ant-hill. Returning laden, they struggled along painfully amid the violence of the storm, and were sometimes even swept some distance away. Still, they were never seen to let go their burdens; and, persevering with indomitable energy, they nearly all succeeded in reaching their destination with the fruits of their toil.

There is a singular kind of ant known as the erratic ant, or the *tapinome*. When menaced, it squirts from the abdomen a volatile liquid with a very pronounced odour, which suffocates the assailant or puts him to flight. The *tapinomes* change their (subterranean) abodes very frequently, and make the transference with surprising rapidity. They are not of a warlike humour, but defend themselves resolutely if attacked.

STORY OF OLD BOB.

HALF a century ago, or thereabouts, any one who, for the sake of a short cut, walked down a certain lane connecting the two leading thoroughfares of London, might, on looking sharply about him, have seen a neat little shop devoted to the sale of small-wares. In the window were attractively exhibited cards of needles and pins, shirt-buttons, black, white, and red tapes, and thread put up in divers forms for tailors and sempstresses. The little shop, which had hardly standing-room at the counter, was kept by a Mr Robert—So-and-so—his name being of no consequence. In early boyish days he had come through a variety of difficulties, had been cuffed and kicked, and half-starved by parents, got nothing more than a trifle of schooling, and had led a sort of dog-life as an errand-boy in a business concern a good way east of St Paul's.

It is curious to note that under all these disadvantages, Bob—for we may begin to call him so—had in him, by a kind of intuition, the mind of a great merchant, and what was of more importance, he had the sense to see that no greatness can be achieved in anything, in fact, no good done in the world, without sterling integrity, and it may be considerable suffering and patience. So much in a rough way he had learned by the annual recurrence of Lord Mayor's shows on the 9th of November. Of almost every successive Lord Mayor, the story was whispered about among

apprentices and shop-porters, that the great man rolling along as a civic deity, with a splendid gold chain round his ermined shoulders, had at one time, long ago, been just as poor as any boy in the City. And further, that it was only by dint of perseverance and ingenuity in his profession, that this worshipful personage had reached his present enviable dignity.

Bob had what is called a head upon his shoulders. He saw there was a knack in well-doing. The thing could not be done by frivolity, nor, for that matter, by any special patronage, but by a self-possessed and earnest consideration of circumstances. Very good this in the way of generalisation. But what was the particular line to be followed? That is always the trying question. It was a shrewd conception when Bob fell upon the idea of making a start in a humble way with small-wares. As a shop-lad, he had not failed to observe that there is a perpetual demand for needles and pins, thread, tapes, and so forth. 'I am determined to set on foot a trade of that kind,' said the lad to himself; 'and if I am not mistaken, I could attract a lot of customers.' So resolved, and with some savings from frugality in living, the whole amount being only about twenty pounds, Bob throws himself on the world, sets up business in the narrow lane we have been speaking about. It was a bit of a struggle, but hope was in the ascendant, and there was a pleasant excitement in laying plans to get a reputation for civility, assiduity, and cheapness. Anywhere, these attractions will secure a degree of success. In London, if they become known, they are a fortune.

A reputation for extraordinary cheapness, as is understood, was the chief reliance. We are not aware of the ordinary profits on small-wares, but imagine that they are not inconsiderable, and afford some scope for giving bargains. Bob soon let it be known that his needles, and thread, and tapes were of the best quality, and very much cheaper than anything of the kind in London. To drive rivalry to despair, he is said to have actually sold certain classes of articles below prime cost. That, no doubt, was a little hazardous. It was safe only on the principle of throwing out a sprat to catch a herring. If the herring is not to be caught, the sprat is a dead loss. All depends on the likelihood of a good catch. In the locality where Bob had commenced his angling operations, the bait fortunately took. The small shop, at first fondly cherished, was insufficient to accommodate the crowding of customers, and the ever-growing stock of needles, thread, tapes, stay-laces, and shirt-buttons. Then, after due cogitation, comes an enlargement of premises, and an expansion of domestic concerns. The once obscure dealer is recognised by the neighbourhood as at the head of a thriving establishment. If he had a mind, he could be a parochial dignitary, beginning with overseer, and afterwards rising to be church-warden. His tastes, however, did not quite lie in that direction.

It might not at this mediæval stage have been easy to summarise Bob's desires. He wished to advance in business, to widen his range of undertakings, and, if possible, to get beyond the sphere of needles, shirt-buttons, and such-like matters. It

was a perfectly honourable ambition. He had begun in a way suitable to his means, but blessed with success, there was no reason why he should not stretch out in any particular direction, as circumstances seemed to direct. One of the grand features of a career in London is that you are left to yourself, with a wide scope for independence. A great thing for any one who has brains in his skull to be able to do as he likes, instead of being discouraged or kept down by narrow-minded and irresponsible neighbours. In his career, Bob did not exclude the idea of being rich, but he did not care for money in a miserly sense. His aim was simply to make the best of his faculties, and leave the rest to Providence. The possession of wealth, he knew, immensely widened the opportunities of doing good, and with this knowledge he pushed on. Of course, according to all experience, there were rocks ahead, and how to steer clear of these dangers requires no small degree of tact. Looked upon as a likely man, Bob was invited to become a member of the 'Free and Easy,' an evening club at the *Goose and Gridiron*, in a neighbouring court. The attractions consisted in good speech-making and singing, with some betting and drinking. Very pleasant, but the kind invitation was politely declined. He did not mean to pick up tavern acquaintances, although some of them were exceedingly clever fellows, with immense powers of drollery.

A very different personage was Knaggs, a solicitor with whom he became acquainted through a few business transactions, and who occasionally stepped in to have a chat about local matters. Advanced in years, and with a large practice, Knaggs had much to say about property in the neighbourhood. Dropping one morning into Bob's enlarged premises in the lane, and taking him quietly into the back-room, he mentioned that there was a capital shop to let—something which, from its conspicuous position in a leading thoroughfare, and its old-established drapery business, small-wares included, was well worth looking after. 'There's a chance for you,' said Knaggs. 'I could snap it up for you, if you say the word.' The proposal was too tempting to be rejected. Bob removed from the lane, carrying with him his old connection; and we now see him set up, not very grandly, but in a highly promising situation, in the full tide of London traffic, and that almost means the traffic of the world.

We skip over an interval of time. Forty-three years pass, during which there has been a mighty revolution as concerns Bob and his affairs. His establishment, for general retail alone, with some wholesale trade, is among the largest of its class in London. Floor above floor, and extended along the street, it is an organisation of gigantic proportions. What a row of plate-glass windows, shewing off piles of silks and satins, Indian shawls, printed goods, cambrics, lace, furs, carpets, made-up articles of female attire, and other things which we are at a loss to name. The shop, to call it so, is in itself a kind of town, or perhaps, more correctly, a huge mart of commerce. On looking in, you observe a series of counters fading far away in the distance, crowded with piles of drapery, and attended by quite an army of 'assistants,' who are ministering to hordes of customers. Intermediately, we notice a number of gentlemanly looking persons wearing white neck-cloths, who, as a sort

of adjutants to the corps, walk about to maintain discipline and to graciously hand on inquirers to the respective departments. At a side-door round the corner, you possibly observe laden wagons with goods from the 'manufacturing districts,' and also vans driving off with parcels of articles for town distribution.

Time has not wrought such marvels without leaving its mark on the originator of the establishment. He has passed through various phases in personal aspect and mode of living. Older and grayer he has undoubtedly grown in appearance, but his intellect, sharpened by exercise, is as fresh as ever. An enlargement of means has enabled him to help on beneficent undertakings. Churches and charities have partaken of his bounty. From the first, he was a warm supporter of Ragged Schools. In City affairs, when any great work is in hand, his counsels are listened to with respect. He is a fair specimen of the men to whom, generation after generation, London owes its greatness—men, we should say, of a generous nature, whose names are hardly known beyond the sound of Bow Bells. In conducting their enterprises, they every morning determine on transactions involving the risk of thousands of pounds. Their business communications are with all the ends of the earth. The post-letters they receive daily, and which are dismissed one after the other with inconceivable promptitude, would drive a country gentleman out of his senses. To the avalanche of letters by post, have latterly been added telegraphic messages, by which communications of a business nature are flying about all day long. Through the agency of those slender wires which cross the sky-line, negotiations of vast magnitude are effected in a few instants of time. With such facilities, people get through as much work in a day as their ancestors did in a month. Is not that method of cramming much into a small space, very much like a lengthening of the ordinary span of existence?

Going back to Bob's stupendous establishment, we are invited to notice what can be done by telegraphy. Directing your eye upwards to a corner of the building, you will perceive that it is furnished with telegraphic wires, to bring it into connection with some distant locality. As usual, the wires cross the murky atmosphere, and no casual street passenger thinks anything about them. They are, however, important adjuncts of the business carried on within, and affairs could not well be conducted without them. These wires are a means of communication to and fro between the acting manager on the premises and the proprietor, who now, with slightly failing health, lives in retirement some ten miles distant from town. Through the active agency of these wonderful wires, Old Bob, as he is now designated, knows as well what is going on at headquarters, as if he were sitting in a back-room with a peep-hole looking into his business establishment. So long as without inconvenience he was able to move freely about, he drove into town daily; but this recreation being now impracticable, an energetic system of telegraphic communication is substituted, and proves an unspeakable comfort. Like a commander-in-chief operating by signals, he, though miles away in the country, receives despatches, issues orders, and keeps himself acquainted with all that is going on.

Just let us take a glance at how things are

managed. The aged gentleman, true to business instincts, begins the transactions of the day at ten o'clock. That is to say, he walks into a pleasant parlour overlooking a well-shaven lawn, and seats himself in an arm-chair at a writing-table. In an adjoining closet, a youth is already engaged in front of a telegraphic apparatus, which, with sounds of click, click, click, he is assiduously watching; and ever and anon he writes down what is communicated, handing in notes to the room without a moment's delay. The intelligence is of a multifarious character, usually beginning with a report concerning letters that have been received. By way of illustration: Note of invoice of goods arrived from Manchester and Bradford; letters specifying what the whole of a bankrupt stock is offered for as a bargain for cash; letters from Lyons regarding French silks, from St Etienne about ribbons, and from Brussels about lace and window-curtains; letters from the midlands and the north about carpets; letters from Birmingham about pins, from Sheffield about needles; and letters from a well-known house in the Rue de Bondy about Parisian knick-knacks. How the old man revels in the multiplicity of intelligence. In spirit, he grows young again. Accustomed to make up his mind on the instant, he dashes off replies on the different matters brought before him; the whole affair, perhaps, involving purchases that would frighten ordinary mortals to think of.

Pretty well this for a beginning to a day's work. Leaving the youngster to attend to the machine, our venerable friend, weather permitting, takes a sauntering sort of stroll out of doors; or if that be unsuitable, he wanders into the green-house, a charming resort, with a splendid display of native and exotic flowering-plants, with a fernery at one end, and an aviary of beautiful singing-birds at the other. Here, there are rustic seats about, with a sprinkling of the morning newspapers, just brought in by the postman. While, perhaps, scanning the news of the day, the coachman peeps in to know if there is to be a drive out for an airing before or after luncheon. That being settled, back to business. From twelve to two, the click, click, click is going merrily. What delightful messages are coming briskly along the wires. 'Shop greatly thronged with ladies. At counter number three, sale of lace-flounce to Lady B., a hundred and twenty-three pounds. In the carpet-room up-stairs, five parties looking at Brussels and Turkey. Just sold a job-lot to a country dealer, two hundred pounds. Much demand for white kids, opera-season being to commence to-morrow. Two young ladies trying on silk cloaks; preference for the black drap de Lyon, with bugles. A good deal doing in Irish poplins. Old lady in the fur-room buying one of the fine seal-skin jackets, thirty guineas. Marriage-party at counter number six, examining linens; they have fixed on six dozens of Ballymena table-napkins, royal pattern. Sales till this hour, 1.30, twelve hundred and ninety-eight pounds. Would have been more, but for shower at eleven o'clock. Sun now out, weather fine; crowding on the increase, nine carriages at the door, and three footmen with powdered hair in attendance, one of them in yellow plush, and white silk stockings. Throughout the day, several inquiries as to Parisian printed muslins, and numerous large

sales in these articles. . . . Six p.m. Winding up. Business done during the day, two thousand eight hundred and seventy-nine pounds six shillings and sevenpence.'

So, there, in the evening of his days, our venerable friend, who began life in a poor sort of way, and who has never slackened his endeavours in well-doing, is now enjoying himself with agreeable surroundings in the bosom of his family; at the same time, while drawing out existence in his pleasant country retreat, he has, thanks to telegraphy, the satisfaction of still amusing himself with his accustomed business duties. These duties, however, are not his whole reliance. Notwithstanding his miserable share of schooling, he has through life been a great reader, and has now a library as choice as it is extensive. Nor is he indifferent to those refining influences and pleasures which spring from a contemplation of works of art. To his house is attached a gallery abounding in choice and costly pictures, by eminent continental and native artists. That is not all. Fond of scientific investigation, he possesses a splendid microscope with sundry appliances, with which he pursues researches in natural history, that have made a respectable appearance in the Transactions of one of the learned Societies. Then, at times, he gives some attention to the public affairs of the immediate neighbourhood. The ancient parish church, which had gone to irretrievable decay, has been replaced by a handsome and commodious edifice, fully half the cost of which was, in a quiet way, voluntarily contributed by Old Bob—known in the country as the Squire at the Hall. That is but one of many things to which he has lent a hand. A Friendly Society in the village, which, through ignorance, had been started and carried on upon a wrong principle, and which was swiftly going to ruin, has been entirely recovered by his energetic management; according to last accounts, it was in an eminently flourishing condition. That is what we call being useful in one's day and generation.

Old Bob has been lucky in his family. His eldest son, educated at Cambridge, got into parliament last election—we will not say for what borough, nor what was his complexion in politics. Possessing not a little of his father's shrewdness, he will, we doubt not, make a fair figure in the House. The second son has for some years been in the business, to which also, we are glad to know, has been admitted a grandson of the late Mr Knaggs, whose friendly counsel on a particular occasion proved so advantageous. At present, there is a talk of the accomplished daughter of our friend being married to the eldest son and heir of a baronet in next county—the lady's good looks and figure being materially enhanced by certain attractive financial considerations—but this we give merely as a piece of country gossip, which needs confirmation.

Our sketch is finished. It depicts in outline the career of one of the Merchant Princes of London, whose persevering industry, breadth of feeling, and honourable discharge of duties in the general concerns of life, bear a favourable contrast not only to the disreputable speculators on the Stock Exchange, but to those who, subordinating their faculties to their vanities, pass through existence in little better than idle uselessness and mental vacuity. In a festively eulogistic strain, we,

as a last word, have the pleasure of proposing (with all the honours), a vote of general respect and admiration for OLD BON, not forgetting to remark that he did a wise thing when he declined to be a member of the 'Free and Easy,' at the *Goose and Gridiron*!

W. C.

A CHINESE SPECULATION.

'It is a tempting offer, Mr Sin-lin-tai—very tempting!' said I, hesitating and puzzled.

'Then why you not say, Yes—one great big Yes—and let us shake hands upon the bargain!' returned the Chinese merchant promptly, but with an odd expression, as I fancied, in those long, sly, sloe-black eyes of his.

Now, the proposal in question ~~was~~ a tempting one, addressed to a poor fellow like myself, who had suddenly slipped down some rounds of Fortune's ladder. I, Frank Hepburn, bred to the sea, had lately been chief-officer of a noble clipper-ship, the *Swiftsure*, and with the certainty of becoming her captain in two voyages more. Our owners, fine old-fashioned specimens of the British merchant, had become insolvent through the failure of some bank, and their vessels had been sold for another trade. There was I, reduced to kick my heels on the quays of Shang-hai, waiting for an engagement, while my little venture, as part owner of the *Swiftsure*, was lost in the general ruin. What made matters worse was, that I was in love, and betrothed to pretty Lilian Travis, the niece of a worthy member of the British mercantile community established in that strange city that the magician Commerce has conjured up at the mouth of the great river, and that now our marriage seemed to be almost hopelessly deferred. I was thirty-two years of age, and had nothing left to me save my robust health and professional knowledge. Quite unexpectedly, Sin-lin-tai, with whom my acquaintance was of the slightest, had accosted me in his blindest manner, and had proposed that I should assume the command of a large and new steamer, the *Cassandra*, which belonged to himself and partner, and was bound on a coasting voyage to Canton and Singapore, with a valuable cargo and sundry passengers. The salary named was a liberal one, and the position, as I was assured, permanent.

It may seem unreasonable on my part, that I hung back, instead of closing eagerly with so advantageous a proposition; but then I had heard odd stories coupled with the names of my would-be employers. Ah-chang and Sin-lin-tai had, unless fame belied them, made their money through queer channels, and were deemed to be unscrupulous even beyond the average of their countrymen. Ah-chang was an enormously corpulent and silent old Chinaman, two of whose sons were mandarins; but the junior partner, who was fluent in the English tongue, was well known in Shang-hai as a pushing man of business, while both were reputed to be rich. I suppose that Sin (as we familiarly styled him in his absence) read my thoughts, for he lightly laid his claw-like fingernails on my sleeve, and said: 'Aha! Why, you say, Mr Hepburn, why Chinese give steamer to you? Just this—you got stout heart and cool head plenty much. Not do this' (imitating the action of drinking); 'and so save ship, if storm come or bad thieves come. Chinese trust you!'

I began to think it not improbable that such reputation as I had acquired for seamanship and steadiness might, after all, have been the real reason for the preference shewn to me.

A fine steamer was the *Cassandra*, glistening in all the freshness of her new paint and trim rigging, as, having acceded to her owner's offer, Sin-lin-tai took me out into the harbour to inspect the craft of which I was to be commander. Two lighters or rafts lay alongside of her, whence the pig-tailed stevedores were bustling, like so many laden ants, over her gangway. A fine ship, neat and taut, as though turned out of a bandbox, and by no means the sort of vessel likely to belong to Ah-chang and partner.

'Your chief-officer,' remarked Sin carelessly, when I had admired the mirrors and gilding of the best cabin, 'will be first-chop seaman. You know Bates?'

'Not the American? Not Brasidas Bates?' asked I, with a start. Sin nodded, but I looked and felt grave. That Mr Bates of Baltimore, known as 'Chinaman Bates' in Shang-hai parlance, on account of his taste for Chinese customs and associates, was a first-rate seaman, I could not deny. But he bore a dubious character; and had Sin and his fat partner made him their captain, with secret sailing orders to plunder and scuttle every defenceless junk he sighted, I should have been less surprised than at their selection of myself.

'Duckett,' Sin made haste to say, 'is second-officer. He your old shipmate.'

This was true, and a good sailor was Bill Duckett, when the brandy bottle was kept out of his reach, but I rather wondered that the cautious Chinese should have viewed his besetting weakness so indulgently. 'And our head engineer?' I inquired; 'and the third-mate? for three are needed for so big a steamer.'

Sin-lin-tai very handsomely left the appointment of these two functionaries to myself, and we parted on excellent terms.

Throughout the remainder of that day, and the greater part of the next, the question would keep recurring to my mind, as though some haunting demon had whispered it in my ear: Why did Ah-chang and Company seek me out to sail their steamer? Even dear Lilian's innocent joy, or her uncle's hearty congratulations, could not blind me to the fact that there must be something to account for the extraordinary appreciation of my nautical merits shewn by Sin and his partner. The sort of skippers whom Chinese shipowners like to engage are—well! perhaps are best defined as men of elastic conscience, ready to drop the honest trader at short notice, and to be smugglers, or worse, when crooked courses promise a high profit.

It so happened that my doubts were to be solved, and with a vengeance, for as I was making my way homewards, by a short cut, from the house of Mr Travis, I heard my own name mentioned, and mechanically came to a halt, close to a ruinous *godown*, or native warehouse, void of goods now, and through the rotten and breached bamboo walls of which I caught a glimpse of two persons in earnest conversation. One wore the flowing robe and satin boots which sufficiently denoted his nationality; the other was in European garb.

'We must cut his throat,' said the latter,

thoughtfully; 'for Frank Hepburn's clear grit, though I never liked the dog.'

'Must you indeed, Mr Bates?' thought I, for I had recognised my precious first-officer in the gentleman in black shore-going clothes; 'but, with your leave, there go two worlds to that bargain.'

'You do as you muchey like. You master!' answered Sin, with a cackling little laugh, for cruelty, to a Chinaman's fancy, always suggests itself in the light of a good joke. 'Perhaps more comfortable. No tales tell.'

'But,' said Bates, meditatively, 'it will be a tough job and a ticklish one. There are those forecastle fellows out of the *Windsor Castle* that you would clap on board.'

'Well, well, my dear Bates,' returned the Chinese coaxingly; 'would it do for them to say, Ah-chang and partnership no decent hand, only scum of grog-shop, and their own lascar what you call! No wonder *Cassandra* no able make fight of it in the Narrows.'

'Ah, that's it. Hepburn will make a fight of it, and those *Windsor Castle* claps will stand by him. Six brass guns, too, and a long rifled gun amidsthips! I tell you'—

'And I tell you,' interrupted the Chinaman, becoming excited; 'you flinch now, and Ah-chang say, Sin say: Bates turned coward, Bates no good; he not get ten thousand silver dollar, nor two, nor one. I say, steamer *must* be boarded, cargo *must* be taken, passenger pay ransom, or——and he ended the sentence by passing his yellow hand, edgeways, across his throat. 'And as for guns, why—— Sure some one there?'

For a bit of bamboo had cracked under my feet, and I thought it wisest to hurry away before my presence on the spot should be detected.

What was I to do? Nothing was clearer but that the foulest treachery was designed, and that life and property were alike in danger. The *Cassandra* had on board a valuable freight belonging to native merchants, who were to sail with us, along with other wealthy passengers, European and Chinese. From these latter a heavy ransom could probably, by threats or torture, be extorted; while the steamer was no doubt insured for her full value, and could probably be surreptitiously sold into the Japan or Indian trade, after her cargo had been unloaded, and the evidence of unwelcome witnesses summarily suppressed.

What was I to do? I might, by denouncing the plot to the admiral in command of the station, frustrate, or defer its execution, but that was all. It needs a strong case to procure any action on the part of the imperial authorities against a rich Chinaman, and I had but my bare word to set against the assertions of Bates and Sin. I might resign, but then, with a more compliant captain, the *Cassandra* would go to sea, and——

'Why, Hepburn, are you asleep or awake?' cried a genial voice, as I found myself confronted by an especial friend of mine, Commander or Captain Hamilton of H.M. gunboat *Wasp*, a dashing officer, and an excellent seaman, who had never forgotten, in the difference of our present rank, old schoolboy frolics shared in England. Well, I could not have wished for a safer confidant, and in a few minutes I had told him all. A long talk we had together, and when we separated,

Hamilton's parting words were: 'Leave it to me, Frank, to see you well through this.'

We sailed in fair weather, and with a smooth sea, and just wind enough to fill the white sails of the pleasure-boats that danced merrily around us. Lillian stood among the ladies on the quay, waving her handkerchief. I marvelled to myself what would have been her feelings had she known how soon the spotless deck of the *Cassandra* was likely to be reddened with blood. Ah-chang and his partner Sin were there too, to give us a parting blessing as we went out like sheep, as they fully intended, to the slaughter. But I kept my own counsel, and the rascally owners of the steamer saw in me nothing but a dupe.

There were, as I have said, sundry passengers, rich Chinese for the most part, with some Europeans, and a few ladies and children. The cabins were large and commodious, and we kept, as usual in that luxurious country, a capital table, at which mirth and merriment reigned. And all this while, as the champagne corks popped, and the piano tinkled, and gay groups chatted under the awning aft, Murder, stealthy and pitiless, lurked like a couchant tiger, ready to spring upon his prey. Bates was there, civil, silent, scrupulously attentive to his duty, but often to be seen conferring with a set of brawny, brass-complexioned mariners belonging to the Chinese portion of the crew, and whose countenances belied them sorely if they would not have been more at home on the deck of a pirate junk than on that of a respectable craft like ours. Of the European sailors, by far the most reliable were four or five stalwart A.B.s, lately discharged from the *Windsor Castle*, and in whose courage and steadiness I felt that I could trust.

From what I had overheard, I was perfectly well aware at what juncture of our voyage the peril awaited us. I knew the 'Narrows' to be the name of the most contracted part of the channel, lying between a long chain of islets and the mainland, a place notorious for outrages on the part of the numerous pirates whom the indolence or connivance of the Chinese government permits to infest the coast. Nothing was easier than for a force of determined men to lie hid among the many creeks that intersect the shore, and to assail an unprotected merchantman before their intention was conjectured.

The *Cassandra* was a swift vessel; and with a good head of steam on, and the cannon which she carried, I should have had little doubt of her power to repulse an attack, could I but have relied on my crew. With traitors on board, however, ready at a signal to assist the enemy, there could be no hope of a successful defence. The more I saw of the Chinese moiety of the crew, the less I liked their scarred, sallow faces, some of which bore the singular and undefinable expression that came of long sojourning in the Taeping camp, while all had the air of truculent marauders. Most of the Christian seamen were Portuguese—docile, swarthy creatures, but not over-warlike; while the English sailors, with the exception of the draft from the *Windsor Castle*, really were what Sin had described—the sweepings of the grog-shops on the wharf.

It needed all my self-control and command of features to maintain an unruffled aspect, join in general conversation, and avoid giving Bates, the traitor, the slightest inkling that I knew or

suspected anything. He, on his part, was discretion itself. I could tell, by various signs, that he was annoyed at my refusal to maintain a high rate of speed, so as to enter the Narrows during the hours of the darkness, which would probably have facilitated his projects; but on finding that I was firm, he accepted my decision with a tolerably good grace, and it was not until morning that we quitted the broader channel, and ran into the straits.

'How beautiful! How lovely! What sweet islands!' exclaimed the ladies who stood on the steamer's poop, admiring the effect of the rosy morning light as it played on the waving groves and dense vegetation of the many islands, of all sizes and shapes, between which and the coast we were now threading our way; and the children clapped their hands with delight as the red flamingoes and silver-plumaged ducks rose from the swamps on clanging wing. But the sight I most desired to behold was the open sea beyond, if, as was unlikely, we should be allowed to reach it in safety.

'Captain,' said the third-mate, Hardy, a brave and good lad, as he came hurrying towards me, 'there's a net—so the look-outs declare—right ahead of us, blocking the channel.'

I sprang into the shrouds, glass in hand, and one glance sufficed to confirm the youngster's words. Across the practicable seaway, from shoal to shoal, stretched a huge net, supported here and there by a line of stakes, and marked by a streak of foaming water. We were indeed in the toils, for I had heard often of this favourite device of the pirates. My best course was, clearly, to keep on. 'Run, Louis, to Mr Bradshaw, the engineer,' said I to a smart boy, the steward's lad, beside me; 'desire him to put the full head of steam on, and keep the *Cassandra* at her highest rate of speed. Off with you, and come back to report.'

The boy went, but did not return. The engines worked but slackly, and soon a hoarse, confused noise arose from below. 'Something wrong in the engine-room!' said I wonderingly. 'Mr Hardy, go below and inquire what is amiss.'

But the mate had scarcely begun to descend the ladder before he called out: 'Mutiny, sir, below. Some of these Chinese villains have'—

Then he was dragged down by unseen hands, and left the sentence unfinished; while almost instantly the screw ceased to revolve, and the steam came rushing up the waste-pipe, as the *Cassandra* floated idly down the current. A cry of surprise was uttered by the passengers, and was answered by another cry—the fierce, exulting yell of barbarians assured of an easy victory, as forth from the mangrove-fringed waters of a neighbouring creek there emerged three lorchas, their straw sails spread to catch the breeze, and their long sweeps lashing the water into froth, as the frantic rowers tugged at them; while, outstripping these, came on a score of boats, sampans, and canoes, full of wild and scantily clothed figures, who came on as fast as paddle and pole could urge their light skills, flourishing their weapons with every possible gesture of brutal menace.

I looked around for Bates. He was, as I expected, among the Chinese on the fore-deck, some of whom had overpowered the engineer and firemen, and stopped the engines, while the others were obviously preparing for a rush aft. Then I

threw a glance at the approaching pirates. 'If Hamilton is unable to keep his promise, Heaven help us,' said I, with a groan, as my eye ranged over land and water, without seeing aught but what was hostile. 'They shall not, anyhow, say that I failed to do my best.—Cast loose that gun,' I ordered, pointing to a brass carronade; 'train it forward, and when I give the word, fire!'

The pick of my English crew obeyed, as sailors do obey when they respect their officer; and the advancing Chinamen, in whose hands now gleamed knives and swords, drew back as they were confronted by the threatening muzzle of the cannon.

'Chicken-hearts!' thundered Bates, who was a really bold villain, and he added some words in Chinese which revived their courage.—'You'd best give up, captain. It's no use. I spiked every gun of the lot with my own hands.'

'I know you did, you traitor!' shouted Duckett, the second-mate, suddenly emerging, armed to the teeth, from the cabin hatch; 'but Captain Hepburn and I were clever enough to set all right without your being the wiser. Ah! you thought me stupefied, did you, with the drugged liquor? You're mistaken, my hearty, for I pitched brandy and opium overboard together, and'—

Before the second-mate could complete his speech, Bates had drawn his revolver, and fired three shots, the first of which grazed Duckett's left temple, while the third wounded me slightly in the shoulder. Bang! in answer, went the brass gun, and the grape-shot swept the fore-deck as with the scythe of death, mowing down the mutineers like grass. But already the canoes and sampans were grappling with us, and the ladies' shrieks blended with the war-cries of the pirates, as wild foras came clambering over the *Cassandra's* bulwarks, and the Chinese crew, cowed for a moment, plucked up spirit enough to renew the attack.

What was that? Surely, I could not be mistaken. It must be—it was a ringing British cheer that reached me, in the midst of all that fiendish discord, and promised hope. A boat, yes, and another, came towards us as fast as the gallant rowers could urge them with their tough ashen oars. The boats of H.M.S. *Wasp*, no doubt, for here, from behind the friendly shelter of a mangrove-tufted creek, emerges the gun-boat herself, sending shot and shell with unerring aim into the enemy's midst; so that, before five minutes were spent, one of the lorchas had sunk, and another was on fire; while the savages in the canoes were only too thankful to beat a retreat as rapidly as possible shorewards. As soon as the gun-boat was seen, and the *Wasp's* blue-jackets came scrambling up the side, the rascally native confederates of the pirates flung down their arms, and with abject entreaties for mercy, fell upon their knees, and were put in irons to await their trial at Shang-hai.

Bates, the chief culprit, lay dead upon the deck, riddled with grape-shot from that very gun which he had confidently believed himself to have rendered harmless; but we had to deplore the loss of poor Hardy and of the head-engineer, both of whom had been cruelly put to death by the Chinese mutineers, on whom had devolved the task of stopping the engines as the steamer drew near to the net spread to intercept her passage. The pirates received on that day a severe lesson, for the *Wasp* kept up her fire until the third lorch

also was destroyed, and the flames were rising from the huts of a village whither our late foes had fled.

'I've kept my word, Frank, as you see!' said Hamilton, as we shook hands, on the gun-boat's quarter-deck, after the straits had been swept clear of the pig-tailed enemy; 'but though, by means of native spies and a bright look-out, I managed to prepare my counter-ambush without yonder sea-thieves having a suspicion that a gun-boat lay hidden so close to that man-trap of theirs, I confess it was a near-run thing after all. The cunning of that Bates, or whatever his name was, in stopping the engines, was what I was unprepared for; and but for the bold face you put on it, old fellow, I should have only been in time to find the *Cassandra's* deck a shambles. To you, quite as much as to me, belongs the credit of this affair.'

So the mercantile community of Shang-hai and the naval officers of the squadron were good-natured enough to think, for, on the steamer's return to port, I found myself lionised and made much of by all, and more of a hero, I am sure, in Lillian's eyes than I deserved to be, for, after all, I had but done my plain duty. The gratitude of the merchants to whom the cargo belonged took a practical form, for not only was I presented with a handsome sum as salvage, but was appointed to command the *Dalhousie*, a fine barque in the China and Australian trade, of which I am still captain, while it is understood that on my return from my next voyage, Lillian is to become my wife.

As for the treacherous owners of the *Cassandra*, Messrs Ah-chang and Sin-lin-tsi, they at first assumed an expression of injured innocence, but were at last overborne by the evidence given by their accomplices; and finding Shang-hai too hot to hold them, decamped to some other province, having, as it was said, bribed the local mandarins to connive at their flight. As for the *Cassandra*, she was, I believe, confiscated to the use of the Chinese Viceroy, and sent up the river; but at all events I saw no more of her.

DEATHS AND DISASTERS ON THE STAGE.

IN the excited and exciting lives of actors, dancers, and singers, so constantly before admiring audiences, the feelings, nerves, and muscles are sufficiently on the strain, without the addition of extraneous agitations. Considering the amount of sword-play and other dangerous 'situations,' incidental to the efficient acting and setting of plays, and especially of tragedies, the accidents that occur are wonderfully rare. Still there have been unintended effects, unrehearsed situations, which have brought the tragedy of real life upon the stage, under circumstances calculated to cast a gloom alike over actors and spectators.

Lives have been lost, or limbs shattered, by mere accident on the stage, mishaps of a purely mechanical kind, with which the mental exertions of the performer have had little or nothing to do. Ropes, trap-doors, spring-boards, planks, scaffolding, ladders, and so forth, are naturally the cause of disaster if not properly adjusted and used; and the stage can tell many a tale on this subject.

In the old days of Lincoln's Inn Theatre, when a pantomime on the fertile theme of Dr Faustus was being performed, some of the machinery gave way; one of the actors fell, burst a hole through the stage, and was killed; another was fatally wounded; and a third broke his thigh. Early in the present century, when Mademoiselle Aubrey was playing before the Empress Josephine at Paris, she fell from a glittering piece of stage-carpentry called a *gloire*, and broke her arm; while Mademoiselle Lebrun, a ballet-dancer, fell from a gold-bespangled chariot which was carrying her up to a splendid Mount Olympus, and broke her leg. In our own day, if a Blondin or a Leotard has escaped, imitators of those performers have met with many a disaster, some fatal in their result. On too many of these occasions, the accidents have been rendered all the more distressing by the victim being of a sex ill fitted for such exhibitions—women engaged in unwomanly athletics. More terrible still are the burnings which occasionally take place on the stage. Dancers, with wide-spreading skirts of gauze and muslin, are in much danger from the gas-lights placed near the side-scenes—witness the case of poor Clara Webster, who lost her life in this way while performing in the ballet of *The Revolt of the Murem*, at Drury Lane Theatre.

Some of the accidents are due to the performers themselves, rather than to the machinery or stage-appointments. Too much enthusiasm, or too little caution, may bring about stage-effect not at all wished for. The Roman actor Roscius, while performing the part of *Atræus*, was so unnecessarily energetic in wielding a sceptre, that he gave a brother-actor a blow that killed him. Another, when performing *Ulysses*, was accidentally killed by a too-ardent Ajax. In more modern times, when Baletti was performing *Lelio* in *Camille Magicienne*, he was shot in the thigh by a brother-actor, who took up by mistake a loaded blunderbuss—a kind of accident that has occurred more than once since. Farquhar, when acting *Guyomar* in Dryden's *Indian Emperor*, killed a brother-actor with an over-vigorous sword-cut. Mrs Bellamy, as an Asiatic heroine in *Tamerlane*, gave an unlucky poke in the eye with an unguarded foil to Lee, who was performing *Axala*, and nearly blinded him. The great French actor Baron, while performing *Diégne* in *Cornille's Cid*, wounded himself in the toe with the point of a sword; he would not permit amputation, as it might damage his acting and his personal appearance; and so the over-proud man died of gangrene in the hapless toe. Le Kain dislocated his foot while acting *Briseis*, and brought on a malady; this was so increased by his subsequent intensity while acting in Du Guesclin's *Vendôme*, that he died in consequence. Woodward the comedian jumped from a (stage) table when acting the part of *Scrub*, and sustained an injury from which he never recovered. When a German actress was performing in Lessing's *Emilia Galotti*, she fell heavily from the arms of

Avoardo (one of the characters in the play), and struck her head with considerable force against the stage; she died ten days afterwards.

Instances are on record in which performers enter with such fervour into the story of the play, or the portraying of an individual character, that their hearts or brains become affected in a way never intended. A performer of the character of Lusignan, in Voltaire's *Zaire*, allowed his feelings to run riot in the scene where Lusignan blesses his children; he became so forcible and impetuous that he fainted on the stage, and died soon afterwards. Over-excitement and exhaustion together, caused the death of a leading actor in the time of William and Mary; he was taken ill during the fourth representation of the long and fatiguing part of Cyaxeres, in *Cyrus the Great*, and died on the stage during the fifth. In the early half of the last century, there was a performer familiarly known as Fat Hulett; he often overstrained his lungs, and doing this once too often, broke a blood-vessel, and died in consequence. The same fate befell the French actor Brécourt, while performing the rôle of Timon. In the time of Louis XIV., when Mademoiselle Champmeslé was acting in *Oreste et Pylade*, she was so exhausted on the fourth representation of a long and fatiguing part, that she was taken ill on the stage, and died from the malady which supervened.

Not immediately connected with the character represented at the time, but thinking more of the audience than of the drama, performers have in some instances been affected in a distressing way. To be killed with joy is not unknown in the profession. Angeleri, a Milanese actor, was so excited by the applause he met with on his first appearance at one of the Italian theatres, that he fell down at the side-scenes and expired. To be killed with mortified pride is also known in the annals of the stage. At Caen, about fourteen years ago, Madame Faugeras was suddenly called upon to enact a character, in Anber's *Diamants de la Couronne*, which had been allotted to another vocalist. She acquitted herself well under somewhat difficult circumstances, but a slight hiss was heard amid the applause; she suddenly fell down in a fainting-fit, and expired soon after being conveyed to her own residence.

Many cases are on record in which performers have been struck with paralysis or apoplexy on the stage. Molière, when acting in his celebrated comedy of the *Malade Imaginaire*, was seized on its fourth representation with a convulsive attack; he tried to conceal it with a laugh, and went on with the part, but sunk into the grave a few days afterwards. In this case he had been warned by his friends, and advised to desist from acting for a time; but he did not like to interrupt the run of a new piece which was likely to benefit the manager and the company. The actor Montfleury had an attack of apoplexy on the stage; so likewise had Mondory, when playing Hérode in the drama of *Mariamne*; he resumed the stage again, but before long broke down altogether.

During the time of George I., an actor named Spiller was struck with apoplexy on the stage of the Lincoln's Inn Theatre. About twenty years later, at the Norwich Theatre, Cashel the actor was similarly seized, while performing the part of Frankly in the *Suspicious Husband*, and died in a few hours. Near the close of the reign of George II., the celebrated Mrs Woffington, the kind-hearted 'Peg Woffington,' was one evening enacting the part of Rosalind in *As You Like It*; when she came to the Epilogue, she was suddenly rendered almost speechless by paralysis, and never fully recovered. Foote the comedian was a man who would have joked even under the gravest circumstances. Although struck with paralysis while acting in his own farce of the *Devil on Two Sticks*, he continued his habit of punning and practical joking during the few remaining months of his life. Being recommended to go to France for the improvement of his health, he stopped awhile at Dover, and went one day into the kitchen of the inn where he was sojourning, to 'chaff' the cook. He told her she must have been a great traveller, for he had heard that she had been all over Greece [grease]; she declared she had never been ten miles from Dover in her life. 'That must be a fib,' he returned, 'for you have often been seen at Spit-head.'

Later years have not been without their instances of sudden attacks of illness on the stage. Miss Linley, related to the Sheridans, was struck fatally at Bath while singing 'I know that my Redeemer liveth,' in Handel's *Messiah*. When Baldeley was acting Moses in the *School for Scandal*, at Drury Lane Theatre, he was suddenly taken ill, and died soon afterwards. Mrs Pope, an actress of some eminence in her day, was seized with an apoplectic fit while playing Desdemona, and was lost to the world a week later. Lucca Fabras, a singer at the San Carlo Opera-house at Naples, broke a blood-vessel while attempting to reach a note above the compass of his voice. Two sterling comedians, Furren and Harley, whose acting is still fresh in the memory of men in middle life, were attacked with paralysis while on the stage. The former played afterwards, though symptoms of the affection were painfully visible; he was playing Old Parr when seized. Harley's attack came on while he was acting Bottom, in *A Midsummer Night's Dream*. It is said that his dying words, uttered unconsciously, were some of those which Shakespeare puts into the mouth of the redoubtable Bottom the Weaver—'I have an exposition of sleep come over me.' Somewhat similar was the case of Powell the actor, who, when on his death-bed, became suddenly animated, put himself as nearly as he could in the proper theatrical attitude, and gave utterance to the well-known line in *Macbeth*—'Is this a dagger that I see before me?'

The death of the elder Kean was peculiar in many ways. He virtually received his death-stroke on the stage, though he survived a little longer. His irregular mode of life had weakened his health, impaired his memory, and destroyed his elasticity of spirit; he had been troubled, too, by the determination of his son Charles to take to the stage as a profession, against the parental wish. The resolve being fixed, the father agreed to give the son an introduction to the public, by playing Othello to his lago. The performance took place on the 25th of March 1833. The great actor was

tamer than usual. The audience waited for the bursts of energy with which they had so long been familiar; but waited in vain. The accounts do not exactly agree as to the precise passage which was destined to be the last uttered by him on the stage. We are inclined to think it was—

Oh, now for ever
Farewell the tranquil mind;

saying which he broke down, became speechless, and was led off the stage. Mr Bartley solicited the indulgence of the audience for a few minutes; but when it was found that the great actor could not reappear, Mr Warde took the character of Othello during the remaining scenes of the play. Virtually an old man at the age of forty-five, Kean lingered awhile, and finally sank. His funeral was attended by a larger number of theatrical celebrities than were, perhaps, ever before assembled at one time in one place. Though a man who had given way to intemperate habits, Kean had endeared a large circle of acquaintance to him. Among the pall-bearers and mourners were Braham, Macready, Farren, Cooper, Harley, Charles Kean, Sheridan Knowles, Bartley, Keeley, Wrench, O. Smith, Strickland, Webster, Fitzwilliam, Vining, Anderson, and Frank Matthews; while the humbler members of eight different theatrical companies followed in the train.

The actual deaths upon the stage, without a moment's warning, are of course more sad to contemplate, and more impressive to those who witness them. Rather more than a century ago, at the Norwich Theatre, Peterson the actor was performing the part of the Duke in Shakespeare's *Measure for Measure*. He had to address Claudio in the words:

Reason thus with life;
If I do lose thee, I do lose a thing
That none but fools would keep—

when he suddenly dropped into the arms of Moody, who was acting Claudio, and expired. These words, having so impressive a meaning at such a time, were afterwards engraved on his tombstone. John Palmer, an eminent tragedian towards the close of the last century, was engaged on what proved to be the last evening he was destined to live, in acting the character of the Stranger, in Kotzebue's drama of the same name. He had recently heard of the death of a favourite son—news which unnerved and agitated him. In the fourth act of the play, Baron Steinfort obtains an interview with the Stranger, recognises him as an old acquaintance, and asks the cause of his seclusion. The Stranger replies that he has left his children at a town hard by; and then exclaims: 'O God, O God! there is another and a better world.' Palmer, directly he had uttered these words, fell down dead at the feet of the actor who was performing the part of Baron Steinfort.

Two more instances of these unrehearsed, unforeseen tragic stage-effects. About sixty years ago, an actor named Cummins, in a drama in which he was performing, had to deliver a speech ending with the words:

Be witness for me, ye celestial hosts;
Such mercy and such pardon as my soul
Accords to thee, and begs of Heaven to shew thee,
May such befall me at my latest hour.

Scarcely had the words fallen from his lips, when

he fell down dead upon the stage. Only a year or two ago, M. Victor, a comedian at a provincial theatre in France, fell down on the stage while performing a comic character, and expired almost instantly.

JACK FROST.

THE following useful hints respecting severe winter weather appear in the *Daily Telegraph*.

'English weather is so uncertain, that the extremes of heat and cold always take the mass of the people unawares and unprepared. In other countries, long spells of iron frost, to which our present experience is mild, are borne by the well-used inhabitants without harm. The Esquimaux grows fat in the long arctic nights which keep the mercury frozen; the Chinaman takes his thick dresses out of pawn, and puts one on the top of the other, till he is a bale of wool. The Scandinavian and the Canadian poor have a hundred skilful methods of fighting the frost. In Kamtchatka, the fish-eating races occupy subterranean apartments in the winter, where they are as warm as rabbits; and a Laplander or a Siberian never allows himself to suffer from cold, like the ill-informed poor Londoners, who shiver in unfit clothing and absurdly constructed houses, without understanding exactly why the winter kills them. In the all-important matter of food, for example, there is nothing more nutritious and warmth-giving than pea-soup and peas-pudding, yet, though the best split peas can be obtained at 60s. the quarter of 550 lbs.—that is, about nine pounds to the shilling—how many poor housewives buy this life-sustaining pulse? If it seems not "genteel" enough for the pride which often goes—and usefully too—with poverty, there are lentils which can be bought for a very little more, and are yet the food of Eastern kings and queens; and, as among the best flesh and heat givers known to man, are looked upon abroad, and not without reason, as far superior to the best wheat. Fish, again, is a description of food always cheap at this time, and most sustaining, and it must be remembered that the best fuel in winter is a well-filled stomach. As to clothes too, how many poor mothers recollect that they can get cotton wadding in sheets for a few pence, and that if they quilt this in between the lining and the cloth of their husband's and their children's garments, they have something as good as the costliest fur to keep JACK FROST away? At night, it is no bad plan to put a blanket of brown paper under the counterpane. Once more, every one must remark that a favourite article of winter-clothing for children among the poor is a comforter swathed round the neck. This is a sumptuary error: the feet and wrists are the proper members to keep warm; the nose and throat will harden into healthy indifference to cold; but that muffler exchanged for an extra pair of thick socks and knitted gloves, would preserve a boy or girl really warm and well. Bronchitis and sore throat have declined fifty per cent. since the absurd use of high collars and twice-round neckerchiefs went out of fashion; and if the poor would take better care of their children's feet, half the infantile mortality would disappear. It only costs twopence to put a piece of thick felt or cork into the bottom of a boot or shoe, and the difference is often between that and a doctor's bill, with, perhaps, the undertaker's besides.'

CHAMBERS'S JOURNAL

BEGINS a new year, and an opportunity occurs for making a few editorial observations. As the work commenced in February 1832, it is now almost forty-four years old. It is a long time for us to look back to the memorable day in the reign of William IV., when the first number made its appearance. Life was then young, with hope in full buoyancy, but hope not unmingled with anxiety respecting the success of our venture. It happened to be successful far beyond expectation, and after pulling at the oar for more than half a lifetime, we find the original current of approbation to be undiminished. That, we humbly submit, is something to be grateful for, and to be fairly proud of.

This continued popularity of CHAMBERS'S JOURNAL is the more surprising when we keep in mind the vast number of competitors which first and last have succumbed. *The Penny Magazine*, which began six weeks or so after the *Journal*, and which was ushered into existence under the highest titled and literary patronage, perished after a run of fourteen or fifteen years—a remarkable example of how little value is any mere factitious recommendation, or any flourish of great names, in the way of patronising. We, who had no special patronage at all, and did not want any, have outlived *The Penny* about thirty years. We might say the same thing of dozens of cheap periodicals, less or more formed on our model, or professedly with similar objects in view, and which might never have been in existence had we not pioneered the way. The failure of so many competitors, not a few of which, from their appearance, deserved to succeed, has always been to us a little perplexing. Their break-down was certainly not owing to anything we either said or did. From the first we held out the hand of fellowship to all whose aims seemed to resemble our own. Among our agreeable recollections are included a friendly intercourse with Charles Knight, and the cordial response of Leigh Hunt on tendering our good wishes for the success of his *London Journal*, which unfortunately happened to be very short-lived.

As a matter only of literary history it might be deserving of inquiry, why CHAMBERS still lives in perennial youth, when so many rivals have vanished and almost been forgotten. It is a broad question, and we would gladly leave its solution to others. A few things may be mentioned from our own point of view. The work has always been conducted with thorough earnestness of purpose, and in a spirit of independence. It has ever aimed at harmlessly entertaining and instructing apart from sectarianism, apart from political bias, apart from high-flown conventional theories. We have never cared about pleasing sects, parties, or individuals, nor of making literary capital by parading the names of aristocratic contributors. On all occasions, the work has been allowed to stand on its merits. What we have endeavoured to do has

been to meet the desires and feelings of the public; that is, all who, in a familiar and possibly amusing strain, could be addressed through a paper modest in pretensions, price, and appearance. That might be called our *raison d'être*, the charter of our existence; and as far as practicable, in the changing tastes and fashions of the time, it has been rigorously stuck to. Just as at the outset, we still address ourselves to large masses of every denomination, telling them what we believe to be the truth, and what may be useful for them to know, without any violent attack on, or a mean support of, prejudices.

Yet, the changing tastes and fashions of the time, just alluded to, have caused some difficulty. Forty-four years' teaching of the press, in which we rank only as an atom, along with numerous other appliances, have given a new aspect to the face of society. People do not now require to be addressed elementarily. The reading of books and newspapers is on a very different footing than it was in 1832, when paper and printing were subject to oppressive fiscal restrictions, that now seem ludicrous, indeed, hardly conceivable. With enlarged knowledge and the progress of wealth, have arisen tastes for what may be styled merely recreative literature. Dry information is set aside for what will afford entertainment. Beyond even this, there comes a change in fashion, expressed in the word 'sensationalism.' How to keep our ground in these progressive diversities, has needed some delicate management. Yielding to solicitations, we, for a time, to use a similitude, lightened the burden of our song; but the experiment never went with our feelings, and going back to the old and time-honoured notes, we shall be contented to let things take their chance. In a word, those giddy beings who want high-wrought sensational stories—which are nothing but the wildest rack of invention—must go elsewhere for them than to the pages of CHAMBERS'S JOURNAL. To one craving of the age we have been obliged to conform. We refer to a taste for continuous tales, extending through successive numbers. It is a novelty which would have been strenuously opposed at a time within our recollection, but to it there is nothing seriously objectionable, and we let it pass, only on all occasions taking care that the language and sentiments of the tales shall be kept within bounds.

It will be understood, therefore, that with such health and ability as we can muster, CHAMBERS'S JOURNAL will be conducted as nearly as possible on the plan originally projected, and of which the work for the past twelve months offers an example. The design is to offer a pure and wholesome literature—to cheer the invalid and the aged, to strengthen the good resolutions of the young, to stimulate and encourage habits of self-denial, industry, sobriety, and thrift, to point out what we consider to be social errors, to inculcate kindness to the lower animals, and to sympathise with and enlarge the higher sentiments of our nature. In conclusion, and as some guarantee for professions, the work is now entirely under our own guidance, assisted only by Mr R. CHAMBERS, son of the late Dr R. CHAMBERS, but with a further reliance on a large body of skilled contributors, to whom be all acknowledgments. W. C.

CHAMBERS'S JOURNAL

OF
POPULAR

LITERATURE, SCIENCE, AND ART.

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 628.

SATURDAY, JANUARY 8, 1876.

PRICE 1½d.

WHAT TO DO WITH MONEY.

ONE is at present a little puzzled to know what to do with money. Through a long course of manufacturing and commercial prosperity, along with habits of saving in all but among the uneducated and reckless classes, disposable capital has increased so enormously that there is a difficulty in knowing how to employ it to advantage; for lenders are more numerous than trustworthy borrowers. Gradually you add figure to figure at your bank account, but what signifies how many figures are at your credit? The accumulation counts for little or nothing. To know that you are worth a row of five figures may impart a certain complacency to the feelings, and if the thing gets wind, you are perhaps looked up to with admiration by those whose account is still at the rudimental item of two figures; but what good does all this come to? 'The hand of the diligent maketh rich.' Well, you have been superlatively diligent; you have schemed and toiled for fifty years, and are rich, but what to do with your riches is the question. Instead of being at ease, you are environed with troubles—a thing never contemplated when you prudently, long ago, began to economise.

This species of embarrassment accounts for a variety of phenomena. There is hardly a town in the kingdom that is not increasing at a great rate—pushing out beyond the old dimensions, and covering fields with villas. Being somewhat timid as to the possibility of getting anything to do securely and profitably with their money, people take to building a house which shall be something superior to the modest dwelling they have been hitherto accustomed to. How conspicuously is the progress of wealth demonstrated in those town and city extensions! Building or buying a house seems to be about the first thing thought of by a person who can reckon his bank account by four figures, but sometimes much less. It is a new social feature, and delightful to contemplate. Increase of towns, increase of population, speak strongly of national well-being.

A like phenomenon consists in buying land,

which is a considerable stretch above building a suburban villa, and infers a pretty long row of figures—not below five or six; but on this we will not at present dilate. As vast numbers have neither the means nor the inclination to buy 'real estate,' but must look to some simpler and more off-hand investment of savings, they try railway shares and debentures; and if these be well selected, there is a fairly moderate return—say, three to four per cent., in some cases as much as five or six. Of all the phenomena arising from accumulated wealth, railways are the most remarkable. They go beyond the building of houses or the purchase of lands. They are the wonder of the age.

But, after all, and no matter how insignificant have been the returns to investors, money accumulates beyond expectation, and remains as much a drug as ever. What marvellous industry, what thoughtful economy, what moral hardihood are revealed in this expressive circumstance! Countries with enormous pretensions, and far more highly favoured by Nature than England, never save at all. Living from hand to mouth, they are in the character of those poor and improvident neighbours to whom doles are compassionately sent to keep them from the workhouse. In these splendidly sunny, and it may be classic, regions, the people dance, sing, smoke, fight, and indulge in other mighty pleasant diversions, apparently untroubled with cares about the future.

The future! That is about the last thing that these gay communities think about. They seem to say: 'Why should we economise to make railways, to construct docks, to build ships, to erect palaces, to supply towns with gas or water? There happens to be an island eight hundred miles long, lying off the coast of Europe, and exposed to the blasts of the Northern Ocean, where the inhabitants have a remarkable faculty for saving and plodding industry, and with notions of gain, are stupidly facile in throwing away their money. They are actually at a loss what to do with their spare cash. It would be an act of kindness to take it off their hands. They are easily imposed on by

plausible pretences. Let us put on a fair front, and by lying promises, wheedle them out of a large sum, under name of a loan at a high rate of interest. What we plunder them of will never be missed. And the beauty of the thing is, that we shall not sacrifice an iota of our cherished recreations.'

And so England is speciously and systematically robbed—becomes the money-lender of the world—the prey of every shifty miserable country possessing sufficient audacity to sue as a borrower on false or visionary pretences. The ordinary method, as everybody knows, is to send round prospectuses by post to select individuals over the British Islands. He is fortunate who escapes this torrent of plausible representations to take shares in concerns that reach from half a million to one or two millions of pounds sterling. Oil-wells, mines, phosphates, guano, foreign railways, docks, sewage, and water-works, are among the projects offered to investors. How many are caught, it would be painful to consider. We would not go the length of saying that these are all sham or insecure undertakings; but, taking them in the bulk, they strikingly demonstrate the wealth on which a drain may be attempted, and perhaps not less do they indicate the amount of popular credulity. In the history of past times we have nothing at all to match the copiousness of these financial projects; because not until now have there been such vast accumulations of capital inviting the encroachment of needy schemers and speculators. Every one having a little money at command may be said to be in a state of siege, so many are the alluring devices to induce a rendering up of the savings of a lifetime. In days of old, people were apt to be plundered by highwaymen. There is now, through the agency of prospectuses, an infinitely more safe and sweeping method of carrying off the proceeds of diligent industry and thrift.

Borrowing on a gigantic scale by foreign nations of more than doubtful credit, and of which we shall have some details to offer presently, is not alone to be viewed with distrust. There is a home department which reckons on the weakness of lenders, and requires to be equally guarded against by those who are honestly looking about to make investments. Encroachments of this class are multifarious. Hollow schemes of new Banks and Life-assurance societies put forward under specious auspices, have been a formidable method of deception, bringing thousands of confiding shareholders to ruin. It is customary to blame the legislature for not establishing checks on visionary projects. No doubt, something might be done in this direction, but let us keep in mind that we are a community which aspires to be out of tutelage. We are not like continental nations, who need to be watched and directed like children, lest they get into mischief. We are presumed to be able to take care of ourselves, whether on a railway platform or the purchase of shares in commercial undertakings. That is British liberty, and let us

be proud of it, and guard it sufficiently through the exercise of all the faculties at our command.

Why should not people reason, think, consider, before they involve themselves in the responsibilities of enterprises over which they have scarcely a vestige of control? It is their own business, not that of the government. But, say the sufferers, with a truth that is almost agonising, and which we refer to with a sense of disgust: 'Have we not been entrapped by names of baronets, members of parliament, men high in social position, stuck as sponsors at the head of the prospectuses which have robbed us of our money?' Quite true; and the more shame to those who, as an act of pure folly, or it may be for the sake of some paltry gains in the shape of directors' fees, lend themselves to schemes that are too frequently worthless. What misery is owing to this pliance in permitting the use of names! The error is flagrant in all directions. Out of sheer good-nature, names are given and used as a decoy, that ought as a point of conscience to be withheld, even when the matter is greatly more insignificant than the chance of seducing small capitalists into venturing money on projects substantially rotten and reprehensible.

The depredations committed on account of joint-stock undertakings fall into the shade in comparison with what come prominently to the front as professed loans to foreign governments. For the last fifty years, England, as already hinted at, has been the lender to the world at large. Now, be it observed, there is nothing wrong in lending, if it be conducted on fair terms and for an honest purpose. It is complimentary to know that we are looked to for loans which will afford a proper return; because that would be a good way of benefiting neighbours by the excess of wealth created through our industrial operations. A trustworthy borrower is accordingly to be appreciated, and, if anything, to be cultivated in a friendly spirit. Both parties are served, the borrower and the lender. We might feel gratified in thinking that a number of countries have been advanced in civilisation through the agency of our abundance. Surely, a blessing will fall on a people who, by their thrift, have done such marvellous things in the cause of humanity!

Pity it is that along with so much good there should be associated so much evil. Half a century ago, the people of England confidently lent a large sum on easy terms to Greece, with a view to the establishment of its independence. The object was gained. Neither principal nor interest, as we understand, has been paid. The loan is a bad debt. The lenders have lost their money, and not even got thanks. A much worse case is that of Spain, which has been a large defaulter, and does not appear to be soon likely to meet all its obligations. Turkey, worse and worse. One is absolutely ashamed to think of what has first and last been done to prop up Turkey, with its incompetent rulers and utterly disgraceful management. For fanciful diplomatic considerations, and hopes the most illusory, the British government must historically bear the heavier part of the blame; but scarcely less responsible are those individuals who profusely lent money to maintain an Asiatic tyranny altogether out of place in Europe. If, in greedy expectation of an inordinately large rate of interest, lenders

are destined to lose two hundred millions or so, who will sympathise in their misfortune? In a moral point of view, they are chargeable with helping to perpetuate barbarism—and should be modestly silent.

There is still a deeper scandal and disgrace, and it falls on the City of London. The metropolis, which, as we imagine, should stand forth as an example to the nation, has latterly, through certain stock-jobbing operations, been its reproach. To the case we can only in a brief way allude.

The Report of the Committee of the House of Commons on Foreign Loans, which has been made widely known through newspaper notices, abounds in very extraordinary revelations. It leaves untouched the loans to defaulting European states, and is confined to the several loans that have from time to time been brought into the market by the governments of Honduras, Santo Domingo, Costa Rica, and Paraguay. How many millions of money were wanted it is unnecessary to say. Any one can understand that the raw and penniless countries specified could only hope to effect their object by employing an agent to secure the co-operation of contractors skilled in getting up prospectuses and in the art of 'floating a loan.' When a number of contractors are concerned in the business, they are called a 'syndicate.' It would never do to bring out a loan, and leave it to take its chance of customers, no matter how favourable the terms. The artifice consists in the contractors taking up the stock even before it is advertised, and then putting it on the market at a premium. This is a matter of immense delicacy. Every step in the process is kept profoundly secret. The object is to allure jobbers to apply for allotments of shares, in order to make a profit by selling them in what appears a rising market. The period between the advertisement and the allotment is the opportunity of the syndicate or contractors. By purchases and concerted dealings on the Stock Exchange, the loan is raised to a tempting premium; and this premium is maintained at any cost till the allotment is over. As the loan is issued at a fixed rate, say at sixty pounds per hundred, and appears to be in request at eighty, the witless jobber or outsider rushes to apply for stock on which, as he thinks, he can at once realise a profit of twenty pounds per hundred. Under this prevalent delusion, the whole of the stock is applied for, and with evidence of this fact, a quotation is permitted on the Stock Exchange. The operation of floating the debt is completed. To keep up the game, the agents of the respective governments are authorised to appear as buyers. One way or another, the public get themselves saddled with the stock, and now is developed its true value. The contractors have slipped out of their responsibilities, each pocketing perhaps a hundred thousand pounds. Down and down goes the stock in the market, till at length what was bought at eighty, is not worth more than ten pounds, if worth anything at all. In the course of operations of this kind, the borrowing governments often have cause to complain that very little of the money for which they have been made responsible comes their way. Desiring to shear, they are in the pitiable plight of being well shorn. Through a variety of stock-jobbing manoeuvres, they perhaps incur a debt for a couple of millions, of which they may not have handled more than

twenty to thirty thousand pounds. Hence, they are weighted with obligations which they have not the slightest chance of discharging, and must correspondingly suffer in loss of character.

According to calculations made by *The Times*, which has come nobly forward on the subject, it would appear that certain foreign loans, including Turkish, of which the issue price amounted to a hundred and fifty-seven millions, are now worth only eighty millions. The difference, seventy-seven millions, has not, perhaps, been all lost by the public, for a portion of the loss has probably been incurred by agents and contractors. But after making deductions on this score, the sum of 'sixty-two millions may be set down as lost by investors of one class or another. That,' it is emphatically added, 'is a very large sum to take out of the savings of the public in less than four years, and when all allowance is made for the strength of popular credulity or greed, it remains a sufficiently marvellous thing that it could be so readily parted with.' An average loss of upwards of fifteen millions a year is certainly wonderful, but that by no means expresses the entire depredation; for, concurrently, there has been no end of abortive joint-stock undertakings, and it might not be too much to say that the loss to the people of Great Britain by bad investments reaches twenty millions annually. We should doubt if all the booty carried off by highwaymen during the last hundred and fifty years reaches a twentieth of the amount.

The system pursued in too many cases of foreign loans can be described as nothing else than gambling—gambling, we might say, with loaded dice, for the victims are denied any knowledge of the fact, that they are sure to lose. We refrain from characterising in all its disreputable features the process of enrichment at the cost of greedy and weak-minded dupes. One remark may suffice. What strikes every one with surprise is, that men who attain to enormous wealth by the devices referred to should be admitted to social intercourse among the courtly and higher ranks in the metropolis. Has it come to this, that opulence, no matter how obtained, suffices to place any one on the platform of honourable society?

While recognising the terrible evils inflicted by the usual methods of floating the loans to States of doubtful solvency, the Committee making the investigation shrink from offering any specific remedy. They hint at some reforms as concerns the Stock Exchange, and counsel greater caution in applying for shares. That is all. People with means for investment, as we have already observed, must therefore think for themselves, or, at all events, trust only to individuals in whose good sense and integrity they have reason to feel confidence. As a general truth not to be neglected, the promise of more than four or five per cent. is unsafe; for scarcely any more can be offered in wholesome undertakings; and the tendency, as has been observed, is a progressive lowering of the value of money. In short, high interest means bad security. Have nothing to do with promises of ten per cent. and upwards. Be jealous of projects beyond the limits of Great Britain and the colonies. Shun railways, mines, and other undertakings in the United States. Be on your guard against all overtures from South American Republics. On the whole, it comes to this, that persons who wish to avoid possible losses and cares which make the

heart sick, must considerably moderate their expectations of gain. How melancholy to reflect that in GREED, along with efforts to overreach, we have the vulgar outcome of national prosperity, and that perplexing condition of affairs—What to do with Money! W. C.

FALLEN FORTUNES.

CHAPTER II.—TEACHER AND PUPIL.

THERE are no doubt attractions of a sentimental kind that cling to fine old country-houses, with which no other habitations can compete. 'I like your England only pretty well,' observed an American lady to me on one occasion; 'but I do love her ruins.' Historical association was what her own land did not possess, and she valued it accordingly; and, indeed, it has charms for most of us. It is something to dwell under the same roof which has sheltered Queen Elizabeth in her progress, or Charles II. in his wanderings; and perhaps even to sleep in the same bed that was once occupied by the Royal Martyr. But there are objections to these stately ancestral homes, which make them more pleasant to 'go over' as a tourist, with a half-crown in your hand, destined for the housekeeper, than to reside in as a guest. The rooms are stuffy, and the ventilation most observable in draughts under the doors; the windows are small, and do not conveniently open; there is generally a reputed ghost or two—which, however much we laugh at in broad daylight, is apt to appeal more strongly to the imagination, when we are lying awake, during the small-hours, in an antiquated four-poster. Lastly, the 'Castle,' or 'Hall,' or 'Tower,' or whatever imposing name it may bear, though generally what the auctioneers term 'finely situated,' is by no means always placed in the most picturesque spot of those which its extensive lands afford for building purposes. In the good old times, when everybody was for interfering with his neighbour, or for avoiding being interfered with, the architect of the period was more intent upon preserving the personal safety of his employer, and making him inaccessible to the general public, than in providing him with an attractive outlook, and we often sigh, as we contemplate some stately home, moat-ringed—as though wedded to old Time himself—'Oh, why was it not built there or here!' It is for these reasons that I prefer to be a guest—for in my wildest dreams I have never pictured myself as the proprietor thereof—at some modern mansion, though owned perchance by a City millionaire of yesterday, than to be entertained in what I have heard a certain gilt but irreverent youth—himself the lord of such a feudal residence—term a 'ghost box.' I can fancy few pleasures more solid and satisfactory than that of going about this fair land, with a hundred thousand pounds or so in one's pocket, looking out for an estate with an eligible site to build a house upon after one's own fancy—or perhaps still better, to purchase one ready built. George Campden—a

fortunate man in many things—had been lucky enough to find in Riverside a ready-made residence that suited his taste exactly, save in some particulars which his riches easily enabled him to make conformable to it. It had been built but a few years by one who had risen on the flood of Fortune only to be dragged down with its ebb, and yet it had no objectionable trace of newness. How could it do so, indeed, when the flinty bowels of old Bleabarrow had supplied its walls, up which the creepers had been as prompt to climb, as heath and wild-flower were to deck the crags themselves?

There was an affinity between stone and plant at Riverside Hall, which I have seen nowhere else, and which made the whole edifice less like a production of art than of nature. Yet art, and that of the most modern kind, was everywhere visible about it, from the divan-like billiard-room with its electric marking-board, to the gilt gas-lamps marking the garden-path that led to where the steam-yacht was housed—a boat-house like a Chinese palace. The lamps were by no means superfluous, though the steam-yacht might certainly have been termed so, since it was only after much rain that the Nathay would admit of its reaching Bleabarrow Mere, under pretence of navigating the waters of which that ambitious vessel had been purchased; but the sailing-yacht, which the Chinese palace also contained in addition to half-a-dozen pleasure-skiffs, was often put in requisition; and after a late picnic, or protracted voyage, the miniature lighthouse at the head of the boat-landing was useful enough, and the lamps beside the winding pathway saved many a bed of costly flowers from invasion and damage.

The house was built upon elevated ground, that gradually sloped up to it from the river; but at its back, and sheltering it from the north and east, a hill arose, so high that it could be almost termed a mountain, and yet so fertile that great trees grew almost to its summit, beneath which the insatiable sheep cropped the rich grass; while lower down clumps of tame deer wandered from shade to shade, with twinkling ears. The whole place, without and within, displayed that perfection and wholeness which is only possible in a country residence when its possessor has large supplies of ready-money. It was Mr Campden's boast, that if anything went amiss, from the bursting of the kitchen-boiler to the breaking of a window-pane, the mischief was repaired upon the instant.

'Ten squires, ten yeomen, mail-clad men,' might not indeed wait 'the beck of the warders ten;' nor 'thirty steeds, both fleet and wight,' stand 'saddled in stable day and night,' as the poet tells us 'was the custom of Branksome Hall;' but there were steeds and serving-men in plenty at Riverside; and man and horse were despatched to the county town with equal speed, and certainly on much less emergencies than were wont to send them forth from that Border tower. No guest ever had it brought home to him that he was sojourning at a country-house, from the occurrence of an inconvenience that extended beyond the hour; while

every luxury was supplied to him that London could produce. Even the lettuces in the salads were almost as good (though, if there was a weak point in the Riverside commissariat, it was that which is common to all country places whatsoever—the lettuces) as those bought in Covent Garden itself; while the asparagus was infinitely better. Not a bottle of champagne was ever opened that had not been duly iced. The daily papers arrived by express at 4.30 from the nearest railway station, and from it was a branch telegraph to the Hall, by which the morning news came down, and was found upon the breakfast-table by the earliest riser. The guests of the house descended to that meal at any time they pleased, or, if they preferred it, had it served to them in their own apartments; but the hours for lunch and dinner were absolutely fixed (as they must be, if the cook is to respect his art), and were stated on a printed card, and hung up in every bedroom, as prices are at hotels. The wheel of existence was made, in short, to move so smoothly at Riverside that you forgot the mechanism of strap and cog that are in general so plainly visible, and were apt to take that as a matter of course which was in reality the result of infinite pains and provision. When you shifted your quarters, it is true your mistake was immediately rectified; but it was said, and said truly, by those who had experience in such matters, that to be a guest with the Campdens 'spoiled you' for visiting anywhere else.

What gave Riverside an advantage, however, it must be confessed, in such a comparison was, that it stood almost alone in being essentially a *summer* residence. Although the estate was large, there was little game upon it, and that little—the proprietor being no sportsman—was not preserved. Hence, when the house was at its fullest, other country mansions were standing empty, their fashionable owners having gone on the continent, or yachting in the Mediterranean; and when the hunter's horn, or the whirring wing of the pheasant, sounded their recall, Riverside in its turn became vacant of guests, and the Campdens came up to town for the winter months. Sometimes their daughter Mary would precede them by a few weeks, which she would spend with the Daltons in Cardigan Place; and sometimes she would tarry behind them, to enjoy 'the season' a little longer, under the auspices of the same hostess.

The two families, though they called themselves cousins, were only distantly related, but they lived in great familiarity and friendship; Kate Dalton, in particular, felt almost as much at home at Riverside as beneath her father's roof, and especially on the present occasion, when her 'belongings,' as she called them, were her fellow-guests. She had often stayed there alone, just as Mary Campden—her dearest friend, though she was her senior by two years—had stayed at Cardigan Place; but the fact was, she was never quite happy when away from her family. Her mother, whom she adored, was herself in delicate health, while her sister Jenny was a confirmed invalid, afflicted with a sort of chronic neuralgia, which at times made any movement of the limbs intolerable; and Kate was eager to do her share of tendance, and also to take Tony off their hands during his holidays, whose animal spirits, though he too was far from physically strong, were at times not a little 'trying.' It was from their mother that the children, doubtless, all

inherited their delicacy of constitution, for Mr Dalton was never known to have had 'anything the matter with him,' in wind or limb: but for a certain nervous and impulsive temperament, which was common to them all, they had to thank, or to blame, their father.

Under an appearance of the most perfect *sang-froid*, it was asserted by those who ought to have known him best, that John Dalton concealed a sensitive and passionate nature, and that, though he was the most popular man of his day in clubs and on business committees—two very different characters rolled into one—he could shew 'a deuce of a temper' when displeased. As his wife and children evidently loved him to excess, however, it is charitably to be believed that these paroxysms, if he really did indulge in them, were rare and short-lived. He has not yet arrived upon the scene in person, but we may make some guess at his character from a specimen of his correspondence, perhaps.

The morning letters, despatched in a private bag by express from Bleabarrow, arrived early at the Hall, and having been taken out of their repository by Mr Marks, the butler, were carried up to their respective owners.

'There is a letter from master, inn'am,' observed Mrs Dalton's maid, as she entered her apartment, and laid the missive in question on the dressing-table, at which that lady was already seated. It was perhaps impertinent in Lucy to say as much, but she has been many years in her mistress's service, and is well acquainted with all her ways, and even with some of her thoughts. She concludes, for example, that she has risen so early this morning from her anxiety to hear news of her absent husband; and she is quite right in her surmise. Mrs Dalton takes the letter quickly, and without any fashionable pretence of not being in a hurry to possess herself of the contents, yet opens it with a certain neatness of touch, of which characteristic no haste can deprive her. Nay, she even takes the opportunity of Lucy turning her back to set down the hot-water can, to press the handwriting to her lips before reading it, like one saying grace before good food.

BAMPTON, August 1,

began the note, which was indeed but a hurried scrawl.

'MY DEAREST LOVE—You will see me to-morrow without fail; I hope by the train that gets to Bleabarrow at 6.30. Holt was over-sanguine, it seems; and they tell me if I get in here at all, it will be a tight squeeze. The people are a roughish lot' (Here the delicate pink fades from the wife's cheek, as when you suddenly remove the light with which you are shewing off your cup of egg-shell china: 'Good Heavens, there is danger then!' she thinks.) 'I have been soliciting their sweet voices for five hours to-day, at one place or another, and am dead-sick of it, and as house as a raven. The whole affair is what Julia would call "quite too awful." I do not myself think I shall succeed, and unhappily it is of great importance that I should do so. Do not say anything to Holt of this, however. Kiss my dear ones for me, and tell Jenny I found a fern for her,—while I was out canvassing,—which seems to me to be rare; but I daresay it will be at once detected by her learned eye to be something *communis*.

'I shall see you to-morrow, sweetheart, whether I shall have to be congratulated or consoled; that is something; but "would it were supper-time and all were well."—Ever yours, JOHN DALTON.

'P.S.—Don't say a word to Holt, or anybody, of my misgivings.'

Mrs Dalton read this letter again and again (there were things in it that puzzled her, such as the reference to supper-time. 'I hope he is not hurting himself by taking suppers, which never agree with him,' was her mental commentary upon that passage); but she knew those were not of importance: what gave her most uneasiness were the allusions to Mr Holt, whose name was mentioned no less than three times.

Mr Holt was a stock-broker, as Kate had told her friend; but even if she could have answered her general inquiry as to what a stock-broker was, which is doubtful, she could certainly not have explained the nature of the calling of Mr Holt in particular. Few persons, indeed, could have done so. His doings were by no means confined to scrip and share; he had a finger in every pie from which 'plums' are picked; and wherever there were wires, it was his aim to pull one. His influence over her husband, Mrs Dalton was well aware, was great, though she did not know how it was obtained. It seemed to her very strange, and almost humiliating, that her John, who was so clever and brilliant, should allow himself to be persuaded into this and that by such a blunt, plain man as Richard Holt, one rather younger than older than himself (though he did not look younger), and who had nothing to recommend him beyond a character for shrewdness. She would have been indignant with any one to whose opinion her husband had deferred; but the influence of this man was peculiarly obnoxious to her, since it had drawn him into business and politics, which she detested, because they took him so much from her and home. She had hitherto seen no other evil in them, and certainly no danger; but a phrase in her husband's letter, or rather a word in the phrase, had now excited her apprehensions. 'I do not myself think I shall succeed' (that is, in being elected for Bampton); 'and, unhappily, it is of great importance I should do so.' Of course it was important that John should get into parliament, but why should he have written '*unhappily*, it is of great importance?' He was wont to write rapidly—to dash off his words, indeed, as fast as his pen could form them—but he rarely used an unfitting word, or a superfluous one. She had not thought so much of John's becoming a senator as most wives equally devoted to their husbands would have done, but that was because she had so high an opinion of his talents, reputation, and social position, that no adventitious distinction could, in her eyes, make him a greater man. It was simple in her to think so much of him, but it was singularly becoming. It had been once said by a very great reader of mankind—one who had studied 'each mode of the lyre' of human life, and had 'mastered them all,' that Mrs John Dalton was 'the nicest woman in England;' and though that had been said at a time when she was one of the prettiest, her niceness had not departed with the years. It might almost have been said that her prettiness had remained with her also—as one sees her standing now, with that letter in her hand, but

gazing thoughtfully through the opened window; only '*prettiness*' could not have expressed that matured grace. Her once golden hair no longer ripples in bright waves, and is streaked here and there with silver; her slight form has lost its comely outlines, and her whole appearance denotes fragility; but the love-light in her eyes shines out as clearly as in her bridal days, and burns with that sacred flame which years of constancy and trial alone can give it, and which no loss or cross can ever extinguish; a saint as holy and as pure as any virgin of the cloister; a guardian angel set in the niche of Ilome.

She had not thought much, I say, of how things might go at Bampton; but now that she heard that they might go *unhappily*, her feelings changed, and the matter assumed that '*great importance*,' though she knew not on what account, that it wore in her husband's eyes. Every one said, and justly, how kind and unselfish Mrs Dalton was; how tender to misfortune; how gentle as well as liberal to the poor; how ready and eager to heal family differences. She had been appealed to more than once to intercede for a spendthrift son, and once even for a runaway daughter; and not in vain; and yet she only lived for her husband and her children. Her heart was open to all the world—it was difficult to close it against even the wicked; but in her heart of hearts were the images of those four beloved ones set up alone as idols. 'God and my country,' was not her motto, though, perhaps, she would have gone as far to serve her country as the foremost of our female politicians; but simply 'God and my dear ones;' for them, however, she would have laid down her life without a sigh.

To no purpose she ransacks her mind for any sign that might point to the cause of John's anxiety about this election; it would cost him some considerable sum of money, she was aware, but she also knew that he had calculated the cost, and had the money to spare. It was not usual with him to confide his business affairs to her; but he had told her so much as that in answer to her gentle expostulations against his embracing political life at all. The '*unhappiness*' could therefore have nothing to do with money matters; and yet it had certainly to do with Mr Holt, whose connection with her husband was based solely upon them. They had nothing else in common, she was quite sure. She had her doubts whether they were even quite good friends, though they were thought to be so by everybody. Indeed, she was aware that Mr Campden had asked Mr Holt down to Riverside entirely upon her husband's account, and, as she suspected, even at his express request. '*Do not say anything to Holt, however,*' read she again. But why should she say anything? Why should John suppose that she should have spoken to the man about his private affairs at all? He was a person, as her husband well knew, for whom she had no liking, and whom she kept at as great a distance as politeness permitted; so that the injunction was quite superfluous; and yet it was repeated in his postscript. 'Don't say a word to Holt, or anybody, of my misgivings.' She would not, of course, say a word to anybody, since he had forbidden it; but without that warning, she would certainly not have dreamed of saying one word of John's affairs to Mr Holt.

Mrs Dalton has done with her letter at last, and

every line of it having been committed to memory, places it in her bosom; then calling up a smile upon her face, she opens a green-baize door, and knocks at another door behind it.

'Come in, dear mamma,' answers a cheerful voice; and she enters the neat room accordingly. This is a luxuriously furnished apartment, hung with pictures, lined with books, and evidently not intended as a sleeping-room; yet there is a charming little bed in it—with rose-coloured curtains hanging upon it like a tent—and also an article of furniture that looks like a second bed, though it is only a reclining couch of peculiar construction. Upon this latter, a young girl of about sixteen is lying, propped up with cushions, at the window, and apparently sketching the prospect it affords.

'What! up and at work already, Jenny? Surely that is not prudent, my darling!' There is a look of pain but not of reproof upon the mother's face as she stoops down to kiss her child; and it is reflected in that of her daughter. But the pain of the former is mental, and that of the latter is physical.

'I felt rather uneasy in bed, mamma, so exchanged it for the couch; and when Lucy came, she moved it to the window.'

'But, my poor child, what did you do with yourself till she called you? Why did you not pull the string for me?' She pointed to a little cord that passed under the two doors, and formed a communication between her daughter's bed and her own.

'Oh, it was too early to wake you, mamma; and yet it was broad daylight, so that I could do my lace-work.—There was a letter from papa, Lucy said.'

'Yes, dear. He will be here to-day, he hopes, in time for dinner; he wrote but a short note, yet sent an especial message to yourself. He is bringing back a little present for you;' and she gave Jenny the message about the fern.

'How good of him it was,' said the invalid, flashing up, 'to think of me, when he was canvassing! Was it not, mamma?'

'I believe your papa thinks of you at all times, Jenny. I hope you will have a good report to give of yourself to him, in spite of this bad night.'

'Oh, the night was not bad, mamma; only a little long; and as for me, Dr Curzon says I am pounds better than I was when I last came to Riverside. He told me last night at the charades, that he hoped to see me act a milk-maid carrying pails next year, as naturally as Kitty did the house-maid with her broom. How charming she looked, did she not? And so did Polly, for that matter; only I thought that Polly was a trifle too natural—looked the character to too great perfection.'

'Most girls in cotton prints and flyaway caps with red ribbons, would look the part that they were playing, my dear,' said Mrs Dalton quickly.

'Yes, but our Kitty did not. It was easy enough, as Mr Holt whispered to me, to see who was the princess in disguise. That was a pretty little compliment, no doubt, and had truth besides to recommend it. But do you know, mamma'—here Jenny began to sketch most vigorously—'I don't much like that Mr Holt.'

'Why not, my dear? He seems a very inoffensive person.'

'Yes; he does not bite one, certainly; indeed, the creature makes up to us as though he had very good intentions indeed.'

'The creature, my dear!'

'Well, I should have said the man, I suppose. But even you mamma, whose good word is worth so little, as Mrs Campden says, because everybody has it, even you could not call Mr Holt a "gentleman." If you except his hat and his boots—which I own are very brilliant—he can scarcely be said to "shine in society."'

'As to shining, everybody is not expected to do that, my dear Jenny. But since your papa thinks him good enough to keep company with *him*, Mr Holt is good enough, I suppose, for most societies,' answered Mrs Dalton drily.

'Well, papa can make friends with everybody, mamma. He is equally at home with a bishop and a bargee.'

'My dear Jenny'—

'Nay, mother; I was only referring to the versatility of papa's genius. Now, we are not all of us so talented in that respect; and I, for my part, do not feel at ease in Mr Richard Holt's company. It is ungrateful of me, I know, because he evidently intends to be extraordinarily civil.'

'It is not only ungrateful, but unjust, Jenny; it is plain to me that you are entertaining an unfounded prejudice against this person.'

'A prejudice, certainly; but whether unfounded or not, remains to be proved. Lookers-on, dear mamma, it is said, see most of the game; and at the game of life, I, on my couch here, am fated to be but a looker-on. I am carried down-stairs, and set down among the rest; but no one takes notice of me—of course, I don't mean *you*, dear,' added she quickly, in answer to her mother's glance of tender reproof; 'nor any one that is dear to you; but I am referring to strangers generally. Then I amuse myself with making my little observations—"the child amongst us takin' notes," as papa calls me.'

'Your papa spoils you, Jenny, and makes you think too much of yourself, I fear. How is it possible that a girl of your years, and with so small an experience of life'—

'Less than even that of most girls,' put in Jenny quietly, 'by reason of my infirmity; I acknowledge all that.'

'Well, then, how is it possible, my dear, that you can judge rightly of grown-up people?'

'It is instinct, I suppose, or intuition; but papa says I have got it.'

Jenny has at all events some sagacity, thus to invoke her father's authority in corroboration of her pretensions. Mrs Dalton suddenly dropped her tone of reproof, and answered, laughingly: 'My dear Jenny, you are a shocking egotist; and it is useless to reason with such self-conceit. But since you have already passed this infallible judgment of yours upon poor Mr Holt, may I ask you what it is?'

'But, mamma, you won't be angry?'

'Angry, no; except with myself, perhaps, for putting such a foolish question to a child like you.'

'Well, it is my opinion that Mr Holt is, a II—U—M—B—U—G.'

'But why, Jenny?'

'Nay; I cannot say why. An oracle gives its answer, but never its reasons; indeed, I could not give mine if I tried. I have seen a hundred things in the man—of course, but little things—yet all pointing the same way. Mr Holt is acting

a part, as much as Kitty was acting one last night ; he has something in view, from which he would divert the attention of others. But there'—and Jenny laughed a merry laugh, which had a certain goblin ring about it too—'I will say no more, except that he is a humbug.'

'Considering that Mr Holt is especially esteemed in the City for his shrewd and straightforward character, Jenny,' replied Mrs Dalton gravely, 'I think you have said quite enough to upset your pretensions as a seer.'

'That is suspicious, though,' said Jenny slyly.

'What is?'

'Why, his being so "esteemed for, &c." How could he be all that, and in the City too, unless he was a humbug?'

'I don't understand you, Jenny. You might just as well say that, because your dear papa is so admired and beloved by almost everybody, he is a—that very vulgar word you said just now.'

'Oh, papa is like nobody else in the world, and is not to be judged by ordinary rules,' replied Jenny naively. 'It is his mission to make things pleasant; whereas it is not Mr Holt's mission by any means, and his endeavours to do so are most ridiculous. His attempts at a joke are like the gamboling of that horse on his back yonder, all hoof and teeth in the field; they are only laughable because they are so clumsy.'

'But everybody can't be lively and agreeable, like your papa.'

'Then don't let them try,' answered Jenny, with irritation; 'and, above all things, don't let them try to be insinuating, and soft and tender, when they are obviously rhinoceroses and hippopotamuses, and cannot do it without blowing into one's ear. Don't let them!'

Here she was interrupted by a soft drumming noise at the door, which gradually rose and swelled in volume, till it became an excellent imitation of a gong.

'Come in,' said Jenny, laughing; 'come in, you naughty boy.'

Then the door opened, and disclosed a youth of about nine years old, with a thin but merry face, set in a thicket of brown curls, and above the curls a parcel of school-books, which he held there by one hand, as a maiden holds her pitcher at the well.

He closed the door softly, then took a noiseless run and slide upon the carpet that landed him at the feet of the coach. 'And how is my pretty mamma?' inquired he, as he kissed her cheek. And, 'How is my venerable coach?' added he, addressing Jenny.

'Well, the coach is a little out of repair, Tony, this morning,' answered the young girl; 'and I doubt whether it will be able to carry all those passengers: *Cornelius Nepos, Virgil, Caesar, and the wicked Colenso*'—

'There was an old Bishop of Natal
Who had a Zulu for a pal,'

quoted the boy gaily.

'Said the Zulu, "Look here!"'—

'Be quiet, Tony; I won't have you say such things,' said Jenny sharply; 'it is all very well for grown-up people, but not for children.'

'But Jeff is not grown up—at least so everybody says, except himself—and he sings:

There was an old Bishop of Natal
Whose views upon Moses were fatal.'

'Hush!' said Jenny, holding her finger up rebukefully, and pointing to Mrs Dalton, who was looking out of the window, apparently absorbed in thought.

Pupil and teacher were very like to one another; the former had all the hues of health, but they were delicate hues, and the expression of his thin features was feminine, though intelligent in a high degree. His eyes, too, though large and lustrous, were very soft, and as his curling hair mingled with his sister's caressingly, the two might almost have been taken for sisters.

'What is troubling dear mamma?' whispered he gently.

'Hush! Nothing. But you will trouble her if you sing songs like that. Why have you brought all those books with you this morning, instead of your lesson?'

'Well, I want to get all my lessons over at once. I got up this morning on purpose to learn them; for there are to be sports at Bleabarrow to-day, Jeff says.—wrestling, and leaping, and all sorts, and Jeff is going to take me.'

'Geoffrey would make you as idle as himself, if that were possible,' said Jenny, her wan fingers playing with her brother's hair; 'but I don't fancy you will be trusted to go with him to any such place.—What do you think, mamma, of Tony's going to Bleabarrow Feast under the wing of Master Geoffrey?'

'Indeed, my child, I don't think that will quite do,' said his mother, thus appealed to. 'Mrs Campden has, I know, a bad opinion of such gatherings, and Jeff is but a boy. I am afraid you must give them up, Tony, unless the sports can wait till after papa comes home. I have got a letter which says we may expect him to-night. Is not that good news?'

'Yes, of course,' said Tony, hanging his head down a little. 'But couldn't Mrs Campden send Robert with me?'

'No, darling; a servant would, under the circumstances, be worse than nobody. A child should have some grown-up person, who is a gentleman, with him, when he goes to such places.'

'Then I've got leave to go,' cried Tony exultingly; 'for a grown-up gentleman has promised to go with me, though I would rather have gone with Jeff and Robert, if I could.'

'You don't mean to say you have inveigled good Mr Campden?' cried Mrs Dalton, not, perhaps, displeased at this proof of her little son's powers of persuasion.

'It's not Mr Campden, mamma—it's Mr Holt. He heard Jeff say that he doubted whether Mrs Campden would like me to go with him, and offered to take me himself.'

Mother and daughter exchanged a rapid glance of astonishment, and Jenny broke into one of her musical but mocking laughs.

'Mr Holt in charge of a small boy at Bleabarrow Feast!' cried she. 'That will be a more amusing spectacle than any the sports will have to offer.'

'I think it was very good-natured of Mr Holt,' observed Mrs Dalton gravely, 'and very unselfish;

for, as you say, it is quite out of his line, and he has nothing to gain by it.'

'I don't remember that I said that, mamma,' observed Jenny drily.—'Well, if you are going to these sports, Anthony, we must get on with our lessons.' And pupil and teacher commenced their usual task accordingly.

CLIMBING PLANTS.

SOME plants, as is well known, climb on others. Parasitically, they must cling for existence to trees or other adjoining supports, in which respect they remind us of certain classes of human beings, who possess no quality of self-reliance, and would sink, and perhaps perish, unless they had some one to cling to.

The subject has lately been investigated by Mr Darwin, the result being a small but interesting work, entitled *The Movements and Habits of Climbing Plants*. According to this learned authority, there are two great classes of climbing plants—those which twine spirally round a support, unaided by any other movement; and those which are endowed with irritable organs which grasp the object which they touch—such as happens in the case of Leaf-climbers and Tendril-bearers. There are, however, various subordinate divisions, possessing very curious attributes. Some twining plants move from right to left, while others take the opposite direction. So far as observation has gone, the greatest number of plants take the latter direction—that is, as Darwin puts it, opposed to the course of the sun; for in judging of the direction, he regards the plant as being in front of the individual; but we think it would have been better had he added, when the back of the individual was towards the sun.

The hop offers a familiar instance of the determination with which a twining plant spirally ascends a pole stuck in the ground for its support, and does not stop till it reaches the top, and has nothing more to cling to. Light and heat, as may be supposed, exercise a powerful influence in communicating energy to the ascending process. In our country, most of the climbers die down to the roots after flowering; the object of their growth is over, and they recommence in spring. Another interesting point is the thickness of the supports of twining plants. In the warmer regions of South America, climbing plants are seen to twine round trees five or six feet thick, and have the power of ascending to the summit, which may be a hundred feet from the ground. Obviously in such cases, and in many others, the impulsive desire is to get to the light. We have no such grand cases as these, still there is something to shew worthy of notice. The finest thing of the kind we can point out is the honeysuckle. In a piece of pleasure-ground with which we are acquainted, there are specimens of honeysuckles twining round and getting to the top of trees thirty to forty feet high, not merely keeping to a single stem, but wandering along the branches, and finally drooping down as a splendid drape.

A consideration of the fact just mentioned is eminently suggestive of what may be done in imparting beauty to fancy shrubberies. An ordinary tree, shewing nothing but green leaves in summer, may be made to exhibit rich and beautiful blossoms, as if they were part of the plant from which they

depend. Other effects of this kind may be produced. We can hardly imagine anything prettier than a small pine tree twisted round with the bluish-purple flowering vetch (*Vicia Cracca*), which winds and winds till it gets to the very apex, all the way throwing out its delicate blossoms to the sun. Superadded beauty is to be secured, even where there is no actual twisting. We have seen a remarkable instance of this in the case of a thick bushy yew and a dog-rose. The small rose-bush nestling about the root of the yew, sends out branches which straggle upwards till they get to the light outside, and then the yew is seen to be picturesquely shining with roses. These are points, we think, worth the consideration of gardeners who have charge of pleasure-grounds. From our own experience, in none of the cases just specified was any injury done to the trees yielding the support.

Darwin goes largely into the botanical qualities of climbing plants—what parts of them climb, how they ascend, and so on. He regards one of the species of *Bignonia* as one of the most efficient climbers. We have carefully watched the mode of ascent of a species of *M'Fadyena*, one of the *Bignoniaceae*, which has the closest resemblance to *Bignonia unguis*, and can certify to the accuracy of Darwin's description. The *M'Fadyena* presented a most pleasing object, with the three toes firmly grasping with their claws the bricks of the wall of a hothouse, with the two outspread leaflets immediately behind them. The firmness of the hold was very considerable; and our fingers can testify to the sharpness of the terminal claws, and to their admirable adaptation to lay hold of any object which may come in their way. As regards *Bignonia unguis*, Darwin relates a curious fact, which is, that if the tendril should fail in clasping an object, it bends slowly downwards, and its power of clasping is lost; and very soon afterwards, as if conscious of its inability now to render any service to the plant, it disarticulates itself like an autumnal leaf, and falls. He adds that he had never seen this process of disarticulation in any other tendrils; for, when they failed in clasping anything, they soon withered away. *Bignonia speciosa* is next passed in review. Its tendrils, when comparatively young, exhibit an indifference to the value of stick-clasping, for, after seizing one, they sometimes let it free (a peculiarity which was also manifested by *B. caprolata*, even to the extent of three or four times); but when older, this fickleness seemed to leave them, and they then more steadily discharged their duties. The tendril ends in a sharp, straight, colourless point, which displays a special inquisitiveness in searching out little dark holes, and thrusting itself into them; but here also its early unsteadiness again manifests itself; for Darwin declares that in one instance he saw a tendril keep its point in a hole for twenty or thirty hours, and then withdraw it. But while the one tendril may be apparently wasting its time in gratifying an idle curiosity, the other tendril may be diligently engaged in its proper work; but in the case of both, whether occupied in clasping a stick, or in inserting its point into a hole, the phenomenon of spiral contraction is equally manifest. Now, as this contraction is not exhibited when nothing is caught, we must hesitate before charging our curious friend with a dereliction of duty; for we shall see, that in *J.*

capreolata, the apparent capriciousness manifested by it was really owing to the plant not having had supplied to it a surface fitted for the peculiar development of its tendrils.

When Darwin placed a much-fissured post near the *B. capreolata*, the points of tendrils and the tips of immature tendrils crept into the most minute crevices, and in two or three days afterwards, the final process of development commenced; for the comparatively dark and closely applied surfaces supplied the very condition for which, in their natural state, they were adapted. Darwin next bound flax, moss, and wool loosely round sticks, and placed them near tendrils. 'The hooked points soon caught hold of the fibres . . . and now there was no recoiling.' The hooks penetrated the fibrous mass, and curled inwards, and each hook caught one or more fibres. These hooks now began to swell, and after a few days, were 'converted into whitish irregular balls, rather above the one-twentieth of an inch in diameter, formed of coarse cellular tissue.' By the surface of these balls a viscid resinous matter is secreted, to which the fibres adhere; and as the ball grows, fresh fibres are attached, so that our author has seen 'a little ball with between fifty or sixty fibres of flax crossing at various angles. After the development of the disks, the tendrils become spirally contracted, and tough and woody. Now, what are the conditions in the natural habitat of this plant? Professor Asa Gray informed Mr Darwin that the forest trees where this *Bignonia* grows are covered with *Polypodium incanum*, a species of fern.

Under *Ampelopsis hedracea* the description and figures of the tendrils of the plant are admirable. Often have we studied allied species, *A. tricuspidata* and *A. Veitchii*, whose sucker-like pointed tendrils, when fixed against a wall, especially when the branches of these are spirally contracted, present an object of no ordinary attraction. The closeness with which the stems are held to the wall, and the strong resistance which they offer to any attempt to remove them, shew how admirably adapted are the provisions for accomplishing the end in view. The disks consist of enlarged cells, with smooth projecting hemispherical surfaces, coloured red, and at first gorged with fluid, but ultimately becoming woody. Darwin proved by the solvent used that they must secrete a resinous substance which would aid the cellular outgrowth (which insinuates itself into every crevice) in securely fixing the plant to its support. In proof of the tenacity of the branchlets of the tendrils, Darwin mentions an old one which was able to support a weight of two pounds; and he reckons that the whole tendril would have resisted a strain of ten pounds. We suspect, however, that the age in this case must have contributed largely to the result, for on selecting the terminal portion of a branch of *Ampelopsis tricuspidata* (which had, however, been growing on a wall for only two months), which was fixed firmly by three tendrils, and attaching a weight of four pounds to the lowest of the tendrils, the portion of the branch and its tendrils were pulled from the wall; and on examination it was found that the tendril nearest the end of the branch had one of its seven disks pulled away, while the other six were left sticking to the wall; the next tendril had left its six disks adhering to the stone; while the remaining one, which was entirely attached to

lime, had six disks pulled off, and one left on the lime. If we could draw a conclusion from this observation, it would be, that the disks, when attached to an unyielding surface, are quite able at an early period to resist a heavy pull, but that the other portions of the structure of the tendril require a much longer period for attaining that woody firmness and toughness which in the case of Darwin's species exhibited such remarkable tenacity.

Of the Passion-flowers (*Passifloraceæ*) we shall only instance *Passiflora gracilis*, which (with the exception of *P. acerifolia*) is perhaps the chief of all climbers, being more rapid in the revolutions of its internodes, and more sensitive in its tendrils. Sometimes, as our author remarks, in less than an hour a revolution would be effected, and the movement of the tendrils was as rapid. The sensitiveness of a full-grown tendril is such, that one-thirty-second of a grain weight has been thrice observed to cause it to curve, and even one-fiftieth of a grain was seen to affect it. The bending commences in half a minute after rubbing the tips of the tendrils. The exquisite delicacy and regularity of the spirals in some of the species attached to a roof, especially when drawn down to some extent by the weight of the stem, are subjects of no ordinary interest.

Under Root-climbers, Darwin's remarks on *Ficus repens*, and on the caoutchouc-like material by which its roots adhere to a wall, are deeply interesting; and we think that a similar explanation must be given of the mode in which the long aerial rootlets of *Pothos Nymphaeafolia* are fixed, as it seems otherwise impossible for them to adhere to flat surfaces, as we know they do with efficiency; and it would account for the fact, that after they have been torn off they do not seem, so far as we have noticed, to be able to adhere anew.

We fear that our necessarily brief and imperfect sketch may have failed to give our readers a just idea of the deeply interesting details with which Darwin's new work abounds; but we trust enough has been said regarding the curious and wonderful properties of this class of plants, to excite in each reader a strong desire to peruse the book for himself, and if opportunity be afforded, to make his own observations.

THE LIGHTHOUSE OF THE GANNETS.

IN FOUR CHAPTERS. CHAP. I.—TO THE RESCUE.

'KEEP her away, you at the helm! Keep her away! d'ye hear? Pull, lads, just a couple more strokes, to clear the pier-head, as the current catches our bows, and then bear a hand with the sail. There's hardly air enough stirring to flutter a lady's veil in-shore here, but I see broken water in the offing, and what little wind there is sets right for the Gannets.'

The speaker was a hale old mariner, whose pin-nace, the *Delight*, was being rowed out of the tiny harbour of Ravenscombe, in the extreme south-west of England, on a brilliant summer's morning, when sea and sky were alike decked out in the gayest tints of blue and gold, and when the balmy breeze was zephyr-like in the softness of its touch. The pretty watering-place, with its trim crescents and terraces, and the white villas above it, each

nestling amidst myrtle bushes and fuchsia-beds, and banks carpeted with trailing roses, looked at its best; and even the gigantic cliffs of the Cornish coast seemed to wear a smile, as though the loveliness of the weather had possessed the power to charm away the ruggedness of the grim, bare rocks, the base of which was bathed by the surges of the now sleeping Atlantic. On the quaint gray pier of rough-hewn stone sundry groups of idlers had gathered to watch the departure of the pleasure-boat, and parasols and handkerchiefs were waved in sportive token of adieu to those on board the *Delight*, by friends on shore.

Mingling with none of these groups of gazers, but nevertheless intently observing the receding pinnacle, was a young man, whose handsome face, slightly bronzed by exposure to a fiercer sun than that of Britain, wore an expression sad and dejected enough, as his eyes wistfully followed the little vessel starting on her holiday trip. In addition to the *Delight's* crew of four sailors, she had on board four passengers, two of whom were ladies, mother and daughter evidently, the latter being a beautiful girl, who seemed to derive but little pleasure from the prospect of the excursion, and from whom the gentleman who sat nearest to her vainly strove to win a smile or a glance of approval.

'Don't you know them?' said a voice from among the nearest knot of lookers-on. 'Those are Mr and Mrs Lee, of Brooklands, half a mile out of town, and their daughter; and that is Mr Damer, of Damer Park, who was M.P. for Camelford, a tremendously rich man. I hear that he and that pretty Miss Lee are likely to make a match of it.'

Lieutenant Gordon, R.N.—the name of the young man who stood silently on the pier-head, watching the boat as it was pulled out of harbour—could not forbear wincing as these carelessly uttered words reached his ears, albeit he was only too well aware that they were substantially true. Malcolm Gordon was beginning to wish that he had never seen Ravenscombe at all. It was but a few pleasant weeks since he had come thither with his friend Jack Lawless, whose fine schooner-yacht, the *Titania*, lay at anchor near the quay, with her white sails gracefully brailled up. He had learned to love Rosa Lee, and had won her love, although his proposals had been, but two days since, politely but coldly declined by Rosa's parents, who were bent on seeing her established in life as Mrs Damer, of Damer Park. Even with the smart of his recent disappointment rankling in his mind, Malcolm could not but own to himself that Mr Lee's preference of a wealthy son-in-law was scarcely to be wondered at.

The young naval lieutenant had nothing but his pay, and was leading, as many good officers perforce do, a life of idleness on shore, for lack of the interest to secure employment. 'If my elder brother, Archie, had been the suitor in my stead,' such was Malcolm's soliloquy, 'perhaps he might have met with a more patient hearing.' And as he spoke thus, memories of the green oak glades and dark fir-woods of Glendarroch; of the grim, half-castellated house that had so long sheltered his Highland ancestors; of

the old laird his father, and of his only brother Archibald, who cared for little but the sporting over the wild moors, of which he was heir of entail, rose up before him; and he was only recalled from his reverie by the sound of a cheery voice, which exclaimed close by: 'Why, Gordon, old fellow, are you dreaming in broad daylight, that you ignore your best friends in this unconscionable fashion! I have been looking for you high and low.'

It was Jack Lawless who spoke, laying his ungloved hand, as he uttered the words, on his friend's shoulder. A blithe, kind-hearted, utterly useless member of society was Jack, merely one of the gilded youth of the age, of no special calling. But, nevertheless, Jack was a favourable specimen of his kind, and his frank face and ringing laugh won him friends everywhere. He had a genuine regard for Malcolm Gordon.

'They will have a pleasant sail of it to-day,' said the owner of the *Titania*, as he drew from the breast-pocket of his blue yachtman's jacket a cigar-case, the weedy contents of which he offered to his friend. 'I saw Damer for a minute as he got down from his tandem, and he told me that he had chartered old Mawle's boat there, and intended to play the part of a regular cicero to the Lees, and shew them all the lions of the coast. They're new people here, you remember, whereas Damer is a Cornishman born and bred. So they are off to the lighthouse on the Gannets, first of all; and then to Tregony Cove; and after picnicking there, they visit the Nnn's Stair, and Penludra, and the Logan Stone, and'—

'The Gannets! you don't mean that she—they—that there can be any intention of visiting the lighthouse on the Gannets, to-day!' interrupted the young officer, with a nervous anxiety, inexplicable to his mercurial friend, who arched his eyebrows as he rejoined:

'Why not? If they had consulted the almanac on every morning of the three hundred and sixty-five days in the year, I don't suppose they would have chosen a better day here, on this stormy Cornish coast, where we come in for the full strength of the Atlantic rollers. They are well out of the lee of the land now, and bowling along merrily. I really envy them the excursion. The essential thing for us idlers is to know what comes next; a game at billiards, or'—

'It's eleven miles to the Gannets; two hours good, at the rate of sailing of that boat,' muttered Gordon, heedless of his friend's suggestion; 'while to get back would occupy three, even without that visit to Tregony Cove. I don't like it.' And he threw another quick, searching glance at the horizon, where, on the verge of the gold-flecked sky, there floated a few streaks of filmy cloud, lying packed to windward.

'Come, come, don't play the part of Cassandra!' said Lawless incredulously; 'you are a sailor, and I a poor landman, but second-sight alone could excuse such croakings. Why, I passed just now within earshot of a cluster of old salts, among whom Dawson, my sailing-master, was prominent, and their verdict was unanimous in favour of the day's being an exceptionally fine one. Besides, Mawle, the skipper of the *Delight*, is a tough old sea-dog, who would not venture beyond the length of his tether, with ladies on board.'

'These Cornish coasting sailors are bold men enough,' answered Malcolm, shaking his head; 'but they have too much foul weather ready-made to hand to be as ready to read the signs of a squall, white or black, as we who have learned our textbook in the hurricane latitudes. But no man is infallible about storms. Come, we will play billiards, if you like. Come across, then, to Henshaw's Rooms, and let us while away the time over the rolling ivory.'

But after knocking the balls about for half an hour, Gordon grew restless, and laid aside his cue. 'It's of no use, Jack; I can't make a stroke to-day,' he said. 'If you like, we'll stroll about the place, though in good earnest I am sick of Ravenscombe. When, I wonder, can we up anchor and be off?'

'When you like, old boy,' said easy-going Jack, who had by this time gained an inkling of the fact, that his friend was seriously in love with Rosa, and that his courtship had not prospered—'when you like. By Jove!' he added, as they sallied out into the street, 'I begin to think you were a true prophet, and that the weather is not quite such a case of set fair as it seemed to be.'

And indeed, already had the beauty of the day departed, while a hazy film hung athwart the lately brilliant azure of the sky, and the wind, feeble as yet, blew in fitful gusts, that whirled aloft the dust and dried wrack-weed of the sandy beach.

'They'll put back, of course, in the *Delight*, when they see the queer look of things,' said Lawless, half carelessly taking out his telescope, and adjusting it so as to sweep the sea in the direction of the Gannets.

'That's just what they won't do, unless I am greatly mistaken,' answered Malcolm, compressing his lips: 'that old Mawle is as obstinate as a mule; and unless they go about pretty early, they would not find it easy to make the harbour with the breeze fast freshening to a gale. Let me see if I can get a glimpse of them through the glass.—Thanks. No; I see nothing but sea-mews' wings and foaming wave-crests. I hope Mawle may have the sense to run for Studley, or for St Kevin's, before the sea grows rougher.'

By this time it was clear, from the conversation and gestures of the fishermen and other blue-jackets on the quay, that their recent confidence in the settled serenity of the weather had been disturbed.

'We'll have half a gale,' observed one white-haired Nestor in a striped nightcap and elephantine sea-boots, as the young men went by.

'Ay; and the other half to the back of that,' answered Gordon sharply; and then said, earnestly: 'I say, Lawless, I'd take it very kind of you if you would order your people to get the yacht ready for sea, and let us stand out, and overhaul that pleasure-boat, before worse comes of it. The *Titania* will have a tossing, but it won't hurt her.'

'But it *would* hurt me,' rejoined the owner of the vessel in question. 'This child only fancies the ocean when it is in good-humour, thank you, and has not the least taste for mountain billows and their concomitant of sea-sickness. But come, my dear fellow,' he added, glancing at Malcolm's anxious face, 'I'll lend you the craft, crew, skipper, and all; but I prefer keeping my feet

on *terra firma*, and my appetite for dinner unimpaired. Luckily, here is Dawson. You two nautical authorities may settle the matter between you.'

The sailing-master, although now fully convinced that 'dirty weather' was brewing, was not unwilling to put out to sea, or to place himself under the orders of the young naval lieutenant, whom he knew by experience and repute to be a first-rate seaman. But it took some time to get all the hands mustered on board, and as the schooner stood out of harbour, the canvas flapped ominously, and the first low muttering of thunder made itself audible.

'They'll have to take in sail afore long, or the wind'll spare them the trouble,' remarked a sailor on the pier, as he watched the *Titania's* progress; and indeed the weather was rapidly changing for the worse. Crash upon crash, peal upon peal, rung out the deep diapason of the thunder, while flash after flash of lurid lightning illumined the fast deepening gloom; and amid sheets of driving rain and clouds of blinding spray the schooner was seen staggering along, sorely buffeted by the first fury of the storm, but bravely beating up towards the distant lighthouse on the Gannets. Jack Lawless, as he turned up the collar of his pea-jacket, began to entertain considerable apprehensions for the safety of his fine yacht, but the remembrance of his friend's danger turned his thoughts into another channel. 'I'd give, yes, I *would* give the *Titania*, hull, masts, and cabin fittings, to see Malcolm safe and sound ashore again,' muttered the soft-hearted young fellow, as he lost sight of the tempest-beaten vessel, now sturdily working her way out to sea.

CHAPTER II.—DANGER.

'Are we not fortunate in our day? Look, Rosa, love, how prettily Brooklands seems to smile down upon us from the hillside yonder, and how wonderfully near and distinct everything looks! This must be quite a treat in Cornwall, if Mr Damer will forgive my saying so much of the climate of his native county,' said Mrs Lee, as the *Delight* glided smoothly out of harbour, prattling, as well-meaning women often do, in utter unconsciousness of coming mischief.

'I remember to have heard the Cumberland shepherds say,' rejoined her husband, 'that these excessively fine days, when distant objects seemed, as they now seem, to be brought so very near, and when every outline was sharply and clearly picked out, were not to be trusted. If so, this would be a good test for their theory.'

'Cornishman as I am, I do not make the least pretence to weather-wisdom,' said Mr Damer, smiling. 'My simple philosophy teaches me, however, to enjoy a good thing when I have got it, and I hardly think that a more enjoyable morning could be welcomed anywhere. Why, the sky is blue enough, and the sea rich enough in colour, for this to be Italy instead of Cornwall; and if we are lucky enough to be passing the ruins of Penluddra Castle when the moon is up, you will see a sight, Miss Lee, not easily to be matched, for beauty, anywhere.'

Rosa bent her head, and uttered some commonplace reply; she was not in a mood to be readily interested in anything that Mr Damer might choose

to say; and, indeed, as time progressed, Mrs Lee saw with regret that the attentions of the county magnate were to all appearance wholly thrown away upon her daughter, and secretly deplored the discrepancy between Rosa's views and her own. She had with feminine tact planned this expedition for the express purpose of throwing Mr Damer and Miss Lee into the society of one another, but, as it seemed, unsuccessfully, as regarded the weaning of Rosa's heart from its first attachment.

The earlier part of the voyage was pleasant and prosperous enough, but presently the motion of the boat increased perceptibly, the sunny splendour of the hitherto unclouded sky seemed to fade and darken, and it was evident by the bustle among the boatmen, and their frequently consulting together in an undertone, that some change of weather, hitherto unlooked for, was coming on. First one reef, and then another, reduced the spread of sail, and ballast was adjusted, and sheets made handy, while old Mawle himself took the *Delight's* tiller in his horny hand, as the large boat bounded merrily over the surge.

'I could almost wish,' observed Mr Damer at length, 'that we had deferred our trip to the Gannets till another occasion; and yet I much wanted the ladies to see one of the wildest bits of thoroughly maritime scenery off our coast here. The sea, however, is becoming somewhat more boisterous than it should be for so long an excursion. I am not sure, Mr Lee, but it would be better to forego part of our pleasure-trip, and have the boat's head turned towards Tregony Cove, where we are to dine.'

'You can't, squire, begging your pardon,' said the bluff old owner of the *Delight*. 'It would be a tempting of Providence to run for Tregony now, and if we were off the mouth of the cave, you'd not be able to land, without wings, you wouldn't, through the surf that's on by this.'

'Perhaps, then, it would be better to return,' said Mr Lee, growing pale. 'The sea is becoming very rough, and the sky looks threatening.'

Old Mawle shook his gray head.

'We couldn't put back to Ravenscombe, sir,' he answered, as under his skillful guidance the boat rode buoyantly over the huge glossy waves, 'not if our lives depended on it. We might make Studley, but we'd maybe get swamped in crossing the harbour bar, in such a sea as will be breaking on it. Our safest plan, my mates and me thinks, is to stand out for the Gannets, if the wind holds.'

Mrs Lee uttered a kind of shriek, while Rosa could not repress an exclamation of alarm.

'The Gannets, surely not!' exclaimed the former of the two; 'we shall never reach the lighthouse alive. It seems sheer madness to traverse miles and miles of raging sea in a cockleshell of an open boat, and so near to the shore as we still are.—Offer them money, Walter,' she added to her husband; 'twenty pounds—fifty pounds, to land us safely somewhere on the coast.'

There was a rugged dignity in the old boatman's bearing, as he made answer: 'Madam, if you could promise me to load the pinnacle gunwale-deep with golden sovereigns, I couldn't earn them—if you'll trust the word of a seafaring man of my age—by setting you ashore, dry and safe, from this to the Scilly Isles, except the one place I spoke of, where we'll be, I reckon, in three-quarters of

an hour. Bribes go for nought here. If I can't save my passengers for my just pay of thirty-six shillings, I can't do it for the wealth of the Indies. Squire Damer knows me, anyhow.'

'I really think,' said Mr Damer, leaning forward and speaking hurriedly and earnestly, 'that we had all of us better be guided by the advice of Mawle here, backed as it is by the opinion of the other sailors. At the lighthouse we can take shelter until the storm abates, and'—

The remainder of the sentence was lost amidst the deep reverberations of the sullen thunder that now rolled overhead, and it was by a silent gesture that the tough old helmsman received the assent to his proposal. A minute later, and, under a mere rag of sail, that strained and tore at the bending mast and the restraining cordage, the *Delight* was flying like an arrow through the savage sea, receiving blows that made her quiver from stem to stern, and seeming at each instant to be in danger of being swamped by some one of the many breaking waves that reared their foam-crested heads high above her, while far and wide the froth-bells flew, like snow-flakes in winter before the shrieking wind. Once and again, too, some enormous billow would come rolling towards the pinnacle, and Rosa, as she sat with blanched face and dilated eyes, would watch the oncoming of the mountain wave, and anticipate the disaster that seemed so imminent, until a dexterous movement of the helm evaded the peril.

No steering, however skillful, could quite keep an open boat dry in such weather, and in spite of all that could be done to shield the ladies, the drenching spray flew ever and anon over the gunwale of the *Delight*, and first one man, and then another, had to work hard at baling. Then there rose through the misty atmosphere, phantom-like, a gaunt white wooden tower, perched upon a hog-backed, sharp-edged rock, over which the sea broke furiously, and which was, on the seaward side, environed by a roughly traced semicircle of smaller rocks, some of which were so low in the water as to resemble thin black lines of ragged stone, lashed by waves.

'This be the Great Gannet; yon's the Brood,' said Mawle gruffly, as he pointed to the lighthouse. 'Steady, now, my lads, to down sail and chuck the grapnel, as I run her in for the landing-place. Save life and limb, if the boat must go to pieces.'

Then came a dreadful moment of feverish expectation. A crash of breaking planks, a shouting, and trampling, and clutching at every point of vantage, and neither Rosa nor Mrs Lee, nor even the gentlemen of the party, ever quite realised how narrow had been their escape, as they emerged, wet, dripping, and breathless, from the clouds of flying spray, and began one by one to ascend the copper ladder that formed the only means of access to the lighthouse. But all crew and passengers, were safe ashore, though the *Delight* was immediately afterwards a mere heap of drifting wreck, tossed to and fro among the eddies between the half sunken rocks, over which the sea broke in thunder. At the head of the ladder stood a tall, melancholy-eyed man, whom, by his dress, the newcomers concluded to be the keeper of the lighthouse, while behind him came a young sailor lad, whose beardless face contrasted with the unshaven chin and strongly marked features of his senior.

'You are welcome, as what Christians would not be, to such poor accommodation as I have to offer,' said the elder man, whose garb was that of a sailor, but whose speech had a fluency unusual among mariners: 'a roof at anyrate, and a fire presently whereby to dry your wet clothes, and the government rations of rum, biscuit, and salt meat. This is not a commodious place, ladies; but I hardly thought, when, five minutes since, I saw your boat going fast to splinters against the ragged rocks below, that you would be standing here safe and sound. Lookers-on, as the saying is, see most of the game, and you've had a narrow squeeze for it. A Ravenscombe boat, or one from Studley? Why, it's Skipper Mawle, surely?'

'Yea, Mr Willis, I be,' answered the old man; 'that is, in course, if I ought to be called a skipper without ever a craft to be master of. It cost me fifteen years of hard saving before I bought the *Delight*, and now she's gone, like a broken tobacco-pipe.'

'The wreck of your boat shall be no loss to you, Mawle, in a money point of view,' said Mr Damer in a kindly tone; 'I can promise you that.'

By this time the keeper of the lighthouse had conducted his unexpected guests into a large, low-ceiled room, the white-washed walls of which were adorned by a few cheap prints, a copy of the *Nautical Almanac*, and some old brass-hilted cutlasses and telescopes hanging to rusty nails. A ladder led upwards to the loft-like upper story where the lamp was kept, and three hammocks, as on board a ship-of-war, swung in their respective corners. The lad was already busy kindling a fire in the cooking-stove, and improvised seats were provided for the ladies; but Mrs Lee, as she looked around her, could not repress a shudder.

'Will it be long, do you think, before we can be taken away from here?' she asked, addressing herself to no one especially. There was a singular gravity in the face of the man who had been addressed as Willis, as he replied: 'Who can tell? If the weather mends, and a vessel comes within hail, there's a chance; not else.'

'Have you not regular visits from the shore?' asked Mr Damer, as he placed a wooden bench near the fire for the accommodation of Miss Lee and her mother.

'Yes, we have, sir,' answered Willis moodily. 'Tuesday, if the sea allows, the boat will bring fresh provisions. Bring a new hand, too, she will, in place of the one that's missed the number of his mess three weeks ago. Poor Tom was standing on the stones below, not two yards from the ladder-foot, when a bigger wave than common washed him clear off the platform, and we were as powerless to help as new-born babes could have been. He wasn't the first that's been swept off the Gannet. Let's hope he'll be the last; but all our lives are in the Lord's hand.'

'What do you mean?' asked Mr Damer, who saw that there was a deep earnestness underlying the man's gloomy vagueness of speech.

'I mean that the lighthouse is going to pieces, and that four-and-twenty hours of storm, such as we often have here, will send us'—

'Where?' exclaimed Mrs Lee, with white lips, as Willis hesitated to conclude his speech.

'You hear it give the answer, lady, do you not?' returned the keeper of the lighthouse after a pause, during which nothing was heard but the shrieking

of the wind, and the boom of the resounding waves. 'The voice of the strong cruel sea hungering for our poor lives. If the wind does not drop, nothing earthly can save us.'

SOPHISTICATIONS.

IN a recent article (September 4, 1875, 'Notes about the Mint') we gave some particulars concerning the coinage, including extracts from the public records relating to suspected or ascertained debasement of the current coins in bygone ages. So far as suspicions of the government or the officials are concerned, we are now happily at ease; but individual rascalities are probably as rife as ever.

It is the old story—ingenuity and ability becoming mischievous through being applied to dishonest purposes. Sand in sugar; spent tea-leaves, redried and recurred to look like new; black tea coloured like green; mixtures of roasted corn and beans with coffee, and of queer odds and ends with cocoa; tobacco, gin, mustard, pepper, milk, port wine, sophisticated with substances which do not properly belong to them—all tell us that knavery is far too active in shops and manufactories.

The poor purchasers in humble neighbourhoods are not the only victims; nor are articles of necessity the only kinds to which fraudulent ingenuity is applied. The buyers of costly works in fine art have need of caution to an extent that many of them are far from suspecting. Experienced picture-buyers have become aware that pictures apparently old, and bearing the names of the great masters, are in too many instances really modern. Old panels and canvases are repainted with copies from fine pictures; the colours are purposely made dark and smoky, as if toned down by age; while the cracked surface of old varnish is imitated by placing the newly painted picture for a time in a heated oven. Old china and earthenware are selling at prices perfectly monstrous, as we have had occasion already to shew (April 17, 1875, 'The Old-china Mania'); and this has set unscrupulous men to produce modern-antiques, new products of the potter's wheel and the potter's mould, coloured and decorated in exact imitation of much-prized productions of past centuries.

Bank-notes, in bygone years, used to be largely forged; but many country notes and foreign notes are now engraved and printed by London firms, so exquisite in minute detail, and with different coloured inks so intermixed, that forgery seems well nigh hopeless. The Bank of England has made but little change in the appearance of its note, relying on clues and tests which are known to few persons besides bankers; the paper, especially, is believed to be almost inapproachable in peculiar qualities.

Coins are perhaps the productions on which the greatest variety of sophistical arts has been exercised; so fertile has roguery been in devising ways for inducing these pieces of metal to appear to be what they are not. As we have lately shewn in the article cited above, matters were not quite right in this respect among the officers in the Mint during the time of Charles II.; but 'smashers,' 'sweaters,' and 'clippers,' it is now

known, have been busy in various countries from very early ages. The name clippers explains itself; while the sweaters reduce the substance of the coin, either by shaking many of them together in a leathern bag, or by some other means, and appropriating the surface 'sweat' obtained thereby. Smashing is not the making, but the circulating, of base coin; the word probably belongs to thieves' slang, for the name of 'smash-feeder' is given by them to a nickel silver or imitative silver spoon.

Numismatists and coin collectors have good reason to know that nefarious skill is at work in their department. A very old and scarce coin, say of silver, is worth in the antiquarian market many times its weight in that metal; and hence there is a strong temptation for the cleverly-dishonest to produce coins which can be sold for as many pounds as they cost shillings. Curiously enough, this laxity was known to the ancients as well as to ourselves; for Roman coins have occasionally been dug up, some evidently plated, some as evidently washed over with a mere surface of precious metal. At the present time, the Greek islands shelter men who make false dies of ancient coins, as a preliminary to the manufacture of new specimens so doctored up as to pass for old. The trade must, indeed, be a lucrative one, if the statement is correct that one engraver of these false dies netted two or three thousand pounds from the pockets of Englishmen alone, who innocently purchased the counterfeit at high prices, under a belief in their genuine character. Old Roman coins require to be scanned closely, whenever a high price is asked for them; it is said that almost every collector has some whose genuineness he doubts, although he has not tests sufficient to settle the matter clearly. A numismatist, a few years ago, warned collectors to be on their guard concerning half-groats and pennies of Richard III.'s reign; there are but few of them in existence, and imitators have been tempted to enter this field; the fraudulent specimens are well made, and put on that worn appearance which would be due to great age.

Much could be said as to the sophistication or imitation of coins which, on account of their age or rarity, command a market price much beyond their original value; but the debasement or fraudulent imitation of the current coin has also for ages afforded a field for misapplied ingenuity. An extant official document, relating to Wells in Somersetshire, describes a curious way of determining the legality and excellence of a current coin. In the time of Queen Elizabeth there was a coin called a *teston*, of which there were two varieties, one worth just double the other. The four-penny *teston* and the twopenny *teston* were current at the same time, and being of the same size, though different in alloy, were frequently mistaken for each other. The document to which we allude is an Order in Council addressed to the Corporation of Wells in 1559. Four discreet, honest, and competent persons were to take their station in the market-place, and act as money-inspectors. By whom they were to be accompanied, and in what way to proceed, we will describe in the quaint language of the original. The corporation were directed to select 'some Goldsmythe of the beste knolege yee can gette, or some other p'son havinge beste knolege in the matter of moneys, and shal ther be ready to judge and discerne of all man'r of Testons that anye oure subjectts shal

bring unto youe whiche bee of the value of two pence to be stryken wyth th' yron havynge the Greyhounde uppon the side of the Teston wher-uppon the kynges face ys, behind the hedd over the showlders, and th' other Teston of four pence yee shal stryke wyth th' other yron havinge the Portcullice before the face, and so f'wyth redelyv'r the same moneys to the same p'sons that dyd p'sent them unto you. And ye shal take good regard that yn no wyse ye doe stampe anye Teston valued at two pence with the stampe of the Portcullice.' We may here remark that *teston*, *testone*, *tester*, *testern*, and *testril* are all believed to be modifications of the same word, referring to *teste* or *tête*, the head of the sovereign stamped on the coin. The value, in England and some foreign countries, has ranged from a maximum of twelpence to a minimum of twopence.

Before the accession of the present sovereign to the throne, the English silver coins were in a multitude of cases worn so completely smooth and plain, that forgers were tempted to put into circulation smooth discs of silver or alloyed silver, the intrinsic value of which was much below the current value of the real coins. When the over-worn silver coins were called in, and sent to the Mint to be remelted, the smooth blanks were of two kinds, genuine and fraudulent. The practical officers at the Mint adopted a singular way of ascertaining whether any raised device had ever been on these blanks: they placed them on red-hot iron plates; when heated to a certain temperature, the fraudulent pieces remained as plain as before; but the worn-down genuine coins presented the device very faintly re-introduced, of a greenish hue; this revival disappeared as the coins cooled down, but lasted long enough for the immediate purpose in view. Collectors themselves adopt a similar plan, when testing old silver coins of which the device is so worn down as to render the reign and date almost illegible; they place them upon a red-hot poker, and watch till the inscription comes temporarily into view.

Macaulay gives a graphic account of the woful state of the coinage in the closing years of the seventeenth century. Down to the time of Charles II., the blanks for coins were cut out from sheets by means of shears, and then hammered into circular shape; this circularity was by no means perfect, while the edge was often irregular, and without any legend or milling. One consequence of this was that the dishonest clipped and pared and filed the edges of the coins, and appropriated the fragments of gold or silver thus obtained. The government, on urgent and repeated representations from bankers, merchants, employers of labour, and shopkeepers, caused a machine to be constructed for milling or stamping the edge. But, unwisely, the old coins and the new were allowed to be in circulation at the same time, producing an effect which had not been duly foreseen. 'Fresh wagon-loads of choice money came forth from the Mint; and still they vanished as fast as they appeared. Great masses were melted down; great masses exported; great masses hoarded; but scarcely one new piece was to be found in the till of a shop, or in the leathern bag which the farmer carried home from the cattle-fair.' The gibbet at Tyburn was at work nearly every week, executing wretched creatures, women as well as men, who had been convicted of clipping the coinage; but the profits

of the nefarious trade were so large that even the terror of the gallows did not act as a cure. One clipper was wealthy enough to offer six thousand pounds as bribe for a pardon. He was unsuccessful; but, as Macaulay remarks, 'the fame of his riches did much to counteract the effect which the spectacle of his death was designed to produce.'

The falsifications known to be practised at the present day are many in kind. Small bits of metal are punched out of good coin, and melted down till there is enough to sell to a refiner. A sovereign is split in two, some of the inner gold taken away, a thin layer of cheaper metal put in, the two halves re-soldered, and the milled edge furnished up. A well-stamped coin is made, but of gold or silver lower in value than the proper standard. A sovereign is 'sweated' or subjected to some process that will take off a little of the good gold, without materially affecting the appearance of the surface.

The above-named methods of falsification are, it is believed, not so much practised now in England as at some former periods; but the beautiful art of electro-metallurgy is, unfortunately, made to assist roguery in these matters. A case that attracted much attention in London some time back shewed how far this is carried. In a busy neighbourhood, sovereigns were tendered for purchases at numerous shops, good silver to be received as balance. The sovereigns were so undoubtedly gold, the 'ring' so sound, and the devices so perfect, that the coins were taken without suspicion. But the person who made the purchases became known to the shopkeepers; questions were asked how golden sovereigns happened to be so plentiful in such a quarter; and an assay of the coins was determined on. One of the sovereigns was found to be good gold, and of the right ring, but was one-tenth short of the proper weight. The police, furnished with a clue, obtained entrance into a squalid room containing a galvanic battery, sulphuric acid, sulphate of zinc, sulphate of copper, and cyanide of potassium—ascertained by an analytical chemist to be such; besides these, were found in the room bent wires, files, plaster of Paris, emery powder, a board with round recesses sunk in its surface, steel burnishers, small crucibles, a blow-pipe, and other articles. The facts afterwards ascertained shewed that the chief culprit was a man who had moved in better society, and possessed considerable knowledge of chemistry and electro-metallurgy. He knew how to take off two shillings-worth of sterling gold from a sovereign, without interfering with the sharpness of the device; and then to restore the lustre in the proper places by means of a steel burnisher. The victims had no other satisfaction than that of bringing the criminal to punishment. A banker would not have been deceived as the shopkeepers were; measuring and weighing would have revealed deficiencies not made manifest by ringing on a counter or testing with a touchstone.

The passing of surreptitious coin is frequently left to be managed by women. We have curious evidence that this was done so far back as two centuries ago. One Katherine Williams, in 1685, made it her practice 'to utter false Guineys at Foxhall and several other landing-places between that and Greenwich, by stopping at such places, and sending her waterman ashore to change her bad Guineys.'

A LOW SCALE OF COMMERCIAL MORALITY.

The following occurs in the *Sanitary Record* for November 21, 1874. It is a painful exposition of a state of things which it is to be hoped is in the course of removal.

'The Report of Mr Stoddard, the city analyst for Bristol, shews that rather a low scale of commercial morality exists in that town. Out of eighty-nine samples of food, &c. which he had analysed, forty-seven were adulterated. From nine samples of tea, six were mixed with a large percentage of a mixture of quartz, sand, and stalks, made into pellets with gum, faced to imitate green tea. Sugar was impure from glucose and dirt. Twelve samples of milk were extensively lowered, from fifteen to seventy per cent. having been abstracted in some cases, and in others from twenty to thirty per cent. of water added. The whisky contained so much fusel oil that it produced unpleasant symptoms whenever it was drunk. Seven samples of butter were impure from the addition of extraneous fats, water, and colouring-matter. Many specimens sold as fresh country butter were adulterated to the extent of twenty-five per cent. Nine samples of citrate of quinine and iron were largely deficient of quinine; and of three samples of milk of sulphur, two contained three-fourths of its weight of sulphate of lime. Mr Stoddard concludes his Report by saying that these facts speak for themselves, and prove the value of the Adulteration Act, if carried out with careful promptitude. A great deal of promptitude is required to check effectually this enormous amount of adulteration.'

THE SILVER WEDDING.

On the twenty-fifth anniversary of their wedding-day, it is customary for parents to receive a silver gift from each member of the family. On the fiftieth (rare event), a golden gift.

RECEIVE my offering, Mother mine,
Upon this wedding-day of thine.

Twenty years and five have shewn
A softer lustre o'er thy head,
And turned thy golden locks to gray,
On this thy Silver Wedding-day.
But all unchanged the better part;
The kindly eye, the loving heart,
Still beams as bright, and glows as warm
As on thy wedding-day of old;
And lend to all thy ways a charm
Which binds thy household in a fold
Of deepest love. No iron bands
Have half the force that love commands.

Long may they gather round thy chair,
Thy stalwart sons, thy daughter fair
(Ah! darling Polly, how we prize
An Heaven's own light those bright-net eyes,
'Sweetest eyes were ever seen'
Since Camoens sang the fair Catrine).

Long may thy gentle rule command
Each loving heart, each ready hand,
And long, long years—at least a score
Fleet lovingly as heretofore!
So take my gift, dear Mother mine,
Upon this wedding-day of thine.

FOLLIES OF FASHION.

ONE can scarcely help laughing to see a whole flock of sheep jumping at a particular spot because one does so; but is there not a similar absurdity in the way that ladies, one after the other, follow the remarkable fashions of the day? They can give no reason why they do so, further than that it is the fashion. That seems to be the only argument employed. In not one instance out of a hundred can any one tell who is the leader of fashion, or the originator of any particular costume or part of it. It may be, to-day, an illustrious invalid, to conceal some physical defect, or a Parisian draughtsman in a garret; to-morrow, the suggestion from an old print or a portrait in some collection; and the next day, one of Madame Chigot's underpaid and overworked seamstresses, who has manipulated a dress, from the sheer want of material, into a new arrangement; or, from the redundancy of stuff—too much for one, and not enough for two—has given amplitude of skirt and expansive trailing of robe, which (if it takes) becomes the reigning style for the next week or so. Then the town becomes aflame through the agency of the immensely augmented fashionable literary media; and according to the length of our purses, and too often without reference to our means, the darling element around us obey the new 'regimental orders,' adopt the regulations, and become as alike to each other in dress and accoutrements as so many soldiers in the same squad. Resistance is vain. To be out of the fashion is to be out of the world! Thus, the most absurd, and in regard to the wearer, often the most incongruous, habiliments are adopted and maintained as the correct thing, in spite of all opposition from the more sober-minded lover of taste. Nor should it be forgotten that a style of dress begets a style of demeanour. To take the sterner sex, the man who dresses 'horsey' talks horsey; and it is the same with women—the women who dress 'fast' will talk 'fast.' The character, in fact, must be kept up; Macbeth cannot perform without, at least, the vision of the dagger; nor can the mimic

monarch strut upon the stage without his robes of ermine.

It has been asserted as an excuse for many frivolities of fashion, that women seek variety in dress to render the admiration of the male sex the more secure; but every day must convince those of observation that this can scarcely be the case; as amongst men whose opinions are of any value, the most simple costume, if neat and appropriate to season and locality, is always preferred. Men, as a rule, are more shocked than otherwise with gaudy blandishments in dress; and all our poets who have touched upon the subject agree in denouncing the meretricious as gilding of refined gold or painting the lily—a wasteful and unlovely excess. The fact is, that if the truth were fairly put, this struggle on the part of women to be first to adopt any new quackery in costume, is more to vie with their own order and sex for precedence, and to exhibit the possession of the means of a prodigal display, than any desire to enhance their charms in the eyes of men—simply that they know they are safe there in any guise.

We have certainly known instances in which men have been at fault by influencing their lady connections in the choice of costume and material; they, in their mistaken solicitude for 'appearances,' urging that they wished their wives and children not to look 'dowdy' and unlike other people—that is, people with ten times their income, and a considerably higher social position. But these cases are exceptional, and, when they arise from the male side, have a tendency to cure themselves. One instance we can recall with pain of a lady being compelled by her husband to walk forth from a shop with a pair of new shoes on her feet, which, by their tightness, brought tears into her eyes; her spouse declaring, to her remonstrances, that she had a very pretty foot, and he was not going to have it spoiled. And so, it may be, the Frenchman is led to believe that the English take their pleasure sadly, from the great proportion of women to be seen at any *fête* who are suffering under torture from this cause.

We do not trespass here upon the question of the impetus which fashion gives to our manufactures, and the hosts of people it keeps in constant employment; nor do we venture to dictate to those whose fortunes are sufficient to warrant their indulgences in any eccentricity, beyond the fact, that they are responsible in some degree for the example they set in those excesses in dress, which the middle and poorer classes of late years have struggled to imitate. There is little doubt that, with a very large section of female society, dress is the one absorbing passion. We can scarce intrude into any coterie of ladies, or overhear at the corner a knot of servant-girls, without finding that this subject, tinged with a spice of scandal, plays a very considerable part in a 'kettle-drum' or stolen gossip. Nor is this example the less baneful upon children, who are now not content to dress their dolls like ladies, but they themselves must be dressed like dolls.

We can scarcely exempt any nation or sect from a tinge of this folly. But in our own islands the remarkable cheapness of most fabrics—excepting silk, but of which there are close imitations within the reach of the masses—has given the widest scope to the indulgence of the ruling passion; so much so, indeed, that a manifest tendency is shewing itself, amongst the court and aristocracy, to dress, excepting upon state occasions and gala days, as quietly as possible, and this in very self-defence. To this reaction we may perhaps look for a change of a more healthy nature; but as Fashion is as capricious as her followers, it is to be feared the chances against reform are remote.

We would fain hope that, from illustrious example, the tide will change for the better; but when we cast our eyes across the Atlantic, naturally hopeful that new worlds would inaugurate a more sensible order of things, we are shocked to learn that the struggle is not to shame the old country into propriety and prudence, but to excel her in the race of extravagance. Here is a sample of 'going ahead' in this direction, taken from the *Philadelphia Ledger*, from which, as we learn that the chief families of the modern community have commenced with their babies, we presume the mothers and daughters are not outdone by their offspring: 'At a juvenile party lately given in Brooklyn, Long Island, New York, by a lady aged eleven years, the extravagance in dress could not, it is said, have been exceeded even by adult ingenuity. The hair, dressed in the latest style, was frizzled, puffed, powdered, and adorned with flowers. Four-buttoned white kid gloves were generally worn; while French kid boots, matching the dresses in colour, encased the feet. A little girl of seven years was dressed in a rose-coloured silk, trimmed with *point-appliqué* flounces, and covered with gold and gems, which brought the cost of the outfit up to about seven thousand dollars. The young gentlemen of from nine to fourteen were usually arrayed in black dress coats, light pants, and in

lavender neckties, with the most dazzling profusion of rings, seals, and watch-chains. The hair of the elder youths was parted in the middle, and worn in long floating locks. Music, dancing, and flirtation occupied the evening until the supper-hour, at twelve o'clock, after which the gay assembly departed. The coquette of twelve and the effeminate dandy of fourteen are apt to suggest painful visions of a coming race of men and women without strength of mind or muscle, and with every spark of youthful vitality and freshness prematurely driven out by the training to which they have been subjected.'

Perhaps, however—to look at home—a little colloquy, which occurred in our hearing between a kind and generous father on the one side, and his wife and daughters on the other, may serve to illustrate the inconsistencies which enter into the defences and excuses for any abrupt change in fashion, however great.

'Don't you like our dresses, papa?' was the query, as Mr Signcheck's three handsome daughters entered the breakfast-room in the costume of the period.

'Humph!' replied papa, lovingly giving them the matutinal kiss in turn. 'You put the question in too beseeching a form to obtain my candid opinion. Ask it in a less arbitrary manner, and I will reply, "Not at all."'

'O papa, it is quite the fashion!' from all the ladies, deprecatingly, mamma included.

'Well, my dears, it may be the fashion, but that fact does not necessarily secure my approval. The dress is far too tight in front, and too carelessly loose behind; reminding me of a countryman's bundle wrapped up in a handkerchief, and tied with a slovenly knot behind, which he puts his stick through, to carry it over his shoulder. Indeed, it has really a painful effect upon me. When I saw the actor in the farce who was doomed to stand all the evening at a party, because he had not got his "sitting-down trousers" on, it did not excite my laughter, but my pity; and I really feel the same for you. Now, when crinolines were in'—

'O papa!' again from the ladies, 'you know when we wore crinolines, you declared them execrable, and all that sort of thing.'

'True, my dears. I did so, in common with many, denounce them as hideous, as destroyers of the human form, and a dreadful penance to a man who had to sit close by a lady who wore those parrot-cages. But that is no reason why you should fly to the opposite extreme, and adopt a costume which you can only find a precedence for on a willow-pattern plate.'

'Dear papa! it is you who are now inconsistent, not we.'

'Indeed! Well, to please you I'll plead guilty; but, in extenuation, let me fetch from my desk a few home-notes I jotted down at the time crinolines were the rage, and which fell from your own sweet lips, supported, you may recollect,

by the weighty arguments of your mother. Here they are. "Crinoline is the most convenient, comfortable, delightful, charming, and graceful part of our costume. It keeps our clothes off the ground, and out of the mud; gives free scope and action to our limbs, and extending the dress, avoids those plaits and folds which are the first to become frayed and shabby; and therefore crinoline has the additional advantage of being economical." Granted, my dears, I observed to this testimonial of its merits, and asked: Do these recommendations, presuming they are stable, outweigh the sad truth, that we are compelled to hear almost every day, of some sister, rich or poor, being immolated by fire within those ruthless bars? To this I find you replying: that it could only be great carelessness which caused such accidents; that accidents would occur, and that people would get accustomed to crinoline without danger, as they did to everything else. Indeed, for your parts, such was your love (that was your word) for these durling things, that you would never consent to set them aside, let the fashions change as they might. Had you abandoned crinolines because of the very many human sacrifices they had occasioned, I would have hailed the present costume, absurd and expensive as it is, as an acceptable and merciful change; but the screams of those who fell victims to these distended wires, were drowned in the louder behests of Fashion, and deaths the most excruciating went on and on, unheeded, till the fiat of Folly was trumpeted forth. Then they were no longer to be worn by the *élite*, for it became known that they were vulgarised by factory-girls hanging them up by order, like children's hoops at the school-door, before they entered the mills to work. Then, and not till then, comfort, convenience, grace, economy, were thrown with them into the lumber-room, or sold for a better purpose than they had served before, to the old umbrella-mender to repair his wares.'

'O papa, papa! there—don't!' and their taper fingers were over his mouth.

The father kissed each hand affectionately, and, with a sly expression of half fun and earnestness, added: 'There, then—you shall have no more of my lecture, if you promise not to announce every change in your dress with the assertion of its being all that's convenient and comfortable, and your determination to live and die in your new adoption, as many a poor woman has really done in that of the discarded crinoline. If you do not mind, I shall pull some more memoranda from my desk, and read them to the last word; for I have here your own advocacy of the Grecian bend and the Alexandra limp—both positive and practical imitations of physical affliction. And then, perhaps, you would like to hear how you used to rate the servants for going beyond the door with nothing on their heads, as not respectable; little anticipating that the time would come when you, their superiors, would deem a couple of rose-buds, and a piece of stuff the size of a cheese-plate, a sufficient substitute, in all weathers, for hat or bonnet.'

'Enough, enough, papa; we will promise,' said the eldest daughter, with a sly look. 'You have quizzed us girls, and we own, not without some

reason; but pray, is there nothing in *men's* dress that should demand change?'

'Men's dress! Indeed there is; and I will frankly own that, leaving out of count his carrying a chimney-pot on his head, the custom of wearing garments that apply equally to dinner, to a ball, or to a funeral, is one of the most absurd of the age. 'There, girls; we are now quits.'

LIGHTNING-PRINTS.

VERY curious results are sometimes produced by lightning, calculated to incite wonderment in the minds of persons unversed in the phenomena of electricity, and to set scientific men thinking and experimenting on the probable causes of these appearances. Of the destruction of ships and houses by lightning we do not speak, nor of the more lamentable cases in which persons have been struck dead by such visitations. The phenomena more immediately in view are *lightning figures* or pictures, impressions burnt into the surface of the objects struck, and presenting resemblances concerning which fancy has been allowed to draw fanciful conclusions.

Marks, remarkably tree-like, have sometimes been found on the bodies of persons struck by lightning. M.M. Bossut and Leroy, in 1786, reported to the *Académie des Sciences* a case of this kind, and accounted for it by supposing that the lightning in its passage through the body had forced the blood into the vessels of the skin, and thus all the ramifications of these vessels were visible on the surface. Arago adopted a similar explanation, in regard to a case which occurred in France much more recently: two persons standing near a poplar-tree were struck by lightning, and on the breast of each were found marks closely resembling the branchlets of the poplar.

More strictly belonging to those instances in which the lightning-marks resemble familiar objects is one that occurred in a Somersetshire village in 1812. One version of the story is, that 'six sheep reposing in a meadow surrounded by woods were killed by lightning; and when the skins were taken from the animals, a *fac-simile* of a portion of the surrounding scenery was visible on the inner surface of each skin.' The other version is that, about turnip-sowing time, a farmer and his men were engaged in the fields, when a violent storm of thunder and lightning came on, and three out of four valuable rams, which had taken shelter under a tree, were killed; when the skins reached the fell-monger, on the inside of each was found depicted a very accurate representation of the tree under which the animals had sought refuge. Although differing in details, these two accounts probably relate to the same occurrence; the latter is perhaps more credible than the former, seeing that we can more readily believe an impression of a *tree* than of a *landscape* being thus produced.

In 1846, at Graham's Town in South Africa, a flash of lightning struck the gable of a powder-mill. The building contained a store of twelve tons of gunpowder, in copper-bound barrels packed in a cluster about four feet from the wall. The lightning ran along the wall of the gable, beneath the floor, and out under the door-sill. The mark of the flash, zigzag in shape, and directed at an angle of about eighty degrees, was plainly visible on the

whitewashed wall of the magazine, resembling in colour the stain produced by the explosion of a very light train of powder; and a small hole or crack was made in the arch where it entered. There was no tree-mark or mystical mark here; the mark produced was evidently the zigzag path of the lightning itself.

Signor Orioli brought before a scientific congress at Naples four narratives relating to lightning-prints. In the first, lightning struck the foremast of the brigantine *Santo Buon Servo* in the Bay of Arriero; a sailor sitting under the mast was struck dead, and on his back was found an impression of a horse-shoe, similar to one fixed at the mast-head. In the second, a sailor, in a somewhat similar position, was struck by a lightning-flash on the left breast with an impression of the number 44; an almost exact representative of a number 44 that was at the extremity of one of the masts. In the third, a young man was found struck by lightning; he had on a girdle with some gold coins in it; and images of these were imprinted on his skin in the order they occupied in the girdle. In the fourth, an Italian lady of Lugano was sitting near a window during a thunder-storm, and was struck, though in a way scarcely conscious to herself at the time; a flower which happened to be in the path of the lightning was perfectly reproduced or printed on her leg, where it remained permanently.

Among the thunder-storms described as having occurred in the West Indies, one, in 1852, was rendered remarkable by this phenomenon: a poplar-tree in a coffee-plantation was struck by lightning, and on one of the large dry leaves was found imprinted an exact representation of some pine-trees that stood three or four hundred yards distant. Whether this was really an 'exact representation,' or the product of an excited imagination not well controlled by accurate judgment, is just the point which we cannot determine; the markings on the leaf may have been only the natural zigzagging of the lightning.

In 1853, a little girl was standing at a window, near which stood a young maple-tree; a flash of lightning struck either the girl or the tree, or both, and an image of the tree was found imprinted on her body. In another instance, a boy climbed a tree to steal a bird's nest; a lightning-flash struck the tree; the boy fell to the ground, and 'on his breast the image of a tree, with the bird and nest on one of its branches, appeared very conspicuously.'

Scientific journals, as well as those of more popular character, contain a rich store of incidents more or less similar to the above. Dr Franklin stated in 1786, that about twenty years previously, a man who was standing opposite a tree that had just been struck by lightning (or as he called it, by a thunderbolt), found on his breast an exact representation of that tree. M. Poey, who has treated this subject somewhat fully in the French scientific journals, mentions twenty-four cases of lightning impressions on the bodies of men and animals. Of those, eight were impressions of trees or parts of trees; one of a bird, and one of a cow; four of crosses; three of circles, or of impressions of coins carried about the person; two of horse-shoes; one of a nail; one of a metal comb; one of a number or numeral; one of the words of a sentence; and one of the back of an arm-chair.

There is no mention, so far as we are aware, of any imprinting on the bodies of the two hapless lovers mentioned by Gay; but a very little exercise of the imagination, aided by an element of credulity, would have sufficed to produce imaginary crosses, hearts, or trees. Those who know the story will remember that Pope and Gay were visiting at Stanton-Harcourt in 1718; that Gay described the incident in one of his letters; and that Pope memorialised it in verse. Two rustic lovers, John Hewit and Sarah Drew, about a week before the day fixed for their wedding, were at work with other harvesters in a field. A storm of thunder and lightning came on in the afternoon, and the labourers hastened for shelter to the trees and hedges. Sarah Drew, frightened and dismayed, fell in a swoon on a heap of barley, and John Hewit raked up some more barley, to shield her from the cruel blast: while thus engaged, an intensely vivid flash appeared; the barley was seen to smoke, and there lay the two lovers, he with one arm around her neck, and the other arm over her, as if to screen her from the lightning. Both were dead: her left eye was injured, and a black spot produced on her breast; while he was blackened nearly all over. Pope's epitaph on the hapless couple is engraved on a stone in the parish church of Stanton-Harcourt.

In all probability, no one explanation will apply to these several cases. The descriptions require to be examined closely; and they meet with the most consistent solution by separating them into groups. There is, in the first place, a love of the marvellous which induces some persons to stretch the truth in order to make up a striking story. Not habitually untruthful, they nevertheless yield to the temptation of so rounding off a narrative as to cause hearers and by-standers to make exclamations of the 'Good (Gracious!) kind. Other persons, repeating what Jack told Dick that Sam had heard Bob say to Bill, do not reflect how much a story gathers as it travels from mouth to mouth, until the final version bears but slight resemblance to the original. In another group of instances, a physiological agency of much importance has to be taken into account. Persons of nervous and excitable temperament, when under the influence of strong mental agitation, have been known to receive marks on some part of the body or limbs, corresponding in shape to the object which they were thinking of at the time; this is known to have occurred in other domains of human feeling; and there is nothing impossible in the occurrence of a similar phenomenon when the mind and the body are alike exposed to the action of a lightning-stroke. This was probably the case in regard to a French peasant-girl—one of the instances noticed by Poey: While tending a cow in a field, a storm came on; she took refuge under a tree; the cow fell dead from a stroke of lightning; the girl loosened her dress, that she might breathe more freely when nearly choked with agitation; and then she saw a picture of the cow imprinted on her breast. We give this story the credit of being truthfully told, and assign as the probable cause of the phenomenon a co-operation between a lightning-stroke and a vivid mental or nervous activity.

Where metal is concerned, the production of images or fac-similes may result more immediately from this rush of electricity which constitutes the

passage of lightning. Wherever metal lies in the path, the flash takes that route in preference to one through wood, brick, or stone; but if the metal be discontinuous or interrupted, strange markings are often produced on neighbouring substances, similar in shape to the piece of metal just traversed. This may have been the case in the accident which befell a young man in Cuba in 1828; after a lightning-flash, he found on his neck an imprint of a horse-shoe, similar to one nailed up on the window of a house near him. If the ornaments were of brass or some other metal, we might perhaps place in the same category the narrative (one of those given by Poe) of a lady, at her château of Denattonnière in La Vendée; she was seated in her salon, in November 1830, when a storm came on; lightning appeared, and on the back of her dress was imprinted a fac-simile of some ornaments on the back of a chair against which she was leaning.

There is every reason to believe, lastly, that many of the markings are nothing more than results of the forked zigzag course of the lightning itself. Mr Tomlinson, in his interesting volume *The Thunder-storm*, has gone somewhat fully into this subject. He had had occasion to observe the manner in which the disruptive discharge of electricity, from an electrical machine, marks out its path over a badly conducting surface, such as glass, and was struck by the tree-like impression produced. He gives a wood-cut representation of a surface struck by the flash or spark of a small Leyden jar; and it is impossible to avoid seeing how strikingly the markings assume the form of a tree. The probability is pointed out, that in cases where persons struck by lightning have had tree-like marks imprinted on their persons, they have been hastily considered to be real images of actual trees close at hand. It may, moreover, be observed that some persons, when struck by lightning, have received blue marks or bruises; these may put on a ramified appearance, 'not only from the irregular mode in which electricity travels about in search of the line of least resistance, but also from the smaller vessels becoming congested, and consequently visible.'

FALLEN FORTUNES.

CHAPTER III.—IN THE ROSE-GARDEN.

ALL rooms at Riverside Hall are good rooms, including those of the servants, which, instead of being ill-lit, ill-warmed, with sloping roofs and mere apologies for windows—such as are common in all those ancient mansions which we see pictured in 'Gentlemen's Seats' or 'the Ancestral Homes of England'—are comfortable, and of fair size; but even at Riverside there are distinctions. The guest-rooms appropriated for bachelors, for example, though well, and even luxuriously furnished, do not look out towards the front of the house.

The penalty inflicted upon unmarried persons beneath that hospitable roof is to have their view restricted to the croquet-ground, the rosary, and the hill-park (as it was called) at the back of the house. The stables are hidden away in a hollow, and approached by a secret way known only to the household, for it is not Mr Campden's habit, as it is that of many country gentlemen, to lead

his male friends thither after breakfast to discuss hocks and pasterns, and to inhale the fine flavour of the saddle-room, and worse. But even this back view is not to be despised by those, such as Mr Richard Holt, who have been shut up in Abdell Court, in the City of London, for eight hours a day through spring and summer, and doubtless that gentleman would have been enjoying it this morning, had he not had something more important to engage his attention. A goodly batch of letters had, as usual, arrived for him by the morning's post, and in their contents, though he is up and dressed, and sitting at the open window, he is rapt for the present, to the exclusion of external objects. He is one of those men—if you will take the opportunity of observing him—for whom the letter-bag has always paramount importance; men who do not mix readily with those about them, and find pleasure or even engrossing employment in the present; whose thoughts are semi-occupied, whose very gaze is filmed over, as it were, with the web of their projects. They are never sure of their movements, or of the length of their sojourn in any place; all must depend, they say, 'upon the afternoon post,' as though they were in a constant crisis of affairs, which a line of somebody's handwriting must settle for them one way or another: an unhappy class of people enough, but whose anxieties, let us hope, are not quite so overwhelming as they would have us believe.

It would be unjust, however, to accuse Mr Richard Holt of affectation; he is much too sagacious to be affected, and often finds circumstances much too serious to need any exaggeration of their importance. Indeed, it is just now his constant endeavour to avoid that appearance of pre-occupation peculiar to weaker brethren of his kind, and to play the part of a frank and easy-going man of the world—that is, of the thoughtless, high-placed, and luxurious world in which he finds himself, to confess the truth, for the first time. It must not, however, be supposed that our new acquaintance is a vulgar fellow. His appearance is good; he is six feet high, and well built; his large features, if somewhat grave and still, are capable of considerable expression, and if he looks old for his age—which is five-and-forty—he has looked about the same age for the last ten years, and will probably look no older for ten years to come. His eyes are hard, and he knows it; if he could make them otherwise, he would very gladly do so; he can smile, and speak softly, and his tongue has no lack of persuasion upon certain topics; but when his talk ranges beyond business affairs, he cannot get his eyes to accompany his voice, and the result is a want of harmony. People talk about the intense significance of the jaw and chin, and, very possibly (for there is no limit to such folly), of the lobes of the ears; but Mr Holt, who was no fool, and never attempted to deceive himself (whatever his conduct might be as respected others), knew that his eyes were not what they should be, and that it was a great misfortune to him. They were not ugly, by any means: not those hard-boiled ones, the balls of which project like the yolk of a stale poached egg; but long years of calculation and plodding, and standing upon his guard against rogue and scoundrel, had, as it were, set them, and they could never melt again either with love or pity, however nearly his heart might be touched by either.

However, he still finds them exceedingly useful ; one glance suffices to put him in possession of the contents of most of the letters that have arrived for him this morning, after bestowing which, he either tears the communication in small fragments, or places it in a huge pocket-book of Russian leather, which he always carries in his left breast-pocket, giving him the lopsided appearance of an amazon. Two notes, however, afford some cause for deliberation, and he gives each a second attentive perusal ; one is from his confidential clerk in Abdell Court.

'Mem.—Brooks has cabled as follows: "Sell Laras: whole concern a plant."' On another slip of paper was written: *'Dear Sir, on the whole advisable not to telegraph to you, especially as the Exchange had closed when the news arrived.'*

'Brand has got a head on his shoulders,' mused Mr Holt with a grim smile as he read those words; 'almost too good a head for my service. On the first opportunity I shall let him run loose.'

'Astor left yesterday, but with no immediate intention, I have reason to believe, of quitting England. I hope you find the country air is doing you benefit.—Yours truly, ROBERT BRAND.'

'Well, that is a good riddance every way, though I should have felt happier had the scoundrel put the seas between him and another; the last man in the world, however, as it happens, he is likely to foregather with. Master Philip knew too much.'

With a thoughtful brow, Mr Holt takes up the second letter that he had reserved from the batch, and for the second time examined the postmark, *Bampton*.

'This comes just in the nick of time, for the news it brings will shape my views about the mine. I shall have the whole day to think about how to play my fish. It was uncommon sharp of Brand to recollect that they had a private wire here, which makes all communications public.'

'I thought it, on the whole, advisable not to telegraph. Confound his sagacity! I will certainly get rid of him on the first opportunity, and select a less intelligent lieutenant. If he does not know too much, this shews he has suspicions, and I don't like suspicious people about me. "Bampton, Headquarters.—Our canvass is now over. The contest will be a narrow one. Mr Griggs will be the man."' That was all the second note contained, but it seemed to affect its recipient even more gravely than their first. 'Things are coming, then, to a crisis,' muttered he, 'and earlier than I expected.' He sat, plunged in thought, for a full minute; then, 'The man has nobody to thank but himself for what will happen,' exclaimed he, in a firm voice.

If 'the man'—whoever he was—had been standing before him in the flesh, and accusing him of having been the cause of his misfortunes, his denial could not have been more earnest and explicit. As he spoke, a clear and ringing voice made the air musical without:

'Birds in our wood sang, ringing through the valleys:

Maud is here, here, here—in among the lilies.'

He started up excitedly, his ordinary pale cheek flaming crimson, as a man flushes when another has given him the lie; but as the song went on, a curious change came over him. The lines of

thought and care seemed to grow faint upon his brow, and the whole expression of his face to soften; his lips parted with a smile, and he lifted up his hand for silence, as though he had not been alone:

'I kissed her slender hand; she took the kiss sedately;

Maud is not seventeen, but she is tall and stately.'

Holt smiled softly towards the window, and, keeping himself concealed behind the curtain, peered cautiously through its folds.

In the rose-garden, as it was called, from the flowers to which the little plot of ground was exclusively devoted, and immediately beneath the window, stood Kate Dalton, in the act of plucking a bud which she had just selected from a bunch that grew above her head. Her face was full in view; the morning sun shone on her bright tresses, and transmuted them to gold; its beams darted at her eyes so lovingly that she was forced to almost close them, so that their long silken lashes were made plainly visible; the position of the rosebud necessitated her standing for an instant on her toes, and exemplified that particular grace of which the employment of high-heeled shoes is supposed (very erroneously) to supply an imitation; the extended arms lent a fullness to the otherwise too slender bust; the shapely head seemed to be crowned with nodding roses. It was indeed 'a picture to make an old man young;' and upon Richard Holt, who was by no means old, according to his own reckoning, it had a very singular effect—it made him giddy. His head went round with him; his heart sank, down, down, with a feeling of sickness; and for the moment he clung to the curtain, to steady himself, if not to preserve him from a fall. The next moment he had stepped quickly across the room to his dressing-case—not the solid and elaborate affair that such articles generally were at Riverside, but a mere roll of leather containing various articles of the toilet—and taken from it a pair of scissors. Slipping these into his pocket, he left his room, and descended the stairs with hurrying steps. The breakfast-parlour, though empty, save for an attendant, had all things prepared for the morning meal; but he passed by the door, and out into the hall. He paused for an instant at the hat-stand, doubtful whether he should select the 'chimney-pot,' which he usually wore, and which he knew suited him best, or the 'wideawake,' which he had brought down in compliance with the fashions of the country.

Unluckily for his personal appearance, he chose the latter, which had the effect of a clumsy disguise. It took away from him his City air, it is true, but substituted for it that of some confidential servant who has the immediate reversion of his master's clothes. Aristocracy has not yet issued a stamp by which even the most distinguished member of it can be recognised in a bad hat; nor is it every one who can 'carry off' even a wideawake. The newer it is, the worse it looks on some folks; and the wideawake of Mr Richard Holt, of Abdell Court, was very new. If the handle of the pair of scissors that were lying in his breast-pocket had been but visible, one would have set him down, probably, as a master tailor.

It was not in the nature of things that Mr Holt should run, but he moved rapidly across the gravel

sweep, and through the shrubbery that led by devious ways to the rose-garden, and arrived there just in time to see Kate Dalton—kissed. It is terrible to have to record it, but it is the truth—kissed by a young gentleman. There was no time for Mr Holt to restrain his headlong speed, and to pretend not to see it. His position was precisely that of the spectator described in that famous ballad, of which all the verses save one have been lost in the mists of time:

I saw Esau kissing Kate,
And the fact is we all three saw;
For I saw Esau, he saw me,
And she saw I saw Esau.

Only in this case it was not Esau; for Esau, we have reason to know, was a hairy mau, and the offender on the present occasion had a cheek as smooth as a girl's. Hair is not hair (and how true this of many a native-looking chignon) when it is down, and Jeff's lip had only down to boast of. This may not seem of much consequence to the reader, but to Richard Holt it was a great mitigation of the shock which he experienced. The attachment of a boy and girl is never more ridiculous and immaterial than in the eyes of a middle-aged man who himself has only just begun to feel Love's dart. Moreover, Master Geoffrey Derwent's lips had only saluted Kate's fingers, and there is really nothing in *that*; for does not the Queen herself permit the same liberty to mayors and consuls? Nay, even for this transgression, there had been a very sufficient cause, had Mr Holt but known it. He had last set eyes on Kate, you remember, when she was reaching for the rosebud, and trilling that exquisite little verse:

I kissed her slender hand; she took the kiss
sedately;
Maud is not seventeen, but she is tall and stately.

At that instant, if Mr Holt had not been in such a hurry to bring the scissors, he might have heard a merry voice chime in with:

'Maud is tall and stately, but not tall enough to reach that bud without assistance;' and then a longer arm than hers interposed, and drew down the flower. When he had done that—not in a hurry, you know, but with a quiet deliberation and ever so much solicitude to remove the thorns from the stalk, it was only in accordance with the eternal fitness of things that he should 'kiss her slender hand;' and it is my firm conviction that she would have taken it 'sedately' enough, but for Mr Richard Holt's unexpected intervention. As it was, though her face flushed like any rose around her, she merely observed: 'How rude you are, Jeff;' then turned to the new-comer with a cold 'Good-morning, Mr Holt.'

If she had been seventy instead of seventeen (she was in fact eighteen), she could hardly have carried off that little incident with greater sangfroid or more perfect self-command.

Master Jeff, on the other hand, a tall and comely lad, with light hair, but bright black eyes, glared haughtily at the intruder, as though the rose-garden had been his own private preserve, which the other had violated; while Mr Holt stood dumfounded, and slowly produced his scissors.

'I saw you from my window yonder, Miss Dalton'—he looked up towards it, as though for

corroboration of his story, but her eye did not follow his; she looked as though, if there was one thing on earth absolutely indifferent to her, and without one scintilla of interest, it was the situation of Mr Holt's apartment; 'and remarking that you had a difficulty with your friends—or may I say relatives? for there is a strong family likeness—the roses, I brought you this pair of scissors.'

'Thanks,' said Kate, not taking them from his hand; 'but I have gathered all I want.'

She had but two buds, one of which she carried in her left hand, and the stalk of the other she was now tying to a leaf or two with a piece of silk, getting it obviously ready for somebody's button-hole.

'That new word 'Thanks,' so common in young ladies' mouths nowadays, seems, somehow, to lack the warmth and grace of the old 'Thank you,' and to Mr Holt's ears it now sounded particularly cold.

He stood snipping the scissors, for want of something to say or do, and gazing longingly at the little bud, which she had by this time transformed into a fairy bouquet. Kate's heart, which had been hardened by his *mal-à-propos* appearance, began to feel some pity for this man, to whom she had certainly been somewhat discourteous.

'Mamma tells me that you have been so kind as to sacrifice yourself for Tony's sake, Mr Holt, so far as to accompany him to the sports at Blea-barrow. Jenny was "spurring" him, as he calls it, through his *César* this morning, in order that he might go off to them early.'

'It is no sacrifice, I am sure—that is, if I can ever be of any use to you or yours, it never seems so.'

'I don't see why Mr Holt should trouble himself,' said Geoffrey, 'since I promised Tony to take him long ago.'

'Yes; but then, you see, you are but a boy, like himself, Jeff,' observed Kate: 'it would be like the blind leading the blind, to trust you with Tony among all those queer rough people.'

'I don't think them at all queer,' returned the lad brusquely; 'they are honest and hearty folks, who never do harm to anybody, except now and then to themselves, through taking too much beer.'

'But then they don't know *what* they do,' remarked Mr Holt mildly, delighted to find Kate and himself conducting this little argument in concert.

'Just so,' said Kate.—'Now, don't be cross, Jeff, merely because you have not arrived at years of discretion, which is a question of time, you know, though to some people of a very long time.'

At this Mr Holt laughed approvingly, though Kate had shewn no such appreciation of his allusion to her likeness to the roses, which he had thought particularly happy and opportune.

Jeff took no more notice of his laugh, nor of his remark, than if he had not been present.

'Of course, I knew that Mrs Campden would object to my going with Tony—she always does object to my doing anything—but I should have thought your mother would have trusted me, Kate.'

'Certainly, my dear Jeff, mamma would trust you; she always says you are the best of boys.—There now, you are taking huff again: and here's a rosebud for your jacket—I mean your coat.' And with that she placed the little nosegay in his

button-hole, while the young fellow thanked her with his eyes.

'That should make amends to Mr Derwent for anything,' said Mr Holt significantly, as the three moved slowly towards the house. 'I am sure I would submit to be distrusted.'—

'Or even to be called too young,' interrupted Jeff, stung into unaccustomed epigram.

'Certainly I would submit to that indignity,' continued Mr Holt, good-naturedly—though his unhappy eyes would not look good-natured, in spite of all his efforts—'and indeed to any other, for such a guerdon.—You have still another flower, I see, Miss Dalton, and remember, I *did* bring you the scissors, though I was too late.'

'You are too late again, Mr Holt,' answered Kate gently, as they ascended the steps at the front-door; 'I have only this rosebud left, and I always give one, as you know, to Uncle George.'

CHAPTER IV.—MRS CAMPDEN ORDERS THE PONY-CARRIAGE.

Mr Campden was not Kate's uncle, being only, even by marriage, a distant cousin; but the relations between him and the Daltons were so cordial, that the junior members of the latter family always called him by that title—which I am not quite sure that his wife relished, since she who was the blood-relative was never entitled aunt. He was a bluff, kindly man of some fifty years of age, and though he had always been engaged in commerce—till Fortune had filled both his pockets and enabled him to retire on his gains—his appearance was that of a thorough country gentleman. That he possessed some astuteness, his great success attested; while that he had some ideas beyond mere money-making was certain, from his choice of Riverside as a residence; but these mental gifts would never have been guessed at by ordinary observers; indeed, Machiavelli himself would have been puzzled to make much of Uncle George, since he rarely opened his lips save to admit his meals or the end of a cigar. His existence had been, in fact, absorbed by the superior vitality of his wife. It had not, indeed, been always so; there were some who professed to have seen him make some show of resistance to her indomitable will; but though her seizure of the poor gentleman had been very gradual—inch by inch, as a cobra swallows a rabbit—he had never recovered any portion of himself that had once been appropriated, and the process of deglutition had long ago been completed. Mr Campden still drew his breath independently of his wife, and that was all: he never attempted to shape it, without her leave and license, into a word of command, or even the expression of a wish; at times, when elated, he would break out into a confession of his own state of thralldom—as a helot in his cups might have done—in which there was a touch of humour, bearing witness that he had some individuality still left in him; but these little jets of independence grew every day more rare, and it was plain that their source was drying up. If he had been a septuagenarian married to a young girl of twenty, his thralldom could not have been more complete than it had become of late, and an old friend had on one occasion taken the liberty to tell him so. 'I know it, my dear fellow,' he had replied, without a trace of irritation at this plain

speaking; 'and, unhappily, Julia is more than twenty.'

Indeed, there was no reason—absolutely none—to a looker-on, why Mrs Campden should have got her husband so entirely under her thumb. She had not been very young when he married her, not very pretty, nor particularly accomplished; and whatever might have been her attractions in these respects, they had certainly not improved with years; yet every year she had placed him in closer bondage, till he could now scarce move hand or foot. He had still, however, a smile for everybody, and it was universally understood that he would do a good turn for any one, unless his wife had issued a special ukase to the contrary. He was amazingly popular with all young people, and, indeed, with old ones also, although the more thoughtful of his friends regarded his state of servitude with just contempt. 'When a man is downright henpecked,' said John Dalton, 'it almost always arises from his having committed peccadillos which have come to his wife's ears; but poor Campden has no such "set-off" to comfort him; he has fallen a victim to his Julia through sheer indolence.' And this was the true state of the case. Moreover, it cannot be denied that Mrs Campden possessed that gift in reality which is always imputed to those members of our governing classes who have nothing perceptible to recommend them—administrative capacity. She was essentially a managing woman, and would have swallowed everybody else, inch by inch, if she had had the chance, just as she had swallowed her husband; her love of power had 'stomach for them all'; and yet a more unambitious and 'ordinary' looking little woman than Mrs Campden it is not easy to imagine. Even now, as she sits at the head of her own breakfast-table, there is nothing of despotism in her look or manner; and only by the unusual quickness with which the servants execute her orders, and wait upon her rather to the exclusion of her guests, would you guess her to be the Tartar she really is. Her skin, however, though not particularly delicate, is of that unfortunate kind that betrays emotion, and her pale face will glow like a peony on very slight occasion; her voice, too, which is unusually thin and low, will, if opposed, become metallic. Curiously enough, this is the case, though in a less degree, with Miss Mary also; and when mother and daughter have their little wrangles—in which the latter is always discomfited—their argument at a little distance resembles the dropping of copper coin—as if they were playing 'odd and even' for halfpence.

This morning, however, Mrs Campden is all smiles and harmony; she has just succeeded in persuading Mrs Dalton, who sits on her right hand, to accompany her in her pony-carriage, that afternoon, for a long drive; and her victory has flattered her, for she knows that Mrs Dalton did not want to go, being anxious upon her husband's account, who is sure to telegraph to her at the close of the poll.

'My dear, that is just the reason I wanted to take you; the time will pass quickly (I hope) in paying our little visits; and once away from the house, you will cease to fidget about the news that may come from Bampton.'

'Well, as you please, my dear Julia; but I am afraid I shall prove but a dull companion,' sighs

Mrs Dalton, after some attempts at escape—as vain as those of a gold-fish in a glass bowl.

'I have never found you *that*, dear Edith,' answers her hostess laughingly.—'I wish, Mr Holt, that you were as certain of having a pleasant afternoon, as I am with Mrs Dalton. I fear you will find our Bleabarrow festivities very heavy.'

'Yes, indeed, I am sure it is most kind of Mr Holt to go with Tony,' said Mrs Dalton; 'for though I have the utmost faith in Jeff—here she slid her hand down to Geoffrey's knee, who sat beside her, and patted it, in sign of affectionate confidence—his good-nature has made him too much of a playmate with my boy, to admit of his ever using due authority.'

'Oh, *that* is not to be thought of for a moment,' observed Mrs Campden austerely.

'I don't think any harm is likely to happen to my young charge,' smiled Mr Holt; 'unless he should insist upon competing among the light-weights.'

'And why not, if there are boys?' inquired Tony earnestly.

'Oh, how shocking!' cried Mrs Campden. 'That would be a pretty thing for a young gentleman to do: to wrestle with all these vulgar creatures.'

'It would be only excusable if he were standing for Bampton instead of his father,' observed Mr Holt; 'then, indeed, it would go down very well, as a proof that, though a Whig, he had got no pride about him.'

'By-the-bye, Mr Holt, you have not chanced to hear anything this morning about the election, I suppose?' inquired Mrs Dalton; not because she thought it at all probable that he had done so, but in order to anticipate any question upon his part which it would be embarrassing to her to answer.

'Not a word,' answered Mr Holt, touching at the same time—whether in proof of his veracity, or to convince himself of the safety of the manuscript—the breast-pocket which contained the memorandum from *Headquarters*. 'But your husband is sure to telegraph directly the thing is certain.'

'Oh, I *know*,' said Mrs Dalton; 'and that is why I was rather wishing to stay at home this afternoon;' and she cast an appealing look towards the mistress of the house. Whatever that lady had once acquired, however, whether promise or concession, she never dreamed of giving up again, but used as a possession of her own, and a basis from which to start in search of further gains.

'You would not object if you and I were to lunch a little earlier than the rest, Edith, would you,' inquired she, 'as we have a good many calls to make?'

'Certainly not,' said Mrs Dalton: the earlier she started, as she fondly hoped, the earlier she would be permitted to return and receive dear John's despatch. But she reckoned without her hostess.

'That's right, my dear; I knew you would not mind; and that will just enable me to push on as far as the Park, and call on Lady Brodie, who is generally a little beyond my beat.'

CHAPTER V.—MR CAMPDEN ORDERS THE BAROUCHE.

Thus, therefore, it came about that, at the usual luncheon-hour, four of the breakfast-party had gone their ways, and there were gathered around

the great table only the host and the three young ladies—for Jenny generally made her appearance at the mid-day meal.

'Now, Uncle George,' said Kate merrily, 'I hope you are going to be very polite indeed to us girls, because, you see, we have no other cavalier.'

'Don't say polite, Kitty,' cried Jenny; 'don't waste your opportunities like that; of course he'll be polite; say *devoted*.'

'My dears, I *am* devoted,' said Uncle George; 'very much so indeed. If I can do anything to please you, pray, mention it.'

'He is a nice old papa; he really is,' remarked Miss Mary, like an auctioneer who is recommending some article to an audience who have doubts.

'He has done himself a mischief already, upon your account, young ladies, by eating luncheon out of courtesy; let me tell you *that*,' observed he.

'O papa, how *can* you say so, when you know mamma always cries out if you have two helps of meat, as you did to-day; and you had bottled stout too!'

'All for your sakes, my dears: I felt that what Curzon calls "support" would be necessary if I had to amuse you young people. And now I am prepared for further sacrifices. Suppose I take a glass of sherry.'

It was very unusual to see Mr Campden in such a lively mood; he was generally as dumb as any china figure, and almost as motionless; now he was more like something in india-rubber from which a weight has been removed, and which assumes its natural shape with elasticity. It was only very seldom that his wife was away at meal-times.

'My dear papa, then you will go to sleep, and be of no use at all.'

'Not a bit of it; I am all for exertion. Now suppose you and Kitty row me about on the river, and Jenny steers.'

'Oh, Uncle George, we have got blisters on our hands already,' said Kitty, 'from rowing you about: you are certainly very lazy.'

'Well, supposing you girls dress up in Eastern costume—you are fond of dressing up—and come and dance before me. Pretend to be nautch-girls (if that is the way you pronounce it); and Jenny shall clap my hands together—if I like it—for applause.'

'It is a capital idea,' cried Jenny. 'Let us get out all Mrs Campden's beautiful Indian shawls, and do the thing completely.'

The three girls burst out laughing, partly at the audacity of this proposal, but principally at the very long face which it caused Mr Campden to draw.

'I don't think that will quite do, my dears,' said he. 'Now, what do you say to billiards? Mary and Kate shall play, and Jenny shall mark; and I will shew *how* you ought to have played when you make mistakes. That will give me a good deal to do, but I don't mind.'

'You are very rude, Uncle George, instead of being polite, far less devoted,' said Kitty.

'Well, my dear, I only threw out these ideas as mere suggestions. If you are for archery, I can pull the bow against anybody, though I can never, somehow, shoot off the arrow; and as for croquet, there are doubtless more stupid games than croquet, though I confess I have never seen them.'

'But Jenny can neither shoot nor play croquet, papa,' observed Mary softly.

'Oh, pray, don't mind me,' said Jenny with a little flush. 'I shall be very happy looking on.'

'My dear Jenny, a thousand pardons,' cried Mr Campden vehemently, his ruddy face becoming quite purple. 'It was the stout that made me so stupid. The only amends I can think of is to leave our occupation for the afternoon entirely in your hands. Let the rest of us be Miss Jenny's slaves, and do whatever she pleases. What do you say, girls?'

'That will be capital!' cried Kate and Mary simultaneously.

'Do you really mean it, Uncle George?' asked Jenny gravely.

'Unquestionably, my dear. I feel already like Herod when he had made that imprudent promise to his step-daughter—but my word is passed.'

'But there are so many deliciously naughty things that I should like to do, Uncle George,' said Jenny thoughtfully. 'It has long been my desire to go out in the steam-yacht with a few friends who do not in the least understand the machinery, and to see what will come of it; whether it could ever stop or not, of itself; and what we could do beyond making it whistle.'

'I am truly thankful to say,' observed Mr Campden piously, 'that there is not enough water in the river to float the steam-yacht.'

'So am I,' cried Kate and Mary, also gratefully. It was well known to both of them that Jenny was afraid of nothing, and that her love of danger and excitement was in inverse proportion to her feeble physical powers.

'Well, then—it is a great bathos, after my steam-yacht notion—but, next to that expedition, I should like us all to go to Bleabarrow to see the wrestling.'

'Oh, how delightful!' cried Kate.

'Oh, my goodness!' ejaculated Mary, 'what will mamma say?'

Mr Campden poured himself out another glass of sherry, and ran his hands through his thin thatch of gray hair. Beneath his breath he might have been heard to murmur 'Gracious heavens!' but the expression of his face was pretty firm.

'You think you would enjoy that sort of thing, Jenny? I mean, these games?'

'I am sure I should—that is, looking on at them. I should not make much of wrestling myself. Jeff says it's a noble spectacle; and Jeff will be there, you know, and dear Tony; and Mr Holt. Fancy how surprised they will be to see us! They will scarcely believe their eyes. Come, Uncle George, you'll keep your word.'

Mr Campden swallowed the sherry, and rang the bell—for the discussion had lasted long after luncheon was over, and the servants had retired to their own mid-day meal.

'Jeff took the dogcart,' observed he, 'and my wife the pony-carriage.'

'Then we had better take the brougham,' suggested Mary.

'No, my dear; I think the barouche would be more comfortable for all of us; and, besides, it will afford a better view.'

'Uncle George, you are thinking of what will be more comfortable for me,' said Jenny softly.

'Well, it would not do to forget you twice in one afternoon, my dear,' was the pleasant response.

'Now, go and get your things on, girls, that we may start at once; and then we can get back

pretty early, you know—before your mamma comes home.—John, let the barouche be at the door in twenty minutes.'

He had not issued such a command without consultation with that barouche's mistress, far less in direct opposition to her, for twenty years.

'My dear Jenny, I am quite jealous of you,' cried Mary Campden, as the girls trooped upstairs together, to attire themselves for the anticipated treat. 'I am sure no seductions of mine would ever have persuaded papa to do such a thing. Why, it quite "partakes of the nature of a lark," as Jeff calls it; does it not?'

'She must have "given him medicines," as Falstaff says, to make dear Uncle George so complaisant,' laughed Kitty; she was a young lady who liked Shakspeare better than the musical glasses, and had a very pretty 'trick of iteration.' 'She has certainly given him medicines.'

'No, my dears,' said Jenny decisively; 'it was neither my charms nor my medicine—though some people do take it medicinally; we owe everything to that second glass of sherry.'

THE WILD SPORTS OF BRITTANY.

IN a work lately published, entitled *Wolf-hunting and Wild Sport in Lower Brittany*, the author is careful to remind us that the adventures which he chronicles happened twenty years ago, but he has every reason to believe that repetitions of them must still occur.

The curious little Keltic town of Carhaix formed the author's headquarters for hunting in the vast mountainous forests of Dualt and Huel-goed. This is a country of savage moorland, clothed in heather and broom; these pass into gloomy woodlands, broken up into ravines, and crowned by mountains, where the bare granitic breaks out in rugged blocks piled one above another (like the Dartmoor 'clitters'), which afford shelter to wolves and foxes, wild swine, wild cats, badgers, and the like. A wolf-chase is a striking feature of life in Brittany. The common wolf (*Canis lupus*) is found all over Europe, from Egypt indeed to Lapland; and it reaches over Asia into India; but its habits appear to vary in different countries. Thus the Russian wolf is peculiarly savage. In Bengal the wolf even turns man-eater, like the tiger, and frequently carries off children in broad daylight. But the Breton wolf seldom or never touches man. He is not often seen in summer, but in winter he joins several neighbours, an old one with half-grown cubs, maybe, and prowls around the cabins of the peasantry to kill their sheep and horses. Pressed by cold and hunger, they then become very daring and destructive. Horses are seized by the throat, and at once killed and eaten. Dogs are very dainty morsels; and in some winters it is necessary to light fires nightly at all the road entrances into Carhaix, Callac, Gourin, and other neighbouring towns, in order to preserve the cattle and dogs from their devastations. The outlying peasants drive their few sheep and cows into the huts with them at night, while the baffled wolves

keep up a melancholy chorus of howls outside, and not unfrequently, mounting the roofs of the cabins, tear a way in through the broom and heather which form the thatch. A thrilling story is told by our author of a doctor, compelled to ride to a distant patient after nightfall one winter's evening, who was pursued by a small pack of wolves, and kept them at bay, as he fled, by lighting matches, and a liberal use of his hunting-whip. The fear was, lest they should spring at the horse's throat, when the rider would probably have been also torn to pieces in the *melée*. But children of five years old frequently watch their father's black cows and sheep in the forests with perfect impunity. The wolf in Brittany respects the dominion of man. It was not always so indeed. In the desolation and brigandage ensuing upon the War of the League, it is upon record that the wolves got the upper hand, and fearlessly hunted men into the towns. And the belated peasant in Brittany still shudders in dread of the *Loup-garon*, or demon-wolf, a phantom which has evidently sprung from these and the like old tales of horror and atrocity in which wolves played a part.

Early on a November morning, the sportsman who intends chasing a wolf will be roused by numerous blasts of trumpets, by eager shouts and trampling of *sabots* in the street below, for every Breton, townsman or peasant, is a keen hunter. In the gray dawn, mounted on a sure-footed horse, he trots along with the *louvettier* (or wolf-slayer) of the district, his friends, a motley assemblage of huntsmen, and a pack of keen and powerful wolf-hounds, towards the mountains. Probably he meets a violent storm, for these sweep in from the Atlantic and break in torrents of rain on the Black Mountains. The regular huntsmen carry *couteaux de chasse*, and that huge circular horn round their necks and bodies which affords such endless amusement to English sportsmen. Blasts on this dignify the proceedings, at the same time that they keep the hounds together. The peasants are dressed in the usual costume of the country—tight goat-skin jackets; canvas trousers, also fitting tightly, and buttoned down to the ankle; heavy *sabots*, stuffed with hay; and round-crowned broad-brimmed hats, beneath which depends their long curly hair. They too carry in their hands what seem to English eyes poaching weapons, huge antique firelocks discharging *balles-mariées* (two bullets joined together). The wolf is so destructive to them that no quarter is given to him. The *louvettier*, however, with the instincts of an English Master of Fox-hounds, is very careful of the breed, will not kill too many in one neighbourhood, and though his business ostensibly is to slay and exterminate the whole race throughout his district, would shudder at the idea of reducing the stock too much. Still, he politely manages to conceal these sentiments from the peasants. Their huge iron wolf-traps are his peculiar aversion, partly because they destroy his quarry in an un-

sportsmanlike manner, but still more because his hounds are occasionally killed or badly maimed in them. These hounds are fine, bony, fierce animals, standing some twenty-six inches high at the shoulder. They have a cross of the wolf in their breeding, which is found to make them desperate in the chase and untiring. Their only defect, perhaps, is that they are somewhat too fond of running silent; but by choosing the more noisy dogs, and carefully keeping them for the sires of the pack, this fault is in great measure remedied. Owing to the vast forests and rough ground over which they have to work, it is very difficult to train wolf-hounds in Brittany. For first, there is a variety of attractive scent (foxes, hares, martens, &c.) to withdraw them from their proper quest; and secondly, the huntsmen can scarcely penetrate the thick covers, unpierced as with us by 'rides,' in order to administer correction or check riot, when the pack settles down to it in earnest. Besides this, the scent of a wolf is at first distasteful to young hounds, which are rather inclined to set up their bristles and retire to the *piqueur's* heel, than to follow it up. The force of society and emulation, however, soon cures this fault, so that one or two old hounds kindling well to their work speedily light up a like flame in well-bred dogs.

The mode of hunting a pack of wolf-hounds in such a country as we have described is peculiar. It consists in placing a 'lyme-hound' (as our ancestors termed a blood-hound), a *limier*, as modern French venery calls it, on the track of a wolf which has been discovered by the *piqueur* at early morn returning to cover from its nightly rambles. As the *limier* warms upon the drag, a few steady old hounds are uncoupled; and when they settle down well upon the scent, the next batch of trusty hounds is added to them, and so on, until the puppies are entered and encouraged onwards with voice and horn. It must be remembered that besides the nature of the country, the variety of animals which these hounds are expected to chase—deer, boars, wolves, and foxes—necessitates this method of hunting. It seems somewhat barbaric to those who are familiar with the opening burst of Her Majesty's stag-hounds, or the united manner in which the Pytchley pack hunts its fox.

But here we are at the edge of the forest of Trefranc. The *piqueurs* and lyme-hounds are ready to begin; and a large number of the peasants, some with fire-arms, others with knob-sticks, used as walking staves (with the knob invariably on the ground), stand eagerly waiting for the *louvettier* to give the signal. Two or three *gendarmes* survey the assemblage with a critical eye, in order to pounce upon any *ouvrier*, or peasant, carrying a gun without a *permis de chasse*. But the *louvettier* and his mounted friends, with another peculiarity of the French chase which is incomprehensible to our insular minds, are wasting precious moments, and still more precious enthusiasm, on the part of men and dogs alike, in much excited conversation and violent gesticulations. This is the indispensable palaver about the right place at which to throw off, the number of hounds to be uncoupled, &c., which is always held at the cover-side. Twenty minutes having been thus wasted, the *piqueurs* advance with the lyme-hound, which at once begins its deadly but silent quest. The horsemen ride rapidly off, to station themselves at

likely spots for the burst ; while, horror of horrors to English eyes, the peasants post themselves at each coign of vantage with their guns at full cock ! Their harmless-looking, unarmed brethren also run off to the thick cover, where each man discards his staff, and recovers his gun, which has been hidden from the *gendarmes* under the heather. They also betake themselves to good outlooks, and stand ready to pour a relentless fusillade of slugs upon the hapless wolf, wherever he attempts to break cover, utterly regardless of those who happen to be in the way. And now the brace of leading hounds are put on the lymie's track, and at once raise the merry notes which signify that the game is afoot. The *louveter* winds his huge horn, sets spurs to his horse, and dashes over granite blocks, broom bushes, fallen trees, and waist-deep heather, in a way which can only be witnessed in England at the chase of the red deer on Exmoor. Off go the rest of the horsemen in his wake. The wolf has kept to the wood, and thereby defeated the good intentions of the musketeers, who are at once thrown out, and follow, in hopes of eventually getting a shot by means of taking short cuts, and descending cliffs which compel the rest of the hunt to adopt a circuit. More hounds, meanwhile, are laid on, and the echoes of wood and cliff ring again to the headlong music of the pack. Like a whirlwind, it sweeps onwards into the valley. Up the cliffs of bare granite the wolf once more doubles for dear life, the huntsmen pursuing, some above, some in the defile. Again the creature betakes himself to the valley, and makes for the brook which runs through it, in hopes of either puzzling his adversaries or obtaining a safe place for turning at bay. But three of the peasants have by this time arrived at the head of the vale, and on viewing him below, forthwith open fire upon him. Amidst loud cheering from above, the gallant pack rush upon their foe before he reaches the water, where the struggle is by no means one-sided, the wolf dealing severe bites right and left with great impartiality. The *louveter*, in much fear for his hounds, drives his horse down a gap in the bare rock-wall, which no one in cold blood would dream of facing, gallops up to the snarling combatants, leaps down nimbly, and with his *couteau de chasse* deals the death-blow. Then the rest of the hunt ride up, and the *mort* is solemnly wound on the horns. The hounds meanwhile don't 'break up' the wolf, after the manner of English fox-hounds running into their game ; they do not even tear his skin, and scarcely disfigure the thick hairy covering of his huge limbs ; 'yet for at least half-an-hour,' says the author, 'every tooth in their heads and every muscle in their bodies is concentrated on the wolf's body, biting, shaking, and dragging it furiously.'

In order to realise the size of a Breton wolf, it may be noted that one measured after being thus hunted, proved to be ten inches in circumference round the fore-arm, just below the elbow ; while its canine teeth, measuring them only above the socket, were at least an inch and a half in length.

The chase of wild swine by the same pack of hounds, and in the same manner, is related with much animation. These destructive creatures ravage the crops of the peasantry ; whole fields of potatoes are upturned by their snouts ; standing corn, if not eaten, is trampled down like stubble

into the earth ; and during the autumn, the chestnuts, which form great part of the labourers' winter supplies, are frequently devoured. Harboured by day in the recesses of thick forests and in inaccessible caves, little droves of pigs, led usually by a master-boar, descend upon the cultivated spots at night ; the peasantry being powerless without the aid of the *louveter* and his hounds to protect their property. Trees are often found scored with the creatures' tusks, just as the tiger loves to tear the bark of some favourite tree with his claws. On being roused and hunted down, the sportsmen emulate the countrymen in shooting the pigs as they rush by, being careful to take up their position beside a tree with overhanging branches, into which they can leap up and cling to, if the infuriated animals, as frequently happens, charge them. Our author on one occasion had to perform this feat with great celerity, or he would have suffered considerably. At another time, a fine boar was run to bay on a rocky ledge beside a river, where he could only be approached by swimming, and it was impossible to shoot him, for fear of harming the hounds. Speedy action, however, was necessary, for he was dealing death and destruction upon them every minute ; so a man, ascending the precipice behind where the animal was posted, dropped an immense mass of rock, and swept him into the current, where the surviving dogs soon finished him. Another took refuge in a cave, whence he had to be smoked out, and being shot, was found to weigh nearly four hundredweight. This was a *solitaire*, and such a wild boar always makes a long fight for life. The peasantry assist in these hunts with even greater eagerness than when a wolf is chased, as the death of a pig means not only immunity for their crops, but a good store of meat for themselves ; the custom being, that the *louveter* should divide the slain quarry amongst the natives of the district. One day, in the great cover of Laz, five pigs were killed, which weighed on an average at least two hundredweight each ; these being divided into quarters, half a hundredweight of the best chestnut-fed pork thus fell to the lot of no less than twenty peasants. This sport is attended with considerable danger, not only, as has been seen, from the pig's charges, and the volleys of slugs which the farmers discharge almost at random on the appearance of the animal, but still more if a hunter attempts (as must be done, for the dogs' sake) to despatch the creature at bay by means of his *couteau de chasse*. One dexterous thrust must be dealt, for, unless a vital part be struck, the hunter runs the risk of his life.

The other wild sports treated by our author are of a quieter nature, admitting of little novelty in their telling ; but his enthusiasm and sense of enjoyment captivate the reader quite as much as when larger game are in question. The alder-beds and oak copes of Ty-neur, in Finisterre, afforded excellent woodcock-shooting. The English style of penetrating the boggy covers, and taking snap-shots at the birds as they rise among the stems of the trees, was found to secure larger bags than the more cautious method, which seems universal in Brittany, of having the covers worked by spaniels, and remaining on the outskirts to shoot such birds as there emerge. During snow, the sportsmen could secure twelve couple of woodcock per head daily. How English squires must envy such bags!

With frost, the birds passed south to the Mediterranean shores; but ducks and teal took their places on the brooks and river-sides, and gave plentiful sport. A wild cat was sprung during one of these wintry excursions, and it is matter of much interest to an English naturalist to read of its agility and mode of life, as the true wild-cat is now all but extinct in England, and only lingers in certain favoured spots of Scotland.

Another pleasant chapter describes the shooting of red-legged partridges in the valley of Locrist. These birds have been introduced into Norfolk, but are not held there in much estimation, owing to their habit of running instead of rising before the sportsman. It has been found, too, that they cause the common gray partridge to disappear from the locality. The sportsmen distributed themselves on each side of the valley, to intercept the birds as they flew from one side to the other, and proceeded to beat with the pointers of the country. They are powerful dogs, and will face a gorse-cover, and even retrieve; it is the fashion to cut their tails short. The red-legs were flushed while feeding amongst the broom, heather, brnshwood, and patches of buckwheat and oat-stubble. The poachers of the country on such an occasion are wont to scout on the edge of the *remise*, or cover, to which the birds fly on being disturbed, and generally manage to secure full bags by this strategy.

In addition to descriptions of various wild sports, our author gives us miscellaneous items, frequently of an amusing, as well as of an instructive nature. Thus, an interesting account is given of the State aquarium at Concarneau, the gray mullet in which are so tame that they come to the director in order to be fed. This establishment is maintained for the purpose of studying the habits of fish, with a view to their better culture and propagation in a state of nature; an aim essentially different from that of the aquaria with which late years have familiarised us. The archaeological remains of Carnac and Hellu also come in for a notice; and an interesting account is given of the wrestling-matches of Pleyben, to which the Bretons, like their Cornish relatives, are devoted. The first prize, which somewhat revives classical recollections, consisted of a big fluffy hat. After the due number of 'falls,' the national bagpipes struck up, and the peasantry eagerly joined in a marvellous dance, called the *Jabadan*. This is the Breton fandango, and in name as well as nature reminds one of the Spanish *Zapateo* or clog-dance. We incidentally learn that itinerant hair-merchants are wont to attend these Breton gatherings to purchase tresses from the country girls. Long experience shews them that despatch is needed, so three snips for the most part are all that is necessary in their dexterous hands to deprive a maid of her flowing hair, almost before she has had a moment to repent her bargain.

But we must break off our notice of this fascinating book, which treats of a land tolerably near, but of manners and customs remotely distant from ours. Its pleasant style never flags; incident succeeds anecdote, description follows travel-talk of horses, hounds, and silvan-craft; nor would it be right to omit mention of the spirited etchings where-with Colonel Crealocke has adorned the text. By the aid of his frontispiece and the author's graphic narration, we almost seem to have assisted person-

ally at a wolf-hunt. An amusing termination to these sporting days is found in joining a town *chasse*, when a 'scratch pack' of twenty dogs, and a large 'following' of peasants and *ouvriers*, under the guidance of a carpenter, all armed with fowling-pieces, at a distance of twenty paces between themselves, swept the country in a line of some four hundred yards, remorselessly shooting down every live bird and beast they could arouse. Our author made trial both of its pleasures and its dangers, for a careless fellow blazed at a rabbit which ran near the writer's legs, and succeeded in putting two slugs through his leather leggings, at the same time that he killed the rabbit. The carpenter commandant rated the fellow soundly for his carelessness, and even excluded him for the future from the *chasse*, assigning for reason, with becoming gravity, that 'he was a dangerous character, and would one day shoot one of his hounds.'

THE LIGHTHOUSE OF THE GANNETS.

IN FOUR CHAPTERS. CHAPTER III.—A SAIL!

'Is he mad?' whispered Mr Damer in the ear of the old boatman Mawle; but low as his tone was, Willis overheard the question, and took upon himself to reply to it.

'No, sir; I am sound enough so far as my wits go,' he answered civilly, but sadly; 'though many a better head than mine has been turned by work such as mine. Few lighthouse keepers can hold out, nerve and brain, so long as I've done. You don't know what it is to have your ears filled, through daylight and darkness, with the roar of the enemy so near to one, to see no prospect but the waste of gray waters hemming in one's solitary dwelling. All this, you'll say, is wide of the mark. I only mention it to shew you that a man's intellect may remain unimpaired, though his manner, from lonely living, may come to be odd and strange. Anyhow, the lighthouse is going to bits, as an unseaworthy ship might do. The boy Bill knows it as well as I do.'

'I'm afraid Mr Willis speaks gospel truth,' said the master of the late *Delight*, whose deep voice now made itself heard above the confused utterances of the rest of the party. 'Tis common talk among us blue-jackets how the building here on the Gannets stands sorely in need of repairs, and the wonder is, rather, it has kept its own so long. It's an old lighthouse this, and was ill-built, with iron bolts where copper should have been, and the timber of the foundations, that were sound heart-of-oak piles in their day, have rotted with age and damp. Two year ago the government surveyor came to see it, and he promised as repairs should be done. Never a stick nor a clamp has been changed, to my knowledge.—You, squire, as has been a parliament man, understands how what oughter be done don't get done.'

Mr Damer notified a hurried assent. His was a difficult task. Mr Lee, a man of average sense, but weak in nerve and muscle, was unfit to calm, in so awful a situation, the fears of his half-hysterical wife; while Rosa, braver than her

mother, a noble girl, who only lacked the stimulus of love to enable her to confront peril boldly at the loved one's side, did not love him—Mr Damer of Damer Park. It was hard to have to calm the nervous anxiety of the one, the natural timidity of the other, while all the time the instinct which prompts all of us to hold on to life until the last, was asserting itself in Mr Damer's breast.

The men, gathered under that menaced roof, acquitted themselves fairly well so far as manliness went. Mawle, an old man, with two daughters, and with grandchildren that were used to prattle and play about on the beach within reach of the brown caressing hand of the aged sea-king, seemed to think a good deal more of the dear faces that he might never see again, than of his own fate. The young sailors, like the junior lighthouse keeper, gave up hope with a sigh or two, but with marvelously few words. Mr Damer seemed courageous and unselfish; Mr Lee, quiet and composed; while Rosa appeared only heedful of her mother's terror.

'Can we do anything, Willis,' said Mr Damer, 'to stave off the breaking up of the lighthouse? Here we are, half-a-dozen strong men, and sailors too—have the knack of engineering; and perhaps'—

'Useless, sir, if we were sixty, instead of six,' returned the lighthouse keeper, after a moment's consideration. 'We want a derrick here; and boring-tools, and braziers, and the calmest of weather, that iron and copper, and lead and timber, may get a clutch of the slippery stone below. Why, sir, when first I was sent here, the Gannet's Brood, as they call the smaller rocks, were twice as many, and twice as big, and they made a screen for the lighthouse, on which now the whole strength of the Atlantic spends itself.'

'That's true,' rejoined Mawle. 'When I was a boy, we counted the Gannets as twenty-nine; they're eleven now. Mr Willis, there, hasn't allays earned his living by the sea, as you may tell by his speech; but he has heard the thunder of the salt water when most of us were well asleep.'

All this time the mighty sea was dealing stroke after stroke upon the more exposed flank of the lighthouse, that trembled beneath the blows, as if it were a birch-tree quivering under the fierce impact of a fitful gale. The wind howled around the wooden turret wherein were the lamps, soon to be lighted. The very planking of the floor shook ominously beneath the tread of those whose tenure of life seemed to depend on the endurance of the rusted fastenings that alone held up the entire structure.

'If I'm a judge of weather,' said one of the *Delight's* crew, a sallow, grizzled, little sailor, 'it's getting worse, not better. The wind's not stronger, but the sea is, and them big Atlantic waves are the awkwardest, short of Cape Horn, that ever Jack Judkins had to deal with. I told you, skipper, that I smelt mischief, before we sailed to-day, but you wouldn't heed a broken-down, long-voyage man like me. We'll be'—

The rest of Mr John Judkins' discourse was cut short. There was a crash of breaking woodwork below, and a smashing of glass, and a gurgling of angry water, and then a piercing shriek of female voices, as through a breach in the wall the waves were now gaining access. It was plain

that the rocking, trembling structure was no longer tenable.

'I've looked for this,' exclaimed Willis, who seemed to gain energy from the very desperation of the position, 'this many a day. To stop here is to perish, like a rat in a hole. Our only place of refuge is the Gannet's Back, and our only hope that some of us may be found living when, after the storm is spent, a fishing lugger may pass within hail. I'll shew you, at any rate, how to stave off death for a while. Follow quick.'

The Gannet's Back, so called, was a long and sharp ridge of black wave-worn rock, which, as the highest spot of ground to be found within the limits of the islet, afforded the best chance of at least temporary safety to those driven forth from the lighthouse, now tottering to its fall. It was, however, difficult to maintain a firm foothold on the narrow spine of crumbling rock, over the lower portion of which the surf broke heavily; while not a part of it was high enough above the surface of the water to be free from the spray, which mingled with the now fast-falling rain. While still the lightning flashed, and the thunder bellowed in the distance, as the storm rolled on to the eastward.

'The ladies will be miserably ill off, I fear, in this chilly place, should we have to remain here throughout the night,' said Mr Damer, as he and Mawle sped back to the lighthouse to bring away such rugs and waterproofs as could be hastily laid hands on, so as to afford Mrs Lee and her daughter some protection.

'Ay, ay, poor things,' answered the old boatman, 'taint likely they'll last it out so long as the likes of we.—But come, squire, you must be quick, or— Hold back, sir, for your life! There it goes!'

And indeed, before the words were well uttered, the lighthouse toppled over from its perch on the rocky bank, and fell prone into the sea, sending aloft a mass of white water, that splashed and spouted far into the air, and flooded for the moment even the highest escarpments of the stony islet. Then the wild waves, as though exulting at the overthrow of a vanquished enemy, leaped up to tear and tatter the wreck of the building, rending it plank from plank, until it was converted into a mere floating heap of disjointed timbers. When Mr Damer and Mawle the boatman contrived to crawl back to their companions in misfortune, they had but little that was comforting to impart or to receive. The general dejection seemed the deeper since the destruction of the lighthouse, for man never feels his own weakness so fully face to face with the untamed might of Nature, as when he witnesses the annihilation of the strongest of his vaunted works by her terrible forces.

'To-morrow, perhaps—not a chance of it earlier,' was old Mawle's reply to the reiterated questions of the gentlemen of the party as to the probability that relief would reach them.

'But the ladies?'

To this nothing could be answered. A good-natured sailor had laid a rough watchcoat—the only wrap of any kind that had been brought from the lighthouse—over Miss Lee and her half-fainting mother, but there seemed little prospect that the weaker members of the party would survive many hours of such exposure to the fury of the weather in that bleak and desolate spot, as to all appearance awaited them.

'No, no,' said Willis, the lighthouse keeper, in answer to another inquiry; 'the tide won't harm us here. It makes very little perceptible difference so far out to sea. It's the sailor's tide we feel here, not the landsman's, and only at full spring-flood does the water creep up to the Gannet's Back. There's an awful sea on, though.'

And as he spoke, Rosa could not repress a shriek, for a giant wave, bursting over the rocky barrier, almost reached the shivering forms of those who were clinging to the ridge of rock, and sent a cloud of foam clean over the Gannet's Back. At that moment the sailor who had announced himself as Jack Judkins set up the welcome cry: 'A sail! a sail!' and hope sprang up again in every heart.

'You can make the strange sail out better than I,' said Mr Damer, resigning his pocket field-glass to the more practised boatman at his side.

'A schooner—a yacht, by her fine lines and trim spars, and beating up bravely towards us,' cried the late owner of the *Delight*. 'Why, she's the *Titania*, out of Ravenscombe harbour. I'm afraid, though, such a gingerbread thing as a yacht, with a Jemmy Jessamy young gentleman like Mr Lawless to command her, won't come within grappling distance of the Gannets on such a day as this.'

'There's a shift in the wind, just a point, but it helps her,' muttered Judkins, breathlessly watching every manœuvre of the yacht; 'she's behaving beautifully, answers to her helm as if she were alive.'

'That's no dandy landsman that's handling her now,' exclaimed the lighthouse keeper, shading his eyes with his hand as he looked eagerly at the approaching vessel; 'a thorough sailor he must be that's in command, and a gallant one too, to risk life and limb so nobly to save strangers.'

It was indeed a sight well worth the seeing, that which was presented by the struggling schooner as she fought her way, inch by inch, yard by yard, against the raging waves that boiled around her, as though they knew her mission was to rescue the human victims of their relentless anger, and strove to involve the *Titania* in the common doom. Reeling along, her deck swept by the surge, her bows hidden ever and anon by a cataract of glistening spray, the holiday vessel, under shortened sail, did brave battle with the tempest. Now and again the schooner heeled over so fearfully that her bright copper glanced through the driving scud, and often it seemed as though the strain was greater than masts and rigging could endure; but, handled with consummate skill and daring, she gained at each successive tack, and slowly neared the Gannets.

'If the sticks don't get fairly blown out of her,' growled Willis, as he surveyed the yacht through the glass, 'she'll range up to the leeward yet, but the sea swings her and buffets her as if she were a cork. Round she goes again, true as steel. A good boat; and a brave seaman he must be that's giving orders aboard.'

CHAPTER IV.—ALL'S WELL THAT ENDS WELL.

'Too near! too near! she'll go against the rock. No; she has rounded it; but it was touch-and-go work of it, for the lives of all on board the schooner. Grand steering, though!' Such was old

Mawle's professional comment, as the *Titania*, by what seemed a marvellous combination of skill and good fortune, avoided a pointed, half-sunken rock that jutted out into the sea, as though to defend the approach to the Great Gannet, and lay to in the comparatively untroubled water to the leeward. Much time had undoubtedly been saved by this apparently hazardous exploit, and now the yacht was so near that a ringing cheer from her crew was answered by a feebler shout from the sailors on the rocky islet.

Though much had been done, much still remained to do. The yacht was rolling about in the rough sea, perilously near the rugged shore, while around her floated beams, joists, and lighter fragments of woodwork, part of the wreck of the lighthouse, and whirling about with a violence that would of itself have threatened a boat with destruction, even if it had been prudent to lower a boat into a surf such as that which broke upon the black rocks. The first attempt to establish a communication with the shore resulted in failure. Repeated casts with a grapnel were made, but in all instances the barbed iron fell short of the mark, nor could the schooner, without a rashness akin to suicidal folly, be brought closer in. A kedge had been hastily let go, and there she rode, amid the tumbling water, but it seemed scarcely possible that even the hardiest swimmer could make his way through the breakers. Whiz! Off flashed a rocket from the yacht's deck, and, adroitly aimed, it hissed and crackled its curved path above the Gannet's Back, some yards of the light line attached to it dropping within reach of the belated group. With a cheer they hauled in the line, and the small hawser that was made fast to it, and almost instantly an active form was seen to spring over the *Titania*'s side, and boldly dash into the surf, holding by the tough rope, and struggling manfully onwards until, breathless and dripping, he swung himself ashore. Another volunteer, and yet another, succeeded to this, the first adventurer, who made but one bound to the ledge whereon Rosa and her mother were crouching for shelter. Miss Lee's eyes met those of Lieutenant Gordon, and as he bent to raise her, the shock of this joyful surprise overcame her reserve, and with a low cry of 'Malcolm!' she fainted in his arms. He lifted her slender form as easily as though she had been a child, and directing the sailors who followed him to take charge of Mrs Lee, he again grasped the hawser, and set forth on the return trip to the yacht, tenderly clasping his precious burden to his breast.

It was no trifling task, that of regaining the schooner under such circumstances, and more than once the young lieutenant felt as though he should be compelled to relinquish his grip of the saving rope, or as if Rosa would be torn from him by the rush of an angry wave; but he was strong and agile, and, with Miss Lee in his arms, at length found himself on the deck of the yacht; while, by the exertions of the crew, in little more than half an hour every living soul had been hauled safely on board the *Titania*. Then the capstan was manned, the kedge was hauled in, and the yacht, under close-reefed canvas, made for the open sea. As she emerged from the broken water, that seethed, as in a witches' caldron, in

the narrow channel between the Great Gannet and the congeries of rocks that bore locally the name of the Brood, a hearty hurrah from the sailors on board the vessel greeted the young naval officer, who stood beside the helmsman, directing the schooner's course.

'No, no; I go for nothing in the job,' said blunt-spoken Mr Dawson, sailing-master of Jack Lawless's fine yacht, in answer to some words from Mr Lee. 'It's the lieutenant to whom you owe your lives, since, under God's mercy, his skill and courage have brought you off unhurt. I never thought—an old Channel groper like me—to learn a lesson in my own trade on board my own craft; but I've done it to-day. 'Taint every merchant skipper, nor yet every white lappel of the royal navy, could have brought the schooner and you through the queer scrape we were in.'

It was not until the *Titania* had run for some miles after leaving the Gannets that the weather shewed manifest signs, discernible even by the unpractised eye of a landsman, of the gradual cessation of the fierce but short-lived tempest. The sea still ran very high, since the great glassy waves of the Atlantic came rolling in, one after another, an endless succession of mountain billows; but the wind was certainly abating, and as the schooner had suffered little damage, there seemed every probability of making some port on the Cornish coast before sunset. The yacht was still under Lieutenant Gordon's command, although for the time being danger appeared to be at an end.

'I fear'—it was thus that, with a quivering lip, Mr Damer addressed himself to Miss Lee, when, after the first excitement of the rescue had passed away, he found an opportunity of approaching her—'I fear—I see—that my hopes are false ones, and my day-dream over. I had trusted one day to call you my wife. I see now that such happiness is not for me.'

'Do not blame me!' said Rosa piteously; but Mr Damer's gentle, patient smile reassured her.

'I have not come to reproach. I have no such right,' he said, 'even were such my thought. I can well understand the reasons which prompt your—preference for another, and I have simply come to assure you that no suit of mine shall ever again come between you and the absolute liberty of your choice.'

With a bright smile, that shone through the tears that fell fast from her eyes, Rosa, half timidly, held out her hand to him.

'Oh, be generous!' she said; 'tell this to my parents—to my mother. They will then no longer refuse their consent to— Ah! pardon me, Mr Damer; I ought not to ask this of you. I was thoughtless, selfish, and—'

'No, no,' rejoined Mr Damer, in a voice that he vainly strove to render calm. 'You are right, Miss Lee; nor will I play an ignoble part towards her whom I have loved, or towards the gallant gentleman, to whom I, in common with all who have been rescued from imminent peril this day, owe a deep debt of gratitude. I will speak with Mrs Lee at once.'

Mr Damer kept his word. He did speak with Mrs Lee, so soon as that lady was sufficiently composed to hear what he had to say, and also with Mr Lee; and the result of the conversation was that Malcolm Gordon was summoned from his post

on deck, and, to his surprise, on entering the cabin of the yacht, Rosa's mother placed his hand in that of Rosa. Mr Damer, as might have been expected, was not present, and the betrothal of these two young lovers, whose love was now for the first time sanctioned, was effected with very few words on the part of either. Mr Lee, reddening and stammering, as an honest Englishman who is forced to own himself in the wrong is apt to do, said something that was meant as an awkward apology for his previous rejection of the young lieutenant's suit for his daughter's hand, and seemed inexpressibly relieved when Gordon cut it short by heartily shaking his own.

'You were quite right, as the world goes,' said Malcolm frankly.

'And I am proud now to hail so good a fellow as my son-in-law that is to be,' rejoined Rosa's father.

The weather gradually improved, and before nightfall the *Titania* succeeded in making Ravenscombe harbour, where the whole of her passengers were set safely on shore, amid the applause and outspoken congratulations of the crowd that had collected on the little pier; for, since the coming on of the tempest, the *Delight* and those on board of her had been given up for lost. The Lees and Mr Damer took a cordial farewell of Willis, the late keeper of the vanished lighthouse of the Gannets, who went to the coastguard station to make his formal report of the disaster; while the lad, like the crew and owner of the *Delight*, met with a clamorous welcome from the families and comrades who had hastened down to the shore, on receiving the tidings of their escape.

Foremost among those who offered their congratulations on the happy ending to an event which had so nearly proved tragical, was the proprietor of the *Titania*. 'Thank God, I see you safe on *terra firma* again,' he said, with more earnestness than was usual with him; 'and thankful too am I that my yacht, which to me was no better than a toy, should have rendered service in the doing of a good deed.'

Meanwhile, Mr Damer was taking leave of his late companions in peril.

'We are to be friends—always,' said Rosa, as he held her hand for a moment in his.

'Always, I trust,' he answered, smiling as he turned away; and Rosa never perhaps quite knew what a pang this exhibition of unselfish stoicism had cost her discarded admirer.

Three months later, Rosa and Malcolm were married; and before the new year began, a great change in the prospects of the latter was effected, since, his elder brother Archibald having been accidentally killed by the discharge of a gun, Lieutenant Gordon and his bride yielded to the wish of the lonely old Laird of Glendarroch that they should take up their residence beneath the roof of the mansion which will one day belong to Malcolm, by right of inheritance. Mr Damer, after a while, learned to console himself for his disappointment, since there has for years past been a pretty Mrs Damer, of Damer Park; and both she and her husband are reckoned as among the truest friends of the Gordons of Glendarroch.

OF

POPULAR

LITERATURE, SCIENCE, AND ART.

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 630.

SATURDAY, JANUARY 22, 1876.

PRICE 1½d.

THE BOOK OF KELLS.

PERHAPS only a very few persons are aware that much has lately been done at the national expense to produce exact fac-similes of ancient manuscripts illustrative of the history, manners, and feelings of long-past times. It is a noble undertaking, worthy of a great and wealthy country. What we propose to do is to give our readers an idea of what has been done for this species of literary revival in Ireland, through the agency of the Right Honourable Edward Sullivan, Master of the Rolls, and J. T. Gilbert, Secretary of the Public Record Office, who have selected and edited the National Manuscripts to be reproduced, and by Major-general Sir Henry James, who has photozincographed the fac-similes, by command of Her Majesty.

The First Part of this remarkable collection of fac-similes, which has been lately issued, is a large folio volume, to be procured at the offices for the sale of Ordnance Survey Publications. We have seldom or never seen any work of the kind so beautifully executed, or more calculated to inspire respect for the taste and perseverance of the priestly penmen who lived eight to thirteen hundred years ago. Nor do we less admire the artistic ability which gives us specimens, in all their original beauty, of what these ancient penmen produced. The manuscripts are in various languages, such as Latin and Celtic, and are in the custody of public institutions or of private individuals. Some are of a quarto size, others of smaller dimensions. Though on the whole well preserved, some are defaced and tattered. But in whatever condition they happen to be, they are represented with singular fidelity, the very marks of damp or injury being strictly shewn. All that is attempted has been to give specimens of pages or of ornamental letters; these being pictured on blank leaves of the volume. What has been done shews what the manuscripts are like, and excites a fervent wish to see more of the same description. Much merit is due to the decipherers for making us understand the nature of

the manuscripts. To the ordinary world, the writing, however beautifully executed, is for the most part unintelligible. The decipherers, with enormous pains and erudition, have given the language in modern typography opposite each page represented, so that where the language is Latin, there is little difficulty in knowing what are the subjects of these ancient books. In a few instances, translations into English are given. All the manuscripts are, we need hardly say, of a pious nature, such as Prayers, Psalters, and the Gospels, less or more complete. We shall run over the names and history of what may be called the principal manuscripts.

An ancient Latin version of the Gospels. Portions have been lost, and the remainder has suffered much from decay. It is preserved in a case in Trinity College, Dublin. The sequence of the Evangelists is Matthew, John, Luke, Mark, corresponding with that in the Græco-Latin Codex, assigned to the early part of the sixth century, and presented to the University of Cambridge by Theodore Beza. The manuscript is believed to have been written in the sixth or seventh century.

The Latin Psalter styled Cathach. It is a fragment. The manuscript, which is ascribed to the hand of St Columba, is preserved in an antique metal casket, known by the Irish term Cathach, or the 'Battler.' The bearing of the Cathach on the breast of a sinless cleric thrice round the troops of the O'Donnells, before battle, would, it is said, insure victory to them in any just cause. The Psalter consists of fifty-eight leaves, considerably damaged. After passing through various vicissitudes, it has, along with its casket, been deposited in the Museum of the Royal Irish Academy, Dublin, by its owner, Sir Richard O'Donnell, Baronet, by whose permission the fac-similes were effected.

We now come to a more important work, the Book of Durrow, an ornamented copy of the four Gospels according to the Latin Vulgate. It is ascribed to St Columba. The writing is across the page, in single column. It is embellished with evangelistic symbols within borders, and pages of

coloured, spiral, and interlaced ornamentation. Some of the capital letters are in the Greek character. The book acquired its name from having belonged to the monastery founded by Columba, about the year 553, at Durrow, in the central part of Ireland. Some of the leaves are water-stained, but the greater part of this beautiful copy of the Gospels, though thirteen hundred years old, is in excellent preservation. On its cover is a silver cross, which a learned scholar states to have been executed by order of Flan, king of Ireland in the early years of the tenth century. The Book of Durrow was presented to Trinity College by Vice-chancellor Henry James, who had belonged to Cromwell's army in Ireland, and became Bishop of Meath in 1661.

The grandest of all these ancient manuscripts has now to be noticed. The Book of Kells, as it is styled, is considered to be 'the chief palaeographic and artistic monument which has descended to us from the ages in which Ireland, under the name of "Scotia," was renowned for her schools, whence religion and letters were carried to various parts of Europe.' It is a copy of the Gospels, chiefly in the Latin Vulgate, but with many peculiar readings. Unfortunately, it is imperfect. The surviving portion consists of three hundred and thirty-nine numbered leaves, of a large size, thirteen inches long by nine inches broad. It received its present name from having belonged to the Columban monastery of Kells, in Meath. There is a reasonable conjecture that this manuscript, matchless for its elaborate beauty, is 'the volume eulogised in the twelfth century by Giraldus Cambrensis as the marvellous book exhibited to him at Kildare, and popularly believed to have been executed under the direction of an angel.'

The Book of Kells, like the Book of Durrow, is ascribed to St Columba; but considering the prodigious missionary and other labours of that famed individual, we cannot put any confidence in the tradition. Either of these books must have been pretty nearly the work of a life-time. What toil, what patience, what ingenious skill were required to write these books with a pen, letter by letter! What artistic taste in designing the ornamental tracery, which gracefully twists and twines in endless convolutions! What precision required in measuring with squares and compasses, so as to produce mathematical accuracy! And what a knowledge of art in applying the appropriate contrast and harmony of colours—red, blue, green, yellow, and purple! Obviously, each book must have been the production of not one but many artists, all working to each other's hand; and such we know to have been the case in the Scriptoria or writing-rooms of the Benedictines and other monastics.

St Columba, called also St Colum-Cille and St Colm, under whose direction the Book of Kells was probably executed, was a native of Ireland, where he was born in the year 521. Bred for the

church, he commenced his extraordinary missionary career about 543, when he went to the Western Isles of Scotland, and founded the monastery of Iona. Thence, he proceeded with his disciples to christianise the northern part of Scotland, the southern division of the country having already been brought under the light of the Gospel by St Ninian. From the time he landed in the Western Isles, St Columba was so continually employed in his missionary labours, until his decease in the year 597, that no one can conceive how he could find time to produce a hundredth part of the various manuscripts generally imputed to him, and which he presented to the numerous churches and religious houses that he established. It seems not unlikely that, besides directing his properly qualified subordinates to execute copies on vellum of the Gospels and Psalms, he adhibited his signature to some of the more important manuscripts, either to make them acceptable, or because, from a sentiment of pious veneration, he was requested to give them this envied stamp of authenticity.

Our narrative takes us for a moment to St Patrick, who was born about the year 387—whether in Scotland or in some continental country, is undetermined. After studying for the church in France, he arrived as a missionary in Ireland in 432. His efforts in disseminating a knowledge of the Gospel were eminently successful. According to the accounts of his Irish biographers, he founded three hundred and sixty-five churches, and baptised with his own hand twelve thousand persons. He died at an extremely old age, prior to the year 500. He had, therefore, disappeared fully twenty-one years before the birth of St Columba, who could only know him by tradition. It is certain that Columba emulated the great Irish apostle in his missionary labours, and held his memory in extreme veneration. Columba did not confine his ministrations and example to Scotland, but extended them to Ireland, and there he founded the monastery of Kells, with which and Iona there sprung up a close and friendly intercourse. When Iona became unsafe on account of the ravages of the Norsemen, between the years 802 and 815, the members of the Columban community who had escaped destruction transferred themselves with their sacred vessels and books to Kells, at which was constructed a 'new city of Colum-Cille,' apparently for their accommodation. There must have ensued an interfusion of the two communities, for the abbot of Kells was long known as the legitimate successor of St Columba. There is another interesting fact. The name of Columba, in connection with that of Patrick, is still legible on one of the ancient stone crosses surviving at Kells. Speaking of these antique crosses, they resemble the finely sculptured crosses of Iona, where two still remain as memorials of the past. All these crosses, Scotch or Irish, bear carved ornamentation in harmony with the ornamented pages of the ancient Irish manuscripts.

The removal of the Columban community to Kells, at the beginning of the ninth century, naturally raises doubts concerning the origin of the ancient manuscripts said to have been found at Kells; for some of them, the Book of Kells included, may possibly have belonged at one time to the community of Iona. At anyrate, the Book of Kells was one of the treasures of the church whose name it bears until the time of Archbishop Usher, who was Bishop of Meath from 1621 to 1624. After his death, when his library was granted by Charles II. to the University of Dublin, this precious volume was found among his books, and has ever since remained in the safe custody of its present possessors, who, on account of its containing a Royal Charter of one of the kings of Ireland, deemed it not unfitting to allow Queen Victoria and her Royal Consort to inscribe their names in the volume on the occasion of their visit to Ireland. The Book was long ago enshrined in a golden *cumdach*, or cover, and narrowly escaped destruction in the year 1006, when it was sacrilegiously stolen in the night out of the sacristy of the church of Kells. It was nearly three months afterwards found with its golden cover off, and a sod over it. At present, it is carefully preserved in Trinity College; the only thing to be seriously regretted is, that it has been somewhat mutilated by an attempt at modern binding.

By whomsoever the Book of Kells was executed, it bears the unmistakable mark of great antiquity. In viewing it, we are to carry our mind back to a time eleven hundred years before the invention of printing, when the only books were written on vellum, and read by priests to assembled devotees. Just think of the Book of Durrow or the Book of Kells being read and expounded to an assembly of people wholly ignorant of letters, and who, for the first time, heard of Christianity! We are reminded of such pioneers of the Gospel as Moffat and Livingstone, but with a difference. These intrepid men, like all modern missionaries, carried with them handy copies of the Bible in plain typography. The ancient missionaries in the Columban era had no such reliance. The records of the religion they were to teach were scraps written on leaves of vellum, and which, though meagre, were executed in such a style of splendour as must have appeared marvellous to the beholders. How an illiterate pagan in the seventh century must have stared on getting a glimpse of the pictorial pages of the Book of Kells, with their intricate representations in magnificent colouring of human figures, of beasts, birds, and scriptural scenes, calculated to soften and win the most obdurate heart! It is by calling up such imagery, that we obtain a correct idea of the value of these ancient manuscripts. We have to view them as the original instruments of that civilisation that now pervades the British Islands, and from which no end of cultured usages have, in process of time, radiated over the globe. Considering what a

groundwork of Christianity was laid by the penmen who executed the Book of Durrow, the Book of Kells, the Book of Dimma, the Book of Armagh, and various other Books which could be specified, we cannot help thinking that these writers have never had justice done to them in the way of public acknowledgment. The truth is, that, under Providence, but for their indefatigable and pious labours, the very Scriptures might have been lost amidst the savagery and tumults of the middle ages.

Passing from the sentimental view of the subject, we may be excused for coming to what is practical and artistic. Of the Book of Kells, Professor J. O. Westwood of Oxford has remarked, that it is ' unquestionably the most elaborately executed manuscript of so early a date now in existence; far excelling in the gigantic size of the letters at the commencement of each Gospel, the excessive minuteness of the ornamental details crowded into whole pages, the number of the very peculiar decorations, the fineness of the writing, and the endless variety of its initial capital letters, the famous Gospels of Lindisfarne in the Cottonian Library. But this manuscript is still more valuable on account of the various pictorial representations of different scenes in the life of our Saviour, delineated in the genuine Irish style.' The reproduction of the entire manuscript as it now exists, would doubtless have been a work of considerable labour and cost; yet, were it possible, the dissemination of the work in a complete state, to the extent merely of putting it within the reach of biblical scholars, would be of invaluable service. Where the manuscript happens to be defective, portions could probably be supplied from some of the other ancient manuscripts, by which means an entire copy of the Gospels of the sixth century, in fac-simile, would be obtained. Viewed as a precious gift to the modern world, this is a matter which may be commended to the notice of beneficent millionaires. In the interests of art alone, the Book of Kells is eminently suggestive. We wish it were in our power to offer a representation of the pages of this glorious old manuscript. The lines of words across the page are large, and susceptible of being read by aged priests before the invention of spectacles. At spaces between the sentences or at the end of the lines, figures of animals are introduced in a curiously fantastic fashion, all coloured to the life. The most conspicuous embellishments, however, are the initial letters of the chapters. They, too, are most fantastic, and shine in a prodigality of colours, the greens and yellows being as bright as if laid on with a brush only yesterday. Specimens of the Gospels or Book of MacRegol, a work of the ninth century, shew also some elaborate drawing and colouring. The same thing may be said of a Book of Hymns in Irish, tenth to the twelfth century—one of the hymns eulogistic of St Patrick being translated, and very much in the style of Ossian. Though these manuscripts are beautiful, they fall short in point of elegance to the Book of Kells.

What, however, about the means by which these and many other old manuscripts have been successfully copied and presented to the eye, to all appearance no way differing from the original? How were the fac-similes produced? To answer

this very reasonable question, we descend to technicalities concerning the art of printing, which has latterly been extending into new varieties. First, we have lithography, or printing from inscriptions or figures made on a calcareous level stone. When the design is complete, the stone is sponged with water, which takes to the clear portion of the stone, and runs off the lines forming the design. The stone, after being freed from surplus water, is inked by a roller passed over it, the ink adhering only to the design; an impression on paper is then effected. The next novelty in printing is photography, in which, by the aid of a camera and other appliances, a negative is prepared by the sunlight, from which likenesses are produced. Next, comes the art of Photozincography, in which the above two processes may be said to be combined. Instead of a stone, there is employed a zinc-plate, which has been coated with a solution of gelatine mixed with bichromate of potash, and dried. A plate so prepared is sensitive to the action of light, and upon placing a negative in juxtaposition with it, an image will be the result. The plate is placed in cold water, and treated very much in the manner of lithography, the ink adhering only where the image is represented. By some additional and most ingenious inventions, reversed negatives may be obtained. The peculiar value of this kind of printing is, that you are able to secure fac-similes of books, writings, or pictures, with all the fidelity of a photograph. A familiar example is offered in reproduced first editions of the works of old authors, shewing the exact typography of the original. By this means, copies of books hundreds of years old are now manufactured—the first edition of Shakspeare, for instance—without the necessity of making or setting up old-fashioned types. Surely, that is a great triumph of art. We have called it Photozincography, but it is perhaps better known as Autotypy—the word signifying self-printing. There is now a large establishment in London for producing autotypic copies of works.

Greatest triumph of all is the reproduction of ancient manuscripts, such as we have been speaking of, in which divers colours are introduced. In the Book of Kells, as already mentioned, there occur letters and ornamental figures, in which are employed five colours, besides black in the substance of the text. Some pages are quite a blaze of colours, intermingled in a way the most fanciful, yet without any confusion. Sir Henry James says that 'the production of fac-similes of such highly ornamented work has tested the skill of the draughtsmen and printers of the Department, the selection of the various tints of colours requiring great taste and judgment, and the "register" of the plates the greatest nicety and care.' We can testify to the nicety and care required in producing pages with a diversified colouring. For each colour there must be a distinct plate, and the page has to undergo six distinct impressions before it is completed. By the term 'register' is implied the process of causing each colour to fall into its proper place, so as to make up an accurate whole. This has been done effectually, in a way, indeed, beyond all praise. To put it only on an artistic footing, this splendid work cannot fail to offer an incitement to students, who will see from it what was accomplished in circumstances of extreme difficulty, by poor ecclesiastics more than a thousand years ago. To think that a

manuscript copy of the Gospels handed possibly by St Columba in that wild little western island, in the sixth century, should now, after an obscurity of thirteen hundred years, be prized as a boon by the world of literature and art!

W. C.

FALLEN FORTUNES.

CHAPTER VI.—THE GUIDE RACE.

'SPORTS,' as the celebration of country games is often locally called, are for the most part, in Derbyshire, much the same as they have now become in other places; an excuse for half-a-dozen excursion trains to convey the 'rough' element from the neighbouring towns, and pour it over the peaceful fields—like sewage—only by no means with the same beneficial results; but at Bleabarrow this was not the case.

The prizes offered for competition were too small, and the place itself too remote, to attract much public attention, so that the proceedings were of a 'truly rural' and Arcadian kind. The wrestlers were not attired, as they now often are seen in the heart of Westmoreland, and even Cumberland, in party-coloured tights and fancy jerkins, giving them the air of street acrobats rather than of honest dalesmen; no guerdon was offered for 'the neatest wrestling costume,' but men came in their working-day clothes, and when they stepped into the ring—which was open to 'all comers'—merely threw down their coats and waistcoats, gave their old-fashioned 'turnip' watches to a friend to hold, and kicked off their shoes; then—save that when their names were called, they rubbed their hands in sawdust, so that they should not slip their 'holt'—they were ready for the fray. Of course, there are objections to such sports in any shape, as there are to most things nowadays, thanks to the very superfine tone of our public morality; but if the objectors never amuse themselves in a worse way, they must be what advertising tradesmen term 'a selected lot.' To a mere ordinary mortal, to whom a little physical rivalry seems no more hurtful than any other form of the competition system, they afford an innocent and agreeable spectacle, though the actors are no doubt, as Mrs Campden described them, 'vulgar creatures,' whose 'Sunday best' garments (if they possessed such things at all) are not much better than those that they cast upon the greensward.

They are, after all, fellow-creatures, and it is not uninteresting to watch the play of human nature that accompanies this exhibition of thews and sinews. How anxiously, when a competitor's name is called, he listens for that of his rival, which, like his own, is drawn at a venture from the hat; and how the face lights up if it is a green-hand, and grows serious if it is a veteran whose laurels are not easily won. To the young ones, especially, who have perhaps entered their names for the first time, this is all-important, as their highest ambition is to live into 'the third round,' and their hopes of it can only reasonably lie in being opposed to antagonists of their own calibre. It is very unusual, however, for any one to give up his chance without a contest; a mere strippling will do his best against the last year's 'champion,' and very tenderly the giant will take him up—and in most cases lay him down. But now and then there is

an unexpected resistance; the youthful aspirant is supple and quick; or the slippery grass gives him an advantage, and when all eyes are expecting an easy victory, the giant falls undermost instead of the pigmy. Then a shout of 'Bonny lile one' (for little one) breaks forth from the assemblage, that startles the buzzard on the peaks of Bleabarrow; and sometimes a village maiden (his betrothed) will permit herself (for I have seen her do it) to be so far carried away by a natural enthusiasm as to give the 'lile one' another sort of hug than that which he has just experienced, to the admiration of all beholders.

No one 'bites the dust' in the Homeric way—in fact, there is none to bite, save what the combatants take up in their hands—and the danger, save of a 'ricked' back or a sprained ankle, is slight indeed; but the strain, and the tug, and the tussle—every muscle at its fullest stretch; the legs vibrating, yet stiff as nails; the heart beating at highest pressure; the breath coming in sobs and gasps—are grand to see, and afford the elements of an epic.

The spectacle of it, all entranced young Tony to a degree not attained even by the Christmas pantomimes in London, with which he had been familiar from very early years; for here all was reality; and if there were no splendours in the way of glare and glitter, yet the amphitheatre of sky-piercing crags in which the sports were held had a certain majesty even for his boyish eye, while every point in the proceedings was made plain to him by Jeff (who had them at his fingers' ends), an advantage which in the case of the pantomimes was often denied to him, the explanation thereof being beyond the wit of man. If the two youths were thus rapt up in the combatants of the ring, their elder companion was equally preoccupied in another fashion: his face was indeed fixed upon the wrestlers, but his mind was busy with the contents of those two little notes we have seen him receive that morning; his thoughts, set in motion by the one, crossed the far-stretching seas, and lighted upon a certain valley, shadowed by a mightier hill than any now beheld by his physical eyes, and canopied by a more cloudless sky; the scenery was that of the tropics, but the skilled hand of the mechanic had been at work therein, and had compelled the mountain-stream to do his bidding; there were water-wheeled stamping-mills, such as are used in Cornwall, and all the apparatus employed in mining enterprises; as Holt beheld it, the mill-wheels were still turning, and the huge hammers at work upon the spalling floors, because he was but recalling a picture that had once actually presented itself to his vision; but he knew that no such busy scene was in truth being enacted in that far-off valley, since the Lara Mine had failed to produce its yield of gold. From Brazil his thoughts would leap to Bampton—for there was a connection between those distant spots—where they could make no such picture for him, because he had no personal acquaintance with the place, but wandered vaguely over booths and hustings, and excited mobs of men—such as he had seen elsewhere at election-times.

'The two blows together will have a crushing force,' murmured he, not without a touch of pity; 'but he cannot blame me for either.'

Thus it happened that the first contingent from Riverside Hall had their attention so engrossed

that they never noticed the arrival of the second in the neighbourhood of the ring, where, indeed, as it had seemed that morning, they would have been about as likely to put in an appearance as the bishop of the diocese to be seen at a man-and-dog-fight.

Moreover, there were other carriages present, and some with ladies in them—for the local gentry and their wives were not all so exclusive in their views as Mrs Campden—so that the barouche was no very conspicuous object. Mary and Kate enjoyed exceedingly the notion of watching Jeff, and Tony, and Mr Holt, as they sat, all unconscious of their presence, in the very primitive grand stand—a bank of rough seats with a slanting roof of wood—which was the place of honour; but Jenny's whole attention was directed to the sports. For her (as she lay propped upon soft cushions, yet even then not wholly free from pain), the feats of strength and agility of which she was a witness had a marvellous charm; she was not frightened, as her sister and cousin were, at the crisis of each combat, when one put out his strength to overcome the other, and to bear him to the earth; and when the victory was achieved, and Kate would cry: 'Poor fellow! how hard he struggled,' in pity for the vanquished, Jenny's tiny palms were doing their best to swell the triumph of the conqueror.

As for Uncle George, his principal occupation was to consult his watch and calculate how far by this time his wife had probably progressed upon her 'calls,' and how much, therefore, of margin there was left for them to go home in, and still anticipate her return. Presently, a short stout gentleman rode up to the side of the carriage upon a pony, and addressed the party *en bloc*.

'Well, I never! Who *would* have thought of seeing you here? I am sure the sport committee ought to feel flattered. How did you get leave, young ladies?'

'We did not get leave, Dr Curzon,' laughed Mary. 'Mamma had gone out for a drive'—

'Oh, I see; when the cat's away—I mean—ahem!' and the fat little doctor rubbed his nose, which was enormous, and shot out of his bright black eyes a glance of sly significance at Mr Campden.

'Well, I thought there could be no possible harm in bringing the girls,' observed that gentleman apologetically. 'We were only driving by—you see the horses have not even been taken out—and just looked in for a few' (he was going to say 'minutes,' for the fact is the whole speech was but the rehearsal of what he intended to say, when the time arrived, to Mrs Campden herself. He would never have the courage, he felt, now that the effects of the stout and sherry had evaporated from his brain, to own the whole truth).—

But luckily at that moment a great shout arose over some prostrate wrestler, and spared him further humiliation, by attracting his interlocutor's attention.

'Capital fall, by Jove!' cried the doctor; 'and how long it lasted after they got hold! You were timing it, I see.'

'Two hours and a half,' said Mr Campden gravely, 'or perhaps even three.'

'My dear sir, it was not three minutes. What are you thinking of?'

'To be sure, to be sure: I meant three minutes.'

stammered the squire, for such he loved to be called by his Bleabarrow neighbours. 'A very pretty fall indeed.' He had been thinking of the 'margin' so exclusively that he had not even noticed the contest was decided. 'Have you seen our young friends yonder, and Mr Holt?'

'Not I. I am on my rounds, my good sir—professional duty; only, as I was passing by, I thought I'd just look in—like you—upon these wrestling fellows.—I did not expect to find my patient here;' and he turned to Jenny with a look the tenderness of which redeemed his monstrous nose and purple face, and made him almost handsome.

It was a face of great intelligence, notwithstanding its colour—which was solely owing to the inclemencies of the weather, to which his practice exposed him; and among the many advantageous surroundings among which Mr Campden's lines had fallen, that gentleman justly counted it not the least that Dr Curzon was his neighbour. One of the greatest drawbacks of a country life is inaccessibility to medical aid, and also the inferior description of that assistance when it is procured; but in Dr Curzon the tenants of Riverside Hall had a doctor in whom they could have confidence, at their very doors—that is to say, but half-a-dozen miles away by road; and only half that distance, if you crossed the river and climbed the crags, and so dropped down upon the doctor's cottage in Sanbeck Valley.

He was welcome everywhere, not only by the sick-bed, but at the dinner-table of those whose state of health never required his professional presence; and nobody that was not quite a newcomer in the neighbourhood, would have dreamed of saying that it was 'only the doctor,' when his staunch little pony, with its heavy burden, came trotting up their carriage sweep.

'Suppose we say, Uncle George, that you brought me here to see the doctor!' cried Jenny naively—'to meet him by appointment at the sports! When the people are not looking, I will shew him my tongue, and he shall prescribe for me. Then it will be all right, you know, and no story.'

'I don't think that will do,' observed Mr Campden doubtfully. 'No, no; we were just driving out, and looked in; which is, after all, pretty much what happened. There is no occasion to go beyond that. And I really think, my dears, that we had better be turning home.'

'But, Uncle George, there's the Guide Race,' expostulated Jenny; 'you will surely not take us away without having seen that?'

'The Guide Race?' replied Mr Campden mechanically, as he fingered his repentant—'what is that?'

'Why, squire, you ought to know,' put in Dr Curzon: 'it's a thing that we are very proud of in this county, because we flatter ourselves it assimilates us to the mountain districts. It makes old Bleabarrow hold its head up to think that it could possibly require the services of a guide, like Helvellyn or Sca Fell. It is but nine hundred feet, yet it is a stiff climb to that pile of stones yonder; and I doubt whether any of these young fellows will do it in—what shall we say?'

Mr Campden's lips were following the strokes of his repeater, which was talking in his waistcoat pocket in obedience to his pressure on its handle.

'One—two—three—four—aye, and a quarter of an hour,' he answered nervously.

'I'll bet you a shilling they don't do it under the five-and-twenty minutes,' replied the little doctor: 'it has never been done under twenty-five since Longstreet's time, the very neatest cragman of his time; and the heat to-day is something—Why, what's the matter, Miss Kate? They're peeling for the race, that's all; it's not a fight.'

'Yes; but look—look—why, there's Jeff amongst them. Jeff's going to run. How very angry Mrs Campden will be with him!'

'Pooh, pooh!' answered the doctor sharply; 'let her be angry; I mean, she has no right to be anything of the sort. Why, it is very creditable to the young fellow to shew such pluck, and I hope he won't be the last in.'

'O papa!' cried Mary, 'do you see what Geoffrey is doing?'

'I see he's taking off his coat and waistcoat; and I should like to do the same,' said Mr Campden. "'I would take off my flesh, and sit in my bones," as somebody says, "this weather, if the arrangements of nature permitted of it,"'

'But he is going to run, papa.'

'Ah, there, I think, he's a fool, Polly; I wouldn't run.'

'But he is going to join in the Guide Race up the hill—to run for money.'

'He is not, Mary,' cried Kate decisively; 'I am quite certain that Jeff would not do that. The race is open to everybody, and he wishes to try his speed against the others; that's all. You don't suppose he would take any of the prizes, even if he won them, away from these poor people.'

'At all events, I am sure mamma will be exceedingly put out,' said Mary; 'but, of course, if papa has no objection'—

'Eh, ah!' said Mr Campden, who had once more abandoned himself to his apprehensions. 'What is that you are saying about your mother? What the deuce is the matter now?'

'Nothing is the matter, Uncle George, except that I want your arm,' said Jenny gaily. 'I must stand up to see this, and you know I can't do that without your help. There's a dear good uncle; and now don't you move one inch till all is over. There are six of them, and Geoffrey makes the seventh. Now, I call this delightful. There's our dear friend Mr Holt—how I should like to see him run up the crags—and Tony looking at Jeff as though he were a demi-god.'

'And, upon my life, he looks like one,' cried Dr Curzon admiringly.—'Step on the seat, my dear Miss Kitty, and lean on me; the pony will stand quite still, for he has been used to be shot over, though not by such bright eyes as yours.—Now, I call that the model of a young fellow. Who is that he has just given his watch to, to take care of? I hope he's an honest man.'

'My dear Dr Curzon,' said Mary reprovingly, 'that is Mr Holt; a friend of papa's, or rather of Mr Dalton's. Did you not see him at the charades last night?'

'I daresay I might have seen him, Miss Mary, but I did not notice him. The fact is, my attention was wholly monopolised by a couple of pretty housemaids; the fairest, flirtiest, little—Now, don't you push me off the pony.—Mr Campden, I wish you'd speak to these two girls.'

'Speak! you might as well speak to the winds.'

answered the squire, his large arm infolding Jenny's waist with clumsy tenderness. 'Gad! you don't mean to say, doctor, they're going straight up yonder, between those flags? Why, at this distance, it seems almost perpendicular.'

'Seems; nay, it is,' exclaimed the doctor; 'as you shall see. Here's an opera-glass, which I brought for the very purpose; and if Miss Jenny will honour me by using it— We'll call it a stethoscope at home, if you please: the doctor brought his stethoscope to the sports, as agreed upon.—Eh! squire!'

'Yes; it is all very well for old bachelors to joke about other people's wives,' grunted Mr Campden; 'but, by Jove! if you had married Julia, and had taken her barouche to a prize-light—that's what she supposes this sort of thing to be—you'd be as glad of an excuse as I am. Thank goodness, they're starting at last.—You don't care to see more than the start, do you, girls?'

'Uncle George!' cried Jenny earnestly, 'I must see this race out; I never felt so excited in my life.'

'Which must be very bad for you, my dear Jenny.'

'Not a bit of it,' said the doctor; 'it will do her all the good in the world. (Wide Races are recommended by the Faculty for her particular complaint, which, as you see, is mostly "temper.")'

'He's over the wall!' cried Kitty enthusiastically.

'Like a bird,' ejaculated the doctor. 'If it was "Fire," they could not have done it quicker—the whole seven—nor have had much less on them,' added he, *sotto voce*.

'Zounds! but they're close together; you could cover them with a handkerchief!' cried the squire, roused to unwonted interest in the proceedings. 'There, now; they're scattering a bit. Now, the pace begins to tell, and the amateur to succumb to the professional. It's a case of "bellows to mend," I fear, with Master Jeff.'

'Not a bit of it,' answered the doctor indignantly; 'he is only going round the wood, instead of through it, which is the quicker way, although the longer. See! two of them have followed his lead. Jeff has got good wits as well as good wind, let me tell you.'

Kitty's little hand was leaning on the doctor's shoulder, though, up to this point, he had scarcely been aware of it; and now he felt it lean *hard*; she was thanking him by that silent pressure for his defence of her favourite.

The scene had now become very exciting; the seven competitors had already reached the high ground, yet did not in the least relax their speed; a thicket of brushwood immediately intervened, into which four plunged, whose heads and shoulders could be seen making way through it, at a diminished rate; the three others ran round, and were first upon the other side; the young blacksmith of Sanbeck leading; then Jeff; then a certain gamekeeper, said to be able to tire out any sportsman upon moor or fell.

Dr Curzon gave a short biography of each of the seven champions, with whose career he was perfectly familiar. 'I shall be able to certify that Master Jeff's rivals were all eminently respectable members of society,' concluded he slyly in Mr Campden's ear.

'Tush!' said the squire; 'let me enjoy the race.'

When the first climbers got to the steep rocks between the flags, they had become to the naked eye little more than moving specks; and Jenny alone could make them clearly out by help of the glass. 'The blacksmith is still ahead,' said she; 'and Jeff is shoulder to shoulder with the other man. —What did you call him, doctor?'

'Well, I said he was a gamekeeper; between ourselves, Miss Jenny' (this he whispered), 'he's a poacher.'

'He's an uncommonly good climber, at all events,' said Jenny admiringly. 'But Jeff goes like a chamois too.'

'Let me have the glass a moment,' said Kitty softly. Her heart was beating almost as quickly as poor Jeff's, who was doing a very nasty bit of crag-work; it looked as steep as a wall, even to her—to the others, it was like a window-pane with three flies upon it. Not a hundred feet above it was the pile of stones—marking the summit of the hill—which each had to round before beginning the race home. She had gazed upon it from her own room at the Hall a hundred times, but, henceforward, it would have a personal interest for her. What endurance, what fatigue, was he not undergoing! Matched against grown men like these, and all (as she well knew, in spite of Mary's ill-natured remarks) for the honour of the thing; for there *was* honour in it. 'He's down!' exclaimed she eagerly.

'Who's down? Not Jeff!' cried Jenny.

'Jeff? No!' returned Kitty contemptuously; 'it's the blacksmith.'

'Poor fellow!' said Mary; 'he has not hurt himself, I hope.'

'You had better go up and see,' said Jenny rather rudely; 'for my part, I should like them all to slip except Jeff.'

'Oh, so would I,' said Mary, 'so far as that goes.'

'That is the true female view of justice,' chuckled the doctor.—'As for you, Kitty, you would like them all to have apoplectic fits, would you not?'

'No, sir; I should like Jeff to win, but to do it fairly.'

The doctor patted approvingly the hand that rested on his shoulder; forgetting that Kitty had quitted her hold to take possession of the glass.

'You need not squeeze *my* fingers, Dr Curzon,' said Mary, comprehending his error.

'You need not talk about it, my dear, if I did,' answered the doctor imperturbably; he had been nearly half a century in practice as a medical man, and was not easily put out by a mistake.

'He is round the stones,' exclaimed Kitty; 'both of them. Now they are coming to the steep place again—oh, surely they won't run down *that*. I cannot look at them.'

'Give me the glass,' cried Jenny unfortunately. It was popularly understood that she was 'all nerves,' but her hand was steady enough as she brought the instrument to bear upon the returning athletes. 'Jeff and the gamekeeper are far ahead,' said she; 'they are coming like the wind. Well done! Oh, I wish I was a man like you, Uncle George, that I could add, "By Jove!"'

'Why, what's the matter, lass?' asked the squire.

'Jeff has just jumped a boulder like a deer: they are leaping from stone to stone, as the water

comes down the fall in wet weather. I would rather be able to leap like that than anything in the world.'

The doctor pursed his lips, and gave a little sigh, but Jenny neither saw nor heard him.

'If nothing happens, one of these two will win. Think of that, Kitty; Jeff will be second, at all events. O dear, O dear! they cannot stop themselves.'

'Good heavens! what has happened?' cried the squire. Kitty did not speak, but the doctor felt both her hands suddenly clutch his shoulder.

'Why, they'll have to go through the wood, instead of round it.'

'Is that all? You gave me such a turn,' said Mary pettishly.

'That is just what they could not give themselves,' said Kitty: 'they are coming right through the copse, instead of round it.'

'They are wise,' said the doctor; 'they have the ground with them this journey. By Jove! it's a fine race.'

By this time the two leading figures were well in sight, and a mighty cheer burst from the excited throng of spectators, as now the one, and now the other, seemed to have a few feet of vantage. A stone wall lay before them, then a piece of slanting turf, below which was a gully, into which both had descended on their way up—it being of course impossible to clear it from that direction. After that was the 'run in' over a level grass-field, with another stone wall at the finish. Both topped the first wall at the same instant, and then the game-keeper began to lead: it was plain that, though not more agile among the crags, he was a trifle more speedy on the turf than his younger competitor. He would certainly be first at the gap that led down into the gully, and consequently first out of it, after which, barring accidents, the race would be his. The party from the Hall could discern this as clearly as the umpire himself, and gloom fell upon them accordingly.

A roar of exultation suddenly arose.

'Hallo! Jeff's going to jump it,' cried the squire excitedly.

'He's going to try it,' murmured the doctor, mechanically putting his hand to his pocket, to feel if his case of instruments was in its accustomed place. 'He'll break his legs, if not his neck.'

Jeff's plan was indeed a desperate one. Finding himself out-paced by his rival, he had avoided the gap altogether, and was making straight for the gully at its highest point, intending to treat it as a ditch. If he cleared it, he would not only save something of distance, but all the time which the other would consume in descending and ascending. But if he did not clear it, there would be twenty feet of fall upon a stony bottom—the bed, in fact, of a dry torrent.

On he came like a race-horse; there was no time to pull himself together, nor even 'to think about it' (as Jeff himself afterwards allowed, in depreciation of his own feat); and the next instant, that apprehensive 'Ah-h-h-h!' arose from the spectators, such as salutes all 'deeds of derring-do' while in progress, followed instantaneously by the shout which proclaims success. Jeff had alighted, by a supreme effort, at the very verge of the chasm; there was not an inch of margin; but he had done it; and now he was half-way across the field before his rival had emerged from the gully.

'O Jeff, dear Jeff, I never liked you so much before!' cried Jenny, her frail limbs 'all of a tremble,' and the tears running down her cheeks like rain. 'Was it not plucky of him, Kit?'

But Kitty could not have spoken had she been offered, like 'Conversation' Coleridge, half-a-crown for every word. Her face was white, and her eyes seemed to start forth to meet the victorious boy, as he climbed over the last stone wall, not so lightly as he had crossed it last—but yet without signs of positive distress—and ran in to the goal the winner by half-a-dozen seconds.

'Back, back!' cried the doctor, riding in among the people that were pressing around the lad and cheering him vociferously. 'Give him room and air.'

Then presently he reappeared at the side of the barouche.

'The boy is well enough, but awfully "pumped" and exhausted. It is my opinion'—and when the doctor used that form of words, he meant what he said—that he would be none the better for receiving your congratulations just at present, young ladies. He does not even know you're here, you see?'

'Ay, then we had better be off before he finds it out,' put in the squire eagerly. 'Then we shall get nicely home before—that is, in time to receive your mother, Mary.'

DREAMING AND SLEEP-WALKING.

DREAMING is now not such a puzzle as it once was. We know by careful study and experience what it is. No one dreams when he is sound asleep. Dreams take place only during an imperfect or perturbed sleep. The imaginative faculties are less or more awake, and being unchecked by the reflective faculties or judgment, the wildest conceptions are formed, and these half-waking fancies we call dreams. Usually, these fancies are ill-assorted shreds of casual remembrances, or of something that has made a strong impression on the mind. There is nothing supernatural about them, and any attempt to explain them is simply ridiculous. Persons who pretend to tell the meaning of dreams are either impostors, or weak self-deceived individuals.

Yet, there are some curious phenomena about dreams. The half-wakeful mind, in an unchecked imaginative condition, can do things that appear a little surprising. Musicians have composed tunes in their dreams, and so have persons of a poetical fancy composed verses, which they wrote down on waking. We have at times experienced a pleasure, no doubt enjoyed by many, that of waking up and still continuing to carry on a dream. To do this requires some delicate management. Feeling that we have awoken, we must take care to keep the eyes shut, so as to prevent any confusion between the imaginings and the exterior objects. If the eyes look about them in a way to convey impressions to the brain, the dream vanishes. In short, in certain half-wakeful conditions, the imagination is powerful, the more so, as being wholly unobstructed by reflection,

and dashes off into the most wonderful, and sometimes most beautiful conceptions.

When we pass from the phenomena of dreaming, and enter the domain of sleep-walking, or somnambulism, a higher psychological curiosity is reached. Here, we shall find it convenient to adopt some kind of classification, so varied are the forms in which the action presents itself. Many cases are on record, for instance, in which the sleep-action is a direct continuation of wakeful-action, without any break. Coachmen, postillions, and muleteers are known to have continued driving even after they had fallen into a drowsy sleep; the muscles and nerves continue to act in a sort of automatic manner, after consciousness has lapsed into slumber. M. Plater, the celebrated lutanist or lute-player, one evening dropped asleep while playing, after partaking of an unusually liberal supper; he continued to 'discourse sweet music,' correctly and tastefully, until roused from his drowsy nap by the noise of his lute falling on the floor. A 'reader' in a printing-office fell asleep while reading for the correction of proof, but continued reading down to the bottom of that page. In this case the probability is that his sleep only went to the extent of drowsiness; at anyrate, when roused up, he could not remember the words which he had just been correctly reading. Sir John Moore, during his ever-memorable retreat to Corunna, had to make forced marches night and day, as the only mode of averting capture by a vastly larger French army; his poor tired soldiers often slept as they marched, or marched as they slept.

A truly remarkable manifestation of somnambulism is that which can be brought about by the influence of other persons on the sleeper. External voices and sounds can move him to action even when his consciousness is asleep. Dr Carpenter and other physiologists have recorded many instances of this kind. A young naval officer, signal-lieutenant to Admiral Lord Hood at Toulon, sometimes continued his anxious duties for eighteen or twenty hours at a stretch; going to his berth, and falling instantly asleep, his mind was nevertheless so far awake on one particular subject, that if a comrade whispered 'Signal!' in his ear, it roused him at once and irresistibly. A young military officer voyaging with his regiment in a troop-ship, displayed a tendency which some of the mischievous wags around him took an unfair advantage of. When he was asleep in his berth, they would whisper in his ear, giving him all the details of a duel, a shipwreck, or a battle; his mind unconsciously followed the narrative, until he was roused to action by the climax, and woke by springing out of bed. Fortunately for society, such cases are rare; it would be a perilous thing if others could induce us to do what *they* wish, without consciousness on our part.

Sleep-writing is not the least noteworthy among these phenomena. Indeed, some of the instances are inexplicable in the present state of our knowledge; for things are done with closed eyes while asleep, which the persons certainly could not have done with closed eyes when awake. In some cases, although the eyes are open, ordinary vision does not seem to be performed by them. It would almost appear as if we were endowed with an additional sense, which only makes itself manifest in the somnambulist state. Be this as it may,

the recorded examples are deeply interesting. A young French ecclesiastic frequently rose in the middle of the night, went to a table, took pen and ink, and wrote portions of sermons. It was not mere mechanical work; he would make frequent corrections, to improve the grammar and syntax of his composition—changing, for instance, 'ce divin enfant' into 'cet adorable enfant,' and then into 'cet enfant adorable.' On one occasion, when watched by the Archbishop of Bordeaux, experiments were made to ascertain what kind of vision was being exerted. A sheet of writing-paper was quietly and cautiously substituted for that which the somnambulist had placed before him; he did not recognise the change, if the two sheets were similar in size and shape; an opaque screen was placed between his eyes and the paper, but he wrote on just the same. In another case, a young poet, not having finished some stanzas before he went to bed, rose in the night, went to his table, and finished them—so much to his satisfaction, that he applauded his own genius and taste; in the morning he remembered nothing of the matter. Dr Carpenter mentions the instance of a man who wrote accurately in his sleep, placing his words at good distances apart, dotting every *t*, and crossing every *t*. A young collegian got out of bed asleep, lit a candle, sat down to a table, took pen and paper, wrote out some geometrical and algebraic problems, extinguished the light, and went to bed again—his eyes closed all the time. On one occasion, an Amsterdam banker requested a mathematical professor to work out a very intricate calculation for him; the professor set his pupils to work; one of them went to bed with his mind full of the subject; and in the morning was not a little surprised to find his table covered with sheets of paper on which the calculation was fully and satisfactorily developed. The writing was in his own hand; he had risen in the night and done it while asleep.

Walking, without talking or working, is a familiar kind of somnambulist manifestation. Bellini's *Sonnambula* hits the right note here; poor Amina walks in her sleep, a tendency which first rouses the suspicions of her lover, and afterwards supplies the means of removing them. Dr Carpenter adverts to 'sleep-walkers who make their way over the roofs of houses, steadily traverse narrow planks, and even clamber precipices; and this they do with far less hesitation than they would do in the waking state.' Muratori speaks of an Italian nobleman, Signor Agostino Forari, who was much prone to sleep-walking, especially during the waning of the moon. One evening he played at cards with some friends, and went to bed early. His servant told the guests that, from symptoms already familiar to him, he believed that his master would walk in his sleep that night; Forari was lying on his back, with staring but unconscious eyes, cold hands, and a slow pulse. At midnight he drew aside his bed-curtains, rose, dressed, put on his hat and sword-belt, went to the fire as if to warm himself, went to a wardrobe closet, came out again, locked the door, and put the key in his pocket. The watchers held a lighted candle close before his eyes, but he took no notice of it, and did not seem to see it. He went down-stairs, out to the stable, stroked his horse, bridled it, and appeared confused when he failed to find the saddle. He mounted him, but gave up his intention of riding

on finding the gate of the courtyard locked; he led his horse to a water-trough, and allowed him to drink, tied him to a post, and returned into the house. Going into the billiard-room, he made a few movements with a cue, as if playing, then touched a few keys of a harpsichord, threw himself on the bed in his clothes, and slept soundly for ten hours. The servant cautioned the guests not to disturb him by any sudden noise during his strange unconscious wanderings, as it might injuriously affect his mind. A young lady, when nervously ill, was prone to walk about the house in a state of sleep, never falling over the furniture or other obstacles; her eyes were open, but she did not see in the ordinary way, for no winking or movement of the eye took place when a strong light was held close to her face. In a part of France where men are much accustomed to walk on stilts over swampy ground, a somnambulist one night walked across a swollen torrent on stilts; on awaking, he found himself too much afraid to recross the same torrent by daylight.

Hiding, instead of or in addition to *walking*, is sometimes as amusing as it is wonderful, in connection with the unconscious freaks of somnambulists. A man accustomed to attend a weekly market, one night rose from his bed, dressed, went to the stable, saddled his horse, mounted, and trotted off towards the market; finding a turnpike gate closed, he stopped; and this interruption had the effect of waking him. The *Times*, some years ago, recorded the case of a butcher at Lambeth, who one Sunday evening fell asleep in his chair by the fireside. He was seen to rise from his seat, fetch his whip, put on one spur, and go to the stable, where, failing to find a saddle, he mounted an unsaddled horse. When asked what he was going to do, he answered (still in a state of somnambulist sleep) that he was 'going his rounds.' Although prevented from leaving the stable, he nevertheless continued on horseback for some time, carrying on a wrangle about toll with an imaginary turnpike-man, to whom he exclaimed, 'Give us none of your gammon!' Even when removed from his horse, he continued for a time the movements of whipping and spurring.

Working, walking, doing, talking—there is a combination of two or three of these, sometimes all four, in the examples now under notice. A man dreamed that he saw a child fall into a river; he got up, threw himself again on his bed as if in the act of swimming, seized hold of a bundle of clothing at the corner of the bed, treated it as if it were the drowning child, held it with one hand while seeming to swim with the other, and put it down as if safely landed on the river-side; he began shivering and teeth-chattering, and said out audibly: 'It is freezing cold! let me have a little brandy;' and finally returned to bed again. A young military officer in the citadel of Breunstein was seen by his brother-officers to rise from bed in his sleep, go to a window, open it, clamber to a roof by the aid of the window-cord, seize hold of a magpie's nest with its young, descend to the room, wrap the young birds in a cloak, and go to bed again. Porati, an Italian apothecary, had a pupil named Castelli, who was much accustomed to somnambulist influence; more than once the young man was seen to rise from his bed while asleep, go down to the shop, and serve out medicines to imaginary customers.

Muratori relates that Giovanni Battista Negretti, servant to the Marchese Luigi Sale, was subject to somnambulist attacks, during which he re-performed the duties of the day in a way at once amusing and surprising. One evening, while sleeping on a bench in the kitchen, he rose suddenly, began walking about and talking, went into the dining-room, laid the cloth and other apparatus for dinner, and stood with a plate in his hand as if behind his master; after waiting some time, and the imaginary dinner ended, he put away everything, locked the sideboard, went to his master's bedroom, warned the bed, locked up the house, and finally retired to his own bed—his eyes closed all the time. On another evening he rose up asleep, got his own supper ready, ate it, went and drew some wine, and drank. It was observed, on these occasions, that he made much use of his arms, feeling his way rather than seeing. A bellringer one night rose up in his sleep, and, as if his companions were with him, prepared to go up into the belfry; after going out of the room and in again, he imitated the movements of a bellringer. A man who ate and drank occasionally while in a somnambulist sleep, evidently did not know the taste of what he was taking, for persons who watched him might change his food or drink without his perceiving it. One night he arose from bed, dressed, went to a *cabaret* or small wine-shop, asked for wine, received water, and drank it without noticing the difference. A young soldier, interested one evening by a discussion or reading with his comrades of a military combat, partook of supper, went to bed, and soon to sleep; in the night he rose, with eyes open, but asleep, and imitated with his arms a vigorous defence, rushed out of doors, and returned in a profuse perspiration. Weinhold notices the case of a musical student, who would often rise in his sleep, go into the study, place a sheet of music in proper position on the pianoforte, and play the piece correctly: once his friends purposely turned his music upside down, but he detected and rectified it; on another occasion, he found a string out of tune, opened the instrument, tuned the string, and went on with his playing. A stonemason, working for a master in Kent, was told by him one evening to go the next morning to a neighbouring churchyard, and measure the quantity of work done to a wall. He went to bed at his usual hour. Waking in the night, he was astonished to find himself dressed, in the open air, and in the dark. The church clock struck two, and then he knew he was in the churchyard. When a gleam of summer daylight came, he found that he had measured the wall accurately with a measuring-rod, and properly entered the items in a book. This case is a very remarkable one, for the man 'caught himself in the act' of somnambulist working, and was as much surprised at it as any looker-on would have been. Cassendi notices the case of a man who rose in the night, dressed while asleep, went down to the cellar, drew wine from a cask, walked back, undressed, went to bed again, and knew nothing about it in the morning. Once, when he did this, he woke in the cellar, and found more difficulty in retracing his steps in the dark than he had when asleep.

Here we close. Our budget is by no means exhausted; but the above-cited examples will

suffice to illustrate the Curiosities of Somnambulism, the faculty of thinking, versifying, calculating, walking, riding, working, writing, talking, singing, and playing during sleep.

A VICTIM TO MODERN INVENTIONS.

SINCE quite a child, Harry Gradient had been noted for his ingenuity in devising various mechanical oddities. When not engaged in graver pursuits, he was sure to be ankle-deep in some hydraulic scheme, or head over ears in some other of the mechanical sciences. His knack of invention was truly wonderful, though as yet—at the time I write, Harry was twenty-five—my friend had had few opportunities of turning it to practical purpose. He and I were both engaged in some engineering works on the continent, undertaken by an English firm. After we had been there some months, Harry received the welcome news that a relative had died, leaving him a nice little property and a comfortable house, some miles out of London.

Prior to leaving me to return to England—for there was much to be done in the way of settling the property and house in order—my friend said, with his usual enthusiasm: 'Mark, my boy' (my name is Mark Milmay), 'I shall expect you to come and see me when you come back. I suppose you are booked here for another eighteen months or so, and that will just give me time to set my house in order. Such a house, my boy! You've never seen such a one as it shall be. I mean to give up engineering for the public, and to exercise my talents in that way for my own benefit and comfort: my house shall be full of ingenious and curious contrivances, such as have never been seen before.'

Time passed on, and the business I had been engaged in was completed, and I returned home. I had written to Harry occasionally; and as soon as he heard I had arrived in England, he sent me a pressing invitation to come and visit him.

I gladly accepted the invitation, for I wanted to see my old friend again, and wrote to him saying I would run down the next day, and arrive at a station some two miles from his house, about six o'clock in the evening. I therefore packed a small portmanteau; and at the appointed time got out at the little roadside station. Harry was there waiting for me with his dogcart; and soon we were bowling along a pleasant country road.

'Look,' he cried, 'that is my house you see there among the trees; and this we are passing, and that one beyond, and the other, whose chimneys you can just see are all occupied by friends of mine—as well as some others you cannot see from here—and to each of them I have laid a telegraphic wire; so, when I have nothing particular to do of an evening, I telegraph: "Will you come and have a game at whist?" or, "I saw Brown in town to-day; he's coming to shoot with you to-morrow."'

We now arrived at the entrance-gate; Harry pulled up. 'I'll get down and open it,' said I.

'Sit still!' he cried. The gate opened of its own accord.

'Hollo! That's "Open sesame" with a vengeance,' I exclaimed. 'How is it done?'

'Why, don't you see; I have placed across the

drive a plate of iron like a shallow gutter; when I stop, the wheels pressing on this, cause it to sink slightly; this acting on levers and cranks underground, opens the gate; and a catch holds it so, until we pass over a similar one on the other side, which releases it, and the gate falls to.'

'Well, that's very convenient.'

'To be sure, it is: saves me a lodge and gate-keeper.'

We now drove up to the house, where the groom was waiting to take the horse, and the housemaid was opening the door.

'Do you see, Mark; they had notice of our coming. When we stopped at the gate, the weight of the dogcart pressed two electric wires into contact, which, passing underground, rang one bell in the stable-yard, and another in the kitchen, so that when we arrive, the servants are ready to attend upon us.'

We now entered the house. Miss Gradient met us in the hall, and I was introduced to her by her brother. I should never have supposed her to be Harry's sister, for she was tall and gaunt; and whether it was the blue spectacles or not, I cannot say, but she struck me as being frigid and severe; not at all the sort of person you would willingly care to offend. She, however, bade me welcome, asking me if I had had a pleasant journey, &c.

As I was taking off my overcoat in the hall, I exclaimed: 'Why, Harry, what on earth is that extraordinary-looking machine in the corner?' It looked something like a shower-bath without the curtains; attached to the upright supports were a number of crooked iron arms, and on the end of each a brush.

'Oh, that is my automaton brushing-machine. I will explain it to you. You see, at the bottom there is a small platform about a foot high; when you step on this, it gradually descends, and as it does so, sets in motion a train of wheels and levers—you are, in fact, the weight, the motive-power which puts all in motion. All these arms with the brushes begin to revolve, and brush you all over at once. But the most curious and complicated is the hat-brush at the top: you see it is something like a hat-box divided vertically in two parts; you perceive they are now some distance apart, so that you can pass between them; they are lined with bristles, and are fixed on two lever-like jaws. When the machine is set in motion, these jaws come together, and clasping your hat between them, they revolve rapidly; and in a few seconds your hat is brushed, at the same time as your coat, trousers, and boots. When the platform reaches the ground, the hat-brushes again separate, and you step out; then the platform springs up, and is ready for another dusty customer.'

'Well, it is a very curious contrivance. I should like to see it in action,' said I.

'That you shall soon do,' and he stepped on the little platform. All at once the clothes and shoe-brushes began to work vigorously; but the hat-machine did not come into action until the others had about half done their work; it then closed upon his hat, and spun round some fifteen or twenty times, and then flew apart, leaving him free to walk out.

'There!' said Harry. 'What do you think of that? Jump up, and try it.'

'No, thank you; not just now; some other time, perhaps,' said I; for I felt too nervous just then to trust myself to such an ordeal.

'Excuse me, then, for one moment, while I just speak to my sister, and then I will go up-stairs with you.'

He had no sooner left me, than, as I stood looking at the curious machine, I made up my mind to try it. Nobody was there to laugh at me if I jumped out suddenly; so I boldly stepped in. The brushes seemed to do their work very well; but I found I must keep in my arms, having got a knock on the funny-bone of my elbow from sticking it out too far. But the hat-brush—oh! horror! I had forgotten I had no hat on, and that I was a head taller than my friend; the consequence was, the infernal machine suddenly descended, and, seizing me by the head, whirled round at a frightful pace, till I thought no skin would have been left on my nose. I tried to stoop and escape it; but I got such blows behind from the revolving clothes-brushes, that I was glad to stand upright again. Fortunately, it was soon over, and then the hateful thing stopped. I opened my eyes, and saw Harry standing looking at me, convulsed with laughter. I felt very angry at the moment, as I rushed out, with one of my favourite long whiskers brushed across my face, and the other, back over my ear; while my hair was twisted into a vortex on the top of my head.

'It's a hateful machine!' I cried, as I tried to re-arrange my dishevelled locks.

Harry roared with laughter; but as soon as he could contain himself, he said: 'Don't you see it was not regulated for your height? If you had tried it when I asked you, I would have arranged it properly.'

I tried to laugh too, and said: 'Well, I've had brushing enough; let's go up-stairs now, for I am anxious to look in the glass to see if there is any skin left on the end of my nose.'

'What a jolly large room!' said I, as I entered the apartment prepared for me.

'Yes; this was my poor old uncle's room, and for a year or two before he died he used it for a sitting-room as well as bedroom. You see that large recess at the end: that is where he used to sleep. The bed is there still, as it is often handy; but as the room is only used for sleeping purposes now, I have had another and larger bed put in as well. I'll come and sleep in the little bed, and keep you company, if you like; that is, if you are nervous, and don't like being alone, as you used to be.'

'Oh, but that was such a wild, uncivilised place, one could never tell what might happen; but I am not nervous at being alone in England.'

'All right, old fellow; but I have got a great deal to shew you here. First of all, as it is getting dusk, I'll light the gas; that is done by electricity. I have got a quantity of batteries down in the cellar, and wires laid all over the house. Now see. I press in this ivory knob, which brings the wires into contact, and an electro-magnet turns the stop-cock; at the same moment, a spark passes across the gas-jet and ignites it. But that is not all. You see that bar on the ceiling above the lamp—well, it is composed of two metals, one of which expands by heat much more than the other; this causes it to bend when it gets hot; and as it does so, it acts on a lever and a rod above the ceiling, releasing a

catch which holds open the shutters, and they immediately close with a spring; as they do this, they catch against a sort of trigger, which in its turn releases a weight, that runs down and draws the curtains.'

Almost as he had finished speaking, the metal had become sufficiently heated by the now lighted gas, to act on the lever, and the shutters closed and the curtains drew themselves together as if by magic.

'That is very cleverly managed,' said I. 'But here is another knob with the letter A upon it; what is that for?'

'The A stands for alarm. I have one in each room, but have never required them yet. When either of them is pressed, a large alarm-bell on the top of the house is set ringing by electricity, and it continues to ring until the electric power is turned off again. We won't try that, as it would alarm the whole neighbourhood. But I have more to shew you. Here is a small recess with a curtain in front; I have had it fitted up as a shower-bath; it is self-acting: in a second or two after you enter, the water comes down. You can try it in the morning, if you like.'

'Thank you. You do indeed abound in ingenious contrivances; you, however, must have exhausted all in this room, at any rate.'

'O dear, no. Will you see if there is any water in the basin?'

I went to look, and remarked that some was just running in from the tap.

'Just so: in walking to it, you trod on a spring in the floor and set the water running; now, when you come away, you will tread on another, and cause it to run away.'

I again admired the contrivance; when he said: 'There is one more, and I think that is all. See; here by the bed-side are three speaking-tubes: this, marked number one, communicates with my bedroom; this, marked two, with my sister's room; and the third, with the servants' room. The two last I do not suppose you are likely to have any occasion to use, unless you want Jane to bring you up an early cup of tea.'

'Is Jane the pretty little housemaid who opened the door for us?'

'Yes, you sly dog; you were not long in finding that out. But mind, 'my pretty Jane' will stand no nonsense.'

'Why, Harry, I should have thought you would have known me too well to make such a remark—you know I never'—

'All right, old fellow; I was only joking. But come, you must look sharp and get ready for dinner.'

After Harry had left, and when I was ready to go down, I determined to try tube number one; I blew the whistle.

'Hollo!' replied Harry from the other end.

'I am ready to go down when you are; shall you be long?'

'I am ready now, and will meet you on the landing,' came his answer.

As we were going down-stairs Harry told me we should be four at dinner, as his sister had invited Miss Denbigh, a young lady who lived near. We found the ladies in the drawing-room, where I was introduced to Miss Denbigh. I could not help thinking she was more at home with Harry

than with his sister, and this was confirmed later on, when he walked home with her.

We had a very nice little dinner; and after the ladies had left us, Harry explained to me some more of his inventions, and shewed me his telegraphs, by which he communicated with his neighbours. While we were talking, one of the bells rang.

'Hollo,' said Harry, 'that's Pool. What does he want, I wonder?' Then followed a series of clicks. 'He wants to know if I will come and have a game of billiards to-morrow evening. I shall say I have a friend staying with me.' Click, click, click. 'He says: "Bring your friend with you." What say you, Mark? Will you go?'

'I have no objection,' I answered. Click, click, click, went the machine for some time; and then Harry came and sat down, saying: 'He says: "All right; he shall expect us."'

After a time, we joined the ladies in the drawing-room, and had some music and singing, as Miss Denbigh had a very nice voice; she and Harry sang some duets together, and appeared so much accustomed to it that they must have had a great deal of practice. In the room was a nice little organ, on which Harry gave a very creditable performance. He explained to me that it was blown by water-power. He had fixed a horizontal wind-mill on the top of the house, which pumped up the water; and from the height to which it was raised, he got sufficient power to work a small water-engine to blow his organ. When he had finished playing, he remarked: 'Perhaps you are not aware that this is a self-acting organ?'

'What do you mean?' I said. 'Can you wind it up like a clock, and make it play by means of a barrel?'

'Nothing of the kind, I can assure you; it has neither barrel nor spring.'

And now, to my great astonishment, a sonata by Beethoven peeled forth from the instrument; the keys went down just as though the fingers pressed them. But no fingers were there! I could not understand it at all.

At length, Harry let me into the secret. He had a musical friend, who lived only a few hundred yards distant, and who had an organ exactly like this one. Between the two, a cable containing a number of wires was laid, and on drawing out a certain stop, the current passed from one to the other, so that when a note in one organ was struck, the corresponding note was drawn down by an electro-magnet in the other. Thus, the piece Harry had just played had been produced simultaneously on the other organ, and now the friend was performing on his, and this was repeating it. Several pieces were played in this way, Harry, between times, holding conversation with his friend, and making suggestions by means of the telegraph. When it began to get late, Miss Denbigh declared she must be going; and Harry walked home with her, leaving me to the tender mercies of Miss Gradient. When we were left alone, she began asking me if I had seen anything of missionary labours during my residence abroad. I told her I had not. She then said she took great interest in such matters, and was now at work on some gauze frocks for negro children, thinking they would be cool and pleasant to wear. I was next cross-questioned as to the moral character of the people where I had been staying. I thought

Harry (the rogue) would never come back, and made up my mind that he must be flirting with Miss Denbigh, or he would have returned sooner, for he had remarked that she lived close by. However, he came at last; and, after a glass of grog and one pipe of tobacco, we went to bed. Before we did so, however, Harry told me of one more of his contrivances; this was to prevent the entrance of burglars.

'Between the kitchen and the front part of the house,' he explained, 'is a pair of swing-doors, on which are two brass handles; these are connected with an induction coil, and when I go to bed I turn on the battery power by a small winch in my room. Now, were betide any one who tries to open these doors in the night! If he takes hold of these handles, he immediately receives a tremendous shaking, and the muscles of his fingers so contract that he cannot open his hands to release himself, but must grin and endure it, until I choose to turn off the battery power.'

'But suppose you did not hear him, he might stand there all night.'

'Oh, but if any one touches this arrangement, a bell immediately rings in my room.'

We now went up to bed, Harry bidding me good-night at the room-door, but saying if I wanted anything I could speak to him through the tube. I was very soon in bed, and almost as soon asleep, and dreaming that I was in the train, and that the engine was shrieking madly. I awoke, and found Harry was blowing the whistle through the tube close by my ear. I drew out the whistle, and asked him what he wanted.

'Only to inquire if you are all right, and to say we breakfast at nine o'clock.'

I answered rather pettishly, I am afraid: 'I *was* all right just now, for I was fast asleep. Good-night, old fellow; don't wake me up again.'

It was all very well to say, don't wake me up again, but I could not go to sleep, do what I would. At length, after tossing and tumbling about, I determined to play Harry the same trick he had played me. I seized the tube, blew through it, and listened.

'Well?' came the answer, in rather a sleepy tone.

'I can't go to sleep; I wish you would come to my room, or let me come to yours. I think you had better come here, and you can sleep in the little bed, as you proposed.'

'I! I proposed nothing of the sort, and you know it, you base abandoned wretch! I shall tell my brother of your conduct in the morning.'

O horror! I had caught up the wrong tube, and had been speaking to Miss Gradient. What should I do? I tried to explain. 'My dear madam, I assure you it was all a mistake; I thought I was speaking to your brother.' But I got no answer. 'Madam,' I said, 'do you hear me?' Still no answer; she had evidently put down the tube, and would hear nothing more I had to say. I put in the whistle, and dropped my end of the pipe, and threw myself back on the bed to think.

The bare idea of my saying such a thing to that stiff old lady was awful to contemplate. How could I meet her at breakfast? At last I determined I must wake up Harry, and explain matters at once. I caught up the pipe, blew the whistle, and presently got an answer. 'Oh, I have made such a mistake,' I said; 'I wanted you to come

and sleep here, but I got hold of the tube that goes to Miss Gradient's room, and asked her to come instead; but of course I meant *you* all the time. Do come to me at once, or I shall try and find my way to your room.'

The reply only increased my horror and consternation; it was a shrill female voice, not Miss Gradient's, but evidently Jane the pretty housemaid's. She said: 'You wretch! I'd have you know as I'm a honest gal, and scorn ye. You won't find me a-coming near you; and if you come here, you can't get in, for cook's locked the door.'

'My dear girl, I assure you'—I commenced, trying to explain, but she began speaking from her end of the tube, and cut me short.

'I ain't your dear gal; and it's no use your talking any longer, 'cause I'm a-going to plug up the pipe with curl-papers; but I shall tell master all about it in the morning.'

I again threw myself back on the bed; large drops of cold perspiration stood on my forehead, as I thought of the awful muddle I had got into. Sleep was now not to be expected, and I longed for a glimmer of light. If those confounded shutters had not been closed there would have been a little. Then I made up my mind that I would feel my way to the window, and try and open the shutters. I got out of bed and felt my way along the wall. The darkness and stillness were dreadful. Suddenly I heard a noise in the room, and started; the next instant I found it was the water running into the basin: I had trodden on the spring in the floor. I now proceeded, still feeling my way along the wall; I must come to the window in time. 'Ah, here it is,' I muttered as I felt the curtains; but I was mistaken; it was the little bed in the recess. Again I journeyed onward, knocking my shins against the chairs, but at last I exclaimed: 'Here it is; these are the curtains.' It was a bow-window, and I passed through, to feel for the fastening of the shutters; when—How shall I describe my sensations! I screamed, I yelled, I scarcely know what I did. *It was the self-acting shower-bath I had got into,* and the water came down in a torrent on my devoted head. I suppose my cries were deadened by the curtains, for no one appeared to have heard me, and I emerged dripping from the bath. I was shivering. I drew off my wet night-shirt, and then felt my way to my portmanteau, and got another. This took me some time to accomplish, and I was glad to get into bed again. Strange to say, it was not long before I got warm; a glow seemed to come over me; but sleep was still out of the question.

During all this time I had never got over the oppression of the intense darkness. All at once I thought: 'Why, what a fool I am!' I had forgotten how easy it was to light the gas: I had only to press on the ivory knob. True, there might be some difficulty in finding it, but at any rate I would try.

Again I felt my way along the wall, and at length finding the knob, I pushed it in; but no gas was lighted. Instead, I heard a terrific noise overhead: it was the alarm-bell. All the neighbourhood would be aroused. What should I do? I did not in the least know how to stop it. I must try and find my way to Harry. As for the pipe, I could not be at all sure which was number one in the dark. In my hurry to find the door, I had

just upset a table with a variety of things upon it, when Harry, who had heard the bell, burst into the room at the instant of the crash, and exclaimed: 'What on earth is the matter?'

'Nothing,' I cried. 'If I could but stop this abominable bell! I was trying to light the gas, and pushed in the wrong knob.'

'There,' said Harry, when he had felt his way in; 'I've stopped it. But I must now run downstairs to the telegraphs. I can hear the bells ringing; the neighbours have heard the alarm, and are wanting to ask what is the matter;' and away went Harry, still leaving me in the dark. When he had sent them each a message stating that the alarm was all a mistake, he came back to ask me how it happened, and lighted the gas for me.

'I could not sleep,' I said, 'and wanted to get a light; but unfortunately, I pressed in the wrong knob and set the bell ringing.'

'Oh, well, never mind; it's all right now. But I must go and get into bed; I've got scarcely anything on, and my teeth are chattering so, I can hardly speak.'

'But, I say, I want to explain something to you. I've got into such an awful muddle. I wanted to speak to *you*; but I got hold of the wrong tube, and called to your sister instead, and she'—

'Oh, well, never mind; I'll make it all right in the morning. I can't stay any longer now.'

He was gone, and I had not been able to fully explain. Should I do so through the pipe? No; I would not risk that; perhaps I might get hold of the wrong one again, and only make matters worse. I lay pondering for a long time what I should do. I was seized with an ardent desire to get away. I looked at my watch: it was four o'clock; why, it would soon be getting daylight. If those confounded shutters were but open, I should be able to see if the day were breaking. Now, I had a light, surely I might open them. I would try. Yes; I could open them; but as the gas was alight, it prevented the catch from keeping them open, and, as I have said, they closed with a spring; however, as I held them back, I could see signs of the dawn, and at last I managed to prop them open with two chairs. How could I get away!—that was the all-important question—and without Jane seeing me too. Suppose I were trying to slip out, and were to meet her on the stairs in the dusk, she would probably think I had improper designs, and before I could explain, would rouse the house. Decidedly, if I meant to go, I must start before the servants were stirring. I consulted my Brulshaw, and found that there was an early train from the station where I got out last night. Only last night? Could it be? It seemed an age. Yes; I would make up my mind to go. I would leave a note for Harry, asking him to excuse my sudden departure, and begging him, whatever might be alleged against my moral character, to suspend his judgment until he had heard what I had to say, if we should ever meet again.

I found in my pocket a note with a blank half sheet; this I tore off, and writing my letter to Harry in pencil, I placed it on the dressing-table, and prepared to start. I had only a small portmanteau, which I could easily carry to the station myself. Soon all was ready. I cautiously opened the door, and crept noiselessly down-stairs, carrying my boots in my hand. In the hall I sat down and put them

on. Confound it; the front door was locked, and the key taken away. I must try some of the back entrances. I was determined to get out of the house if possible. I had not been in the kitchen, but I saw a passage which I had no doubt led in that direction. Cautiously I traversed it, for the early daylight was only dimly struggling in through the fanlight over the hall-door.

Presently I came to a pair of folding-doors covered with crimson baize. I pushed: they did not yield; but peering more closely, I saw a latch by which they were secured. I tried it; still the door would not open. There was another handle, and I put down my portmanteau to try this, when—'Oh! Oh! Ah! O-o-o-o-o! Murder! Thieves! Fire! Oh!' and so on, and so on, for about an hour, as it seemed to me, though I don't suppose it was really a minute. I was caught in the thief-trap that Harry had explained to me, but which I had forgotten. My fingers clutched violently at the handles, though I was all the time most anxious to rush away from them; but the muscles of my fingers were beyond my control, and I was suffering excruciating agony from the electric current, which was vibrating through me from head to foot. At last the shaking ceased, and with it my cries and shouts, which I had kept up vigorously all the time, and I almost dropped into a chair which stood near. Then I saw and heard Harry, who was asking me how I came there.

'I was going away,' I gasped. 'I have been most miserable all night; but this is the climax; it has almost killed me. Pray, open the door, and I'll try and walk to the station.'

'Nonsense!' cried Harry; 'come along upstairs. I am very sorry you have been so bothered, but I'll make it all right.'

'No; I shall never be happy here: you must let me go. I am very much obliged to you for your kind intentions; but what with tubes and bells, and knobs to push in, and handles to pull out, and batteries and coils, and one thing and another, I am almost driven out of my senses. Please, let me go, or I shall miss the early train.'

'At anyrate wait until I can call my man to put the horse in the dogcart, and I will drive you to the station—do, now. In the meantime, Jane shall come and get you some breakfast; I believe she is getting up.'

'No, no,' I gasped; 'I can't wait for Jane: I will start at once; I must be gone before she comes down.'

'But I will call, and tell her to make haste; I daresay she can come at once.'

'No, no! I must go at once. Good-bye. I am sorry to leave you so abruptly, but I—I shall lose my train.'

'Only stay two minutes, until I can slip on my clothes, and I will walk to the station with you then.'

'No, no; thank you. Good-bye, good-bye;' and I hastened away. But I had not gone far before I remembered that the electric wires were laid as far as the entrance-gate. I looked back; Harry still stood at the door, looking after me. 'Is there any danger at the gate?' I cried.

'Danger! What do you mean? There's no danger.'

'You are sure there are no knobs, or handles, or coils, or anything of that sort?'

'O no; nothing of the kind; you need not be

at all afraid. I wish, though, you would alter your mind, and come back.'

I looked back, and as I did so, I saw Jane opening the shutters; I shook my head, and cried: 'No; thank you; good-bye;' and made the best of my way down the drive. I cautiously pushed the gate open with my foot, and carefully avoided touching the handle. When I got on the high-road, I breathed more freely, and hastened on to the railway station. I just managed to catch the early train; and in due time reached London and my modest lodgings. As I entered my snug little room, I said to myself: 'Thank goodness, there is no cellar full of electric batteries with wires, and shocks laid on all over the house; and as for lighting the gas, I had rather do it with the humble lucifer, than with the most convenient ivory knob that was ever invented.'

EAST COAST FISHERIES.

ONE of the most interesting Reports laid before the House of Commons during the session of 1875 was drawn up by Mr Frank Buckland, in his capacity of Inspector of Fisheries. It related to the present condition of the fisheries of Norfolk and sister counties. From it we have gathered the following notes.

Yarmouth for eight hundred years past has been celebrated for its herring-fishery. Old histories tell us that in the days of Canute its site was a mere sand-bank; in Edward the Confessor's time it was just visible at low-water. At the beginning of William the Conqueror's reign it became constantly dry ground, so that fishermen from various parts of England came annually to catch herrings. This fishery has steadily progressed, and now, not only has the number of boats and men much increased, but also the depth and length of the nets have been augmented. Many boats now fish with nets a mile and a third long; some are known to use nearly two-mile length of nets. It is calculated that during the months of September, October, and November it would be well within the mark to say that for the capture of herrings, there are in use, every favourable night in the North Sea, between five and six thousand miles of netting. Formerly, these nets were made exclusively of twine; now, cotton only is used, having been found from its softness to be much better adapted to the purpose.

The kippered herring trade at Yarmouth finds employment for large numbers of women, ten thousand barrels being now yearly required for this trade alone. The fisheries of Yarmouth and Lowestoft are truly described as of national importance; for the herrings alone supplied through these ports would give about fourteen meals in the year to every man, woman, and child in the United Kingdom, allowing one fish to a meal. With regard to the proper seasons for conducting these fishing operations, we find that in January no herrings are caught. Towards the end of February the fishermen begin to catch spring herrings, and continue this work during the three succeeding months. The spring herrings,

however, are nothing but skin and bone; hardly fit, indeed, for human food. They are sold in large quantities to the Dutch and French fishermen as bait for catching halibut, turbot, &c. The real 'harvest of the sea' begins in September, and lasts until Christmas.

Lowestoft in former years derived some benefit from the mackerel fisheries; but the business was never a very remunerative one, and of late the number of boats engaged in it has much decreased. The merchants have to compete with the very fine fish caught off the Irish coast near Kinsale, and with the immense quantities of mackerel imported from Norway; these are packed in ice, and find a ready market amongst the manufacturing towns, as well as in London. Ice is also an indispensable part of the stock-in-trade of every Yarmouth fisherman, for unless the boats carried large quantities of it out to sea, they could make but very short trips. Large stocks of it are brought to Yarmouth, from the numerous broads and rivers of Norfolk, in wherries holding twenty or thirty tons; in the summer season, numerous cargoes of ice are discharged from Norwegian vessels. A mild English winter seriously affects the year's profits, for every block of ice needed has then to be got from Norway.

There is no regular oyster-fishery now at Yarmouth. Some years ago, when the anchor and chain of a lightship stationed off this coast were removed, a large number of oysters were found attached to them. Dredges were then used, and a considerable bed of oysters was found about the lightship. The supply was, however, soon dredged out, and the men left off working when their work ceased to be profitable. Mr Buckland, in accounting for the presence of this single bed, gives some interesting facts about the breeding of oysters, well worth quoting. When the mother-oyster spawns, she opens her shells and blows out the 'spat' in a dense cloud; not at all unlike the steam from a railway engine on a clear frosty morning. If the water is quiet, the tide calm, and the temperature warm, these young spat swim up and down and around their mother; when the sun is very hot, they ascend to the surface, and there play about like gnats on a still evening. It frequently happens that the tide drifts immense numbers of these living spat away from among the shells of the parent oysters; these swim, and are carried by the tide, and at last sink to the bottom of the sea. If the bottom is clean and favourable for their taking hold of some suitable 'culch,' they remain, and establish a new oyster-bed; if not, they all perish. This migration of the young oysters is somewhat analogous to the swarming of bees. The young bees leave the parent hive for the reason that if they staid in the hive there would not be space for the two families, and the general stock would suffer. In the same way the oysters, by a provision of nature, may be said to 'swarm,' in order that there shall not be too many on one spot. No pains seem to be taken by the fishermen to secure the natural enemies of the oyster. These are: five-fingers, usually called star-fish, and said to make excellent field-mauure; dog-whelks or borers; broad weeds; and burrs or sea-urchins. As many

as fifty or sixty of these burrs are often brought up in one haul of the dredge; but they are carelessly returned to the water. Unless better care be taken to destroy this 'sea-vermin,' Mr Buckland despairs of any really good oyster-culture on this coast.

Cromer and the adjoining villages along the coast form the headquarters of the crab and lobster fisheries. The extent of fishing-ground here is about sixteen square miles, described as one vast forest of sea-weed, and naturally a splendid breeding and feeding place for crabs. In former times the crabs were caught by what is called the 'hoop-net.' This was sunk to the bottom of the sea and worked with the hand, after the fashion of a minnow-net; this apparatus sufficed until crab-pots were invented. These are made of a cage of thick string netting fastened across bows of iron or wood; the cage is one foot nine inches long, and one foot three inches across the bottom. The crabs enter the crab-pots through two funnel-shaped doors, which act on the principle of a mouse-trap—easy to get in, but not so easy to get out; a side-door is let down, when the crabs are to be removed. The bait used are flat-fish, locally called butts. These fisheries, forming the principal industry of the Cromer district, are sadly on the decline; and their utter extinction is feared within a few years, unless some remedy against the wholesale destruction of small crabs, which is practised by some fishers, can be devised. Mr Buckland directs public attention to the horrible cruelties perpetrated in getting the crabs ready for market. They are actually placed in cold water, a fire lighted, and gradually boiled; the reason given for this being, that if they were put into boiling water at once, they would cast their claws. The crabs and lobsters are all sent away from the Norfolk coast packed in hampers; and this process of boiling crabs alive takes place at their several destinations or markets. Such cruelties should at once be stopped. It is suggested that the crab could easily and painlessly be killed by running an awl or needle through the heart, which is situated in the centre of the body, just below the mouth. Lobsters are usually plunged into boiling water and killed at once.

Medical men consider oysters, crabs, and lobsters should form the diet of all persons engaged in business or literary pursuits, where much wear and tear of the nerve-powers take place from day to day, for no substance conveys phosphorus so readily into the human system, or assimilates so readily and quickly with the system. Care must, however, be taken that the organs of digestion are not disturbed by too large a quantity of this kind of diet.

Mr Buckland concludes his Report with a variety of recommendations regarding the better preservation and further cultivation of these fisheries; a matter, he justly considers, of the utmost importance, not only to the fishermen and inhabitants of Norfolk, but also to the public at large, for the teeming population of England is eating up the products not only of the land, but also of the ocean; and he trusts that, should legislation, based upon his labours, take place, it will result in furthering the great object of his life—the increase of food for the people.

BIRD PROTECTION.

THE Sea-birds' Protection Act of 1869 met with general approval. Far from injuring man, sea-birds are positively beneficial to him. They act as scavengers at all sea-side villages; they fly inland and rid the farmer of noxious larvæ; at Flamborough and similar rocky coasts, they warn the mariner by their screams and clangour during fogs to give a wide berth to an iron-bound shore. Their elegant forms and lively evolutions in sea or air delight all eyes. It was high time that ignorant and brutal holiday-makers were restrained by law from wantonly massacring them in the breeding season, under colour of selling plumes for ladies' hats. But natural history journals, and the evidence collected by the Select Committee of the House of Commons in 1873, disclose considerable difference of opinion with regard to protecting wild birds, the ordinary denizens of garden, field, and mountain. Some ornithologists would provide a close season for birds which others would ruthlessly destroy. A third party, again, would throw the axis of protection around all alike, believing that nature would redress any apparent inequality in the abundance or diminution of particular species. The question is further complicated by the necessity for game, inasmuch as several of our finest native birds are inimical to the undisturbed rearing of grouse, partridges, and pheasants. Considerations of political economy are urged by game preservers with irresistible effect against those who would encourage the peregrine falcon to sweep round the Highland mountains; the magpie, jay, and hooded crow to diversify the monotony of winter scenery in England by their bright plumage. From a Return furnished to the House of Lords in 1873, we find that 1,041,960 head of game were sold in the United Kingdom by the licensed game-dealers in 1872, to say nothing of 580,388 wild-fowl. Over and above these, an enormous number of pheasants, partridges, and grouse must be included, shot by sportsmen for their own use; and it will be apparent that game provides very many tons of meat for the

people annually. The claims of the game preservers, therefore, cannot be alighted, as if their hobby ministered only to their own pleasure. The farmers must next be listened to, when they tell us that certain birds, such as sparrows and stock-doves, seriously injure the food supplies of the nation. They would have protection afforded to certain of the *raptores*, which are the natural foes of these marauders, forgetting that to exterminate the smaller birds is equivalent to suffering insects to devour crops and garden produce unchecked by nature's police. These conflicting interests look down with contempt upon the sentimental claims of those who love British birds merely for their interesting form, plumage, and habits; and yet the latter have also a right to be heard, apart from all æsthetical considerations, inasmuch as many of them are skilled naturalists and ornithologists, upholding theories respecting bird preservation and encouragement not altogether inimical to the welfare of the country, and capable withal of being supported by a strong array of facts.

The ultimate question remains between two great parties—those who would extend a moderate protection to all our birds, and trust to the balance of nature maintaining itself; and those who would bestow their chief pains in preserving game, and for that end would have every eagle, falcon, crow, and other vermin, trapped or shot. Most lovers of the country, and of that feathered life which lends so great a charm to its woodlands, would object to espousing either side in all its hard and sharp exclusiveness. Is it quite impossible to rear sufficient game for all ordinary needs, and yet to suffer the owl to inhabit its hollow tree, the peregrine and sparrow-hawk to sail round the moor and delight the naturalist's eye, the jay to chatter in the plantation, the hooded crow to flap lazily across the road without an overwhelming dread of the keeper's gun? The gardener, in all ordinary cases, by a little care, can grow plenty of fruit without diminishing the songs of black-birds and exterminating those beautiful birds, the bullfinches. For ourselves, we would rather find fewer partridges in our fields than be deterred

from welcoming an occasional falcon, hawk, raven, or other winged 'vermin,' as the keeper calls them, on our rambles; though when their numbers grew excessive we would have them thinned. That good naturalist, Mr St John, was of opinion that great part of the pleasure of a country ramble consisted in being able to watch the varied flights and habits of different kinds of birds. He would have seen no special beauty in a moor tenanted only by grouse, though himself the keenest of sportsmen. Mr Knox, again, is eloquent on behalf of the wood-owl, the jay, and other of our larger birds which are ignorantly shot down by many keepers. 'One poacher,' he believes, 'will purloin a greater number of pheasants' eggs from a preserve in a couple of days than all the unhappy members of the genus *corvus* which the keeper will shoot during an entire summer.' Major Morant* at once cuts the knots over which bird preservers and game preservers wrangle. His advice is: remorselessly destroy all *raptores* and other birds which feed on game; shoot and trap also all mountain-foxes, polecats, weasels, stoats, hedgehogs, and rats. As for cats detected in the woods or preserves, they must at once be put to death. Even tame cats ought to be taxed, like dogs, and confined during the breeding season of birds. Thus, by the old Roman plan of making a solitude, peace is obtained. The maximum of game will be procured, and all the small birds will be saved from the attacks of any foe, save the universal debt all owe to nature. It is apparently a simple though a sweeping remedy; but the reader who does not care for excessive quantity of game will observe, it would exterminate a great number of the most beautiful and interesting of our native birds and quadrupeds.

Much as lovers of birds will enjoy the anecdotes and statistics of Major Morant, we cannot promise him a large following of disciples. He writes, however, almost entirely in the interests of game, and though he avows a general love for all birds, the grouse is manifestly his favourite. His remarks too are many of them only applicable to the extensive open moors of Scotland, where he tells us he has enjoyed the sole right of shooting over more than a hundred square miles of country. As for the balance of nature, which many justly maintain would be broken by the over-breeding of one kind—a theory upheld by such names as Waterton, Tristram, Gray, and Freeman—he laughs it to scorn: 'The more carefully we have read all this mass of evidence,' he writes, 'the more clear it seems to us that at the present time the game preserver is the only bird preserver, the only real friend all our birds have.'

The grouse disease is naturally a subject of investigation with him, and he rightly, we think, discredits the evidence of Dr Günther and Canon Tristram, that peregrines and hawks generally

seize, as a matter of course, the last and weakest bird in a pack of grouse, thereby aiding, where they are protected, in stamping out the disease. The bird which a falcon seizes is, Major Morant asserts, simply the hindmost grouse, which sprang from the heather some twenty yards nearer to the hawk, and is unable to regain his lost advantage. Just as the exclusive dependence upon the potato caused famine and death among the Irish, our author deems that the exclusive feeding on frost-bitten heather during winter, of great numbers of carefully protected grouse, produces the grouse disease. The remedy lies in feeding them with a more generous diet, with corn, when the weather grows severe. The disease, it seems, does not extend within ten miles of the western coast of Scotland, where, he tells us, the influence of the Gulf Stream is felt, and the frost, consequently, is less intense. Our author defends the extermination of the *raptores* and other birds obnoxious to him as a game-fancier, by the example of the wolf, which our ancestors extirpated. The analogy, however, does not hold good, for the wolf was killed, like the wild boar, because it killed, or would kill, human beings.

With a view to strengthening his extirpation theory, Major Morant puts all the creatures whom he deems hurtful to the game preserver, on their trial; but the verdict, we need hardly say, is invariably against the 'plunderer.'

Among the curious details connected with the mode in which the falcons take their prey, we learn that they often hunt in couples. A mallard was seen pursued by a pair of peregrines into a Scotch loch. The female knocked him down—probably by a blow of her wing, as he was not seriously injured—and then seizing him by the back with one foot, and a bunch of heather with the other, she held him down in spite of his struggles, and screamed loudly for her companion. He soon came up, but detecting a keeper some seventy yards off, hurrying to the fray, he gave a sharp note of alarm, and both falcons escaped, the mallard being only too glad to fly off apparently unhurt. To the true lover of nature, such a spectacle is full of interest; and—though perhaps sundry grouse remained yet to be killed by the noble pair—few in this case would be inclined to sympathise with the baffled keeper. Our author draws a frightful picture of the devastation this pair of falcons would cause. They will kill in a year at least one thousand birds! This he endeavours to prove by giving each falcon a bird a day, and adding a hundred more for each of the three young ones which they will rear from May until autumn, making in all one thousand and thirty birds. A pair of falcons have been seen, he asserts, to bring six grouse to their young ones in four hours; therefore the one thousand and thirty birds may be deemed, he thinks, even under the estimate. It must, however, be borne in mind that falcons can fast for a long period, and that their food is not exclusively game, so that

* *Game Preservers and Bird Preservers: which are our Friends?* By G. F. Morant. London: Longmans. 1876.

these arithmetical arguments fail when applied to the actual state of things.

The golden eagle, now very scarce, is arraigned for destroying lambs. A shepherd told Major Morant that in the Isle of Rum during one season he lost more than seventy lambs by eagles. His employer then bought him a gun, and in the next eleven years he killed forty golden eagles by watching under shelter near dead sheep. But as a set-off, the writer admits that eagles benefit deer-stalkers, by killing grouse and hares in a deer-forest. Buzzards are charged with snatching a gray hen from her young, or a grouse from her nest; but they will not materially reduce the number of grouse on a well-stocked moor. Sometimes they rob the falcon of its prey, 'the latter making no objection, in fact rather liking the fun of catching another bird.' The hen-harrier meets with scant favour at Major Morant's hands, though he acknowledges to finding the crop of one which was shot, full of wire-worms. Grouse are much thinned by them, he says; and on one occasion he caught with his hands partridges, which were terrified at the hen-harrier's low flight and resolute hovering over them.

The peregrine falcon still answers to its old appellation of noble, as it never condescends to eat carrion. Owing to its depending more upon loneliness of situation than inaccessibility, we are glad to hear that it is more numerous than generally supposed in the west of Scotland. Peregrines leave that part of the country from October to February, but black indeed is their character in our author's eyes, while they do remain. The Major tells us that they 'break up nearly every pair of grouse in the breeding season. We know a fine estate which has been let for the last three seasons for five hundred pounds a year, which for nine years was neither let nor shot over, though three and four keepers were kept on it all the time. The grouse never increased, and five brace was an unusual bag. Since three falcons' nests were discovered in the neighbourhood, and they were regularly prevented from breeding, from twenty to thirty brace has become quite an ordinary bag. The presence of these birds on the ground made a difference of eight hundred pounds a year to the proprietor, as the estate cost at least three hundred pounds a year to keep up, instead of bringing in a clear five hundred pounds.'

Peregrines are not much seen by day, as they feed generally just after daylight, and then retire to the most lonely rocks. Five out of six birds they take on the moors are grouse or black game, and they frequently kill birds for sport. The gulls, with their white conspicuous plumage, are often knocked down; and a kestrel has been known to be struck dead and left for mere wantonness. Major Morant would, however, have the peregrine tolerated in a deer-forest, simply because he kills grouse, which often alarm a deer just as the stalker has secured his position and is about to fire. Spite of these formidable offences, we would plead for the peregrine as a beautiful and gallant bird, a link between ourselves and our ancestors' sport of hawking. Professor Newton knew one which for several years haunted a plantation in Suffolk, and preyed entirely on

stock-doves; and this habit, at all events in a farmer's eyes, ought to be an extenuating circumstance in its favour.

Still harder measure is dealt out to the sparrow-hawk. He catches old grouse and partridges, we are told, in winter, and decimates young pheasants in summer. Canon Tristram fancies that it will live entirely on the wood-pigeon; but this, we fear, is hardly correct. We happen to inhabit an ivy-covered house much haunted by sparrows; and one morning in August, a sparrow-hawk, in attacking them, dashed through the glass of a drawing-room window, being picked up, much to our sorrow for so fine a bird, with a broken back, but doubtless greatly to the safety of ornaments and china. Even the little merlin appears to be a criminal of the deepest dye. 'We have seen one,' says the author, 'overtake in fair flight and kill an unusually fine old grouse in the month of February.' He 'is a dreadful bird-murderer.' Even his scarcity tells against him; he is only scarce 'because his real character has been found out.' For the well-known kestrel some mercy ought to be shewn. Like the owl, the staple food of kestrels is undoubtedly mice; and surely this fact should condone minor offences, when either of these birds, on an emergency, helps itself to a young pheasant. But no! that bird too must at once be destroyed! For our part, we trust that wild scenery will long possess the pretty accessory of a kestrel hovering in the foreground. He and others of his tribe are at anyrate perfectly welcome, once in a way, to one or two of our young partridges.

Halting at the *corvix*, we must protest against raven, crow, rook, Royston crow, magpie, and jay, being handed over indiscriminately to the keeper's gibbet. The raven, from his many interesting associations, claims a little protection; the good he does as a scavenger ought to tell largely in his favour. Doubtless, he is omnivorous in taste, and would respect the laird, were he to find him senseless on his moor, as little as he does the laird's young grouse. But he is a brave bird, and exterminators of the falcon tribe might do well to remember that he will, single-handed, attack the eagle and hunt him out of the country. Still, 'we have the raven and its kind to thank, if grouse are five shillings a brace instead of two, and if thousands of square miles in Scotland still afford neither sport nor rental to their owners.' Thus even the enormities of the *falconide* are forgotten when a raven is in question. Farmers acknowledge, or ought to acknowledge the beneficial services rendered by the rook in keeping down wire-worms and other destructive larvae. But our author unluckily listens to a serious charge that rooks 'eat more game-eggs than all other birds on earth.' The usual verdict follows as a matter of course. Nothing can exceed his malevolence towards the unfortunate *corvix*. No excuse is of any avail. We hesitate about the hooded crow, though he is quite cunning enough to take care of himself. That that plunderer, however, can vary his diet, is shewn by our author, who writes: 'We must own we once opened the crops of some full-fledged young hoodies, and found them full of insects, principally beetles. But then,' adds our ingenious author, 'their ancestors had eaten eggs for so many years in that country that there were no birds left to lay any within three miles of their nest.'

In the book under notice, the author distinguishes lowland from mountain foxes, in his remarks on the quadrupeds that devour birds or their eggs. Sympathy for fox-hunting naturally enough biases his judgment in favour of the former. 'Rear rabbits in abundance for the lowland fox, and protect young game and poultry as much as possible,' he says, 'with wire-fencing; then they need not be shot down.' But with the mountain-fox it is a different matter. 'A keeper of our own one morning at daylight shot a vixen returning to her den, and in her mouth were a hen-grouse, two grouse's eggs, and two frogs.' He kills hares, too, and young fawns, and, worst of all, habitually kills lambs when rearing his cubs. 'It is not unusual to count twenty and twenty-five lambs' skulls round the cairns where they feed their young.' It is curious, however, that they never kill lambs near their earth. They will pass flocks of sheep close at hand, and kill and carry lambs from a distance of miles to their earth. So great is the necessity felt for exterminating hill-foxes, that it is customary for sheep-farmers in many parts of Scotland to have a grand annual raid. Shepherds collect from all quarters, and with the assistance of their collies circumvent their wily foes, and track them to the death. We endorse the statement that the mountain-fox is a dreadful pest, and ought to be destroyed.

The same doom is relentlessly pronounced on the polecat, stoat, and weasel. The polecat is a ranger over miles of country, and can be tracked in snow high on the mountains, as well as along the sea-shore. All the *mustelide* are blood-thirsty, kill without stint, and often leave one victim, after merely sucking its blood, to do the same to another. Hence, our author condemns them, though even their services, in keeping down rats, might be taken into consideration. The poor hedgehog, from a game-fancier's point of view, must be ruthlessly destroyed. It is too true that he eats eggs. Here, however, we again bethink ourselves of his services in keeping down earth-worms and insects, and incline towards mercy. The wild cat is practically extinct in England, and so rare in Scotland that his case need not be considered; but Major Morant has a strong cause of complaint against the common cat when it has once taken to the woods. It is one of the worst enemies that game possess.

A perpetual battle is fought in the country between the friends and foes of two birds, both of which have a great tendency to increase—the wood-pigeon and the sparrow. Both are undoubtedly noxious to field and garden, and yet they possess counterbalancing virtues. Mr Cordaux gave evidence before the Select Committee that the former picks up an enormous number of noxious seeds, which would otherwise fill the ground with weeds; while the latter keeps down insects, in conjunction with our other insectivorous birds. Both birds, however, must be kept in their place, to fulfil their parts in rural economy.

Major Morant's book possesses very considerable interest, and abounds in new and striking anecdotes of our rarer birds and beasts. We devoutly trust, however, that the author will not make many converts to his theories of *annihilation*. Luckily, all men are not game preservers to the extent of extirpating all game destroyers; and many who are fond of shooting, also delight in seeing the

sweep of wing and varied flight of the feathered children of the waste. In bird preservation, as in everything else, there is room for common-sense. Ruthless extermination speedily avenges itself, to say nothing of robbing rural scenes of some of their most beautiful and interesting features. In conclusion, we have further to add that the destruction of small birds, such as finches, for the sake of selling their wings and feathers as ornaments for ladies' bonnets, is simply atrocious, and a scandal to the age. On this point, we hope soon to have something to say.

FALLEN FORTUNES.

CHAPTER VII.—MAKING THE BEST OF IT.

'SOME one has been to call,' observed Mrs Campden to her companion, as, driving up the carriage-sweep within an hour or so of dinner-time, her sharp eyes remarked the recent traces of wheel and hoof. 'I should not wonder if it was Lady Blanche Ealing.'

'Mr Holt and the boys were going to the sports, were they not?' returned Mrs Dalton, not, it must be confessed, with any signs of overpowering interest in the question; for the last two hours her thoughts had been at home—watching for her husband's telegram; and neither the calls, nor her companion's conversation, had been able to secure the attention which she would fain have given to them.

'My dear Edith'—she spoke with an emphasis dictated by a due sense of the fitness of things—'you don't suppose I should have sent out anything but the dogcart with that Mr Holt? There has been a pair of horses here—look at the hoof-marks. It is very annoying if it has been Lady Blanche, for that will be the second time I have missed her. Such a charming person; the Earl of Beaufampton's daughter, and, socially speaking, the lady of this part of the county.—Who has called, Marks?' asked she, of the butler, who received them at the Hall door.

'No one, ma'am—leastways, Mr Dimple came on some business about the church-sittings; but it would do just as well, I was to say, with his compliments, another day.'

'But some carriage has been here, beside the dogcart.'

'O yes, ma'am; the barouche. Master took out the young ladies in it.'

'Is there any message for me, Marks?' inquired Mrs Dalton, unable any longer to bear her suspense, though unwilling enough to interrupt the inquiries of her hostess.

'Yes, ma'am; a telegram: Miss Jenny has it.' The invalid girl had been for so many years a child-guest at Riverside, that in old Mark's eyes she was still Miss Jenny, and would probably remain so for ever. 'She is up in her own room, I think, ma'am.'

Mrs Dalton flew up-stairs to the apartment thus indicated, where she found Jenny upon her spring-

couch—the unwonted fatigues of the day having somewhat exhausted her frail frame.

‘O mamma! there is a telegram from papa.’

‘What is it, child?’ inquired her mother anxiously. Jenny put the slip of paper in her hand without speaking.

Shall come by the 6.30 train, as proposed. Nomp.

‘Why, what does he mean by Nomp?’

‘I am afraid it means he is not elected: he wished us to understand, without telling others, that he was no M.P.; at least, that is what I make it out to be.’

‘Dear, dear!’ sighed Mrs Dalton.

‘I am very sorry, upon papa’s account, mamma, because I am afraid he will be disappointed; but except for that—you know we have often agreed that he will be happier as he is.’

Mrs Dalton did not reply, but withdrew at once to her own room. There was something in the bareness of the communication that she had just received—though telegrams are not expected to be effusive—that chilled her, and seemed to give an additional seriousness to the missive of the morning. The latter had enjoined silence upon her as regarded her husband’s anticipations of the election, and even now that it was over he seemed to have a disinclination to make known the result. What did this reticence augur in one who had been wont—until of late months—to be the most frank and demonstrative of men? It was true that he had given utterance to no expression of annoyance, but the brevity of his message spoke to her in language that she alone understood, of the chagrin and bitterness that he was enduring. ‘No M.P.’ was all he had said; but no ‘Form’ with which the Telegraph Company could have supplied her would have been sufficient to contain her paraphrase of those few letters. She was consumed with vague apprehensions upon his account; for she knew not *why* her husband should be thus cast down, and that was the most bitter thought of all. She was far too wise, however, to consult upon such a matter with a third person, or to allow others to read her anxiety; and she presently descended to the drawing-room, to await her husband’s arrival, as though only dinner had been in prospect. She found the rest of the company already assembled there, and became at once conscious that something unpleasant had occurred among them. The quarter of an hour before dinner-time is proverbially an embarrassing period, but it was obvious that on this particular occasion it had been a very uncomfortable one. Her first glance, mother-like, was given to her own belongings, and so far as they were concerned, it seemed that the explosion—which had certainly taken place, for the air was still heavy with the smoke of it—had spared them, whatever harm it had wrought to others. Jenny was on the sofa with a book before her eyes, which would not have been the case—for she was bold as a lion—had she been under fire; Kate, with a flushed cheek, was looking out of the window, to avoid, as her mother guessed, gazing on the victim under punishment; Tony was standing by her with his hand fast clutched in hers, but his glowing face turned towards the scene of action; Mary Campden was smoothing her gown, an action of hers whenever ill at ease: all these, it was

evident, were non-combatants. At the mantelpiece, with her back to the ferns and flowers which filled the useless grate, stood the mistress of the house, and by her side its so-called master was twirling his whiskers as though he would have twirled them off; and at some distance stood Jeff, with a pale face and angry eyes.

‘I am sorry to say, Edith,’ said Mrs Campden, addressing the new-comer, with gravity, ‘that my husband has thought proper—if the word proper can be applied to such a proceeding in any wise—to take your daughters with his own to Bleabarrow sports.’

‘Dear me! I am afraid my girls must have worried him very much to induce him to do it,’ said Mrs Dalton good-naturedly.

‘That is just what we did, mamma,’ said Jenny, looking up for an instant from her book; ‘it was all our fault, but mine especially.’

‘If my husband means to excuse his conduct at the expense of two young ladies’—

‘There were three,’ observed Mary quickly; ‘it was I who was most to blame, because I ought to have known you would not have liked it, mamma.’

‘I am not addressing myself to you, Mary, at all,’ continued her mother with dignity; ‘be so good as not to interrupt me.—I say it was shameful to take advantage of my absence, Mr Campden, to order the barouche and take these girls on such an abominable expedition.—It is natural, Edith, being my guest, that you should endeavour to make light of it.’

‘But, indeed, Julia, I don’t think it any serious matter,’ answered Mrs Dalton; ‘and, of course, the girls would be quite safe in your husband’s charge, in case of any annoyance.’

‘Well, well; you are easily satisfied, Edith,’ returned the other lady, throwing up her hands; ‘but if you knew what I know about such places—what I can’t help knowing from my position here—the sort of people that attend them’—

‘There was Lord Riversdale,’ observed Mr Campden dryly.

‘Indeed! I am sorry to hear it. But not his wife, sir.’

‘I am sure I don’t know whether she was his wife,’ said Uncle George, still more dryly; ‘there was a youngish woman with him.’

‘Do not heighten your disgraceful conduct by disreputable talk, I beg,’ answered Mrs Campden icily. ‘I am quite sure that there was no lady at Bleabarrow, except those you took there in my barouche.’

‘I really don’t think that the girls can have taken much hurt, dear Julia,’ reiterated Mrs Dalton, the peace-maker.

‘I don’t know as to hurt, Edith; but I suppose even your good-nature would draw the line somewhere. What would you have said, for instance, if any gentleman of your acquaintance had not only gone to such a place as Bleabarrow, but taken part in the sports; entered as a competitor with drunken persons’—

‘My good lady, no drunken person can run up hills,’ remonstrated Uncle George; ‘you don’t know what you are talking about; you don’t, indeed.’

‘Oh, thank you! I am sure you are the pink of courtesy; as polite a husband as you have shewn yourself a judicious father. However, I was addressing myself to Edith. I was asking

what she would think if you, or any one of your guests here, should have taken it into their head to compete with such ruffians !'

'Well, really, I can't imagine Mr Campden doing that,' said Mrs Dalton ; 'and, of course, it would be very indecorous.'—

'The height of indecorum,' interrupted Mrs Campden, looking round triumphantly ; 'there ; were not these my very words ?—You see, Mr Geoffrey Derwent, that even those who are generally most ready to excuse you, have nothing to urge in extenuation of your conduct. Mrs Dalton quite agrees with me—that for a person in your position, an inmate of this house, and who has always been treated as one of the family, to compete with common men for gain'—

'I did not compete for gain,' said Geoffrey indignantly ; 'I gave the money—it was three pounds—to the man that came in second, and only kept the belt.'

'That is, you did not take what you had really need of—you threw away, forsooth, three gold sovereigns, like a young millionaire—and only indulged yourself by mixing with the lowest of the low'—

'It was by my advice, Mrs Campden,' said one in cold and measured tones.

At the window, close to where Kate was, Mrs Dalton perceived for the first time that Mr Holt was also standing, half concealed by the curtain-folds. 'I own it was foolish and injudicious ; but it was I who proposed that the young gentleman should enter himself for the Guide Race.'

'That had nothing to do with it,' said Jeff sturdily ; 'I always meant to run, and should have done so whether any one had proposed it or not.'

'Of course you would,' continued Mrs Campden contemptuously ; 'to mix, as I have said, with the lowest of the low, and to earn their good opinion, was your only motive.'

'What ! has Jeff been electioneering, like me ?' cried a lively and genial voice. The speaker, who stood at the open door, had a bright and buoyant look, which by contrast with the faces around him, seemed to typify good-humour and ignore all angry passion.

'O John, how glad I am to see you !' whispered Mrs Dalton, as she sprang into his arms.

'Papa !' cried Kate delightedly. Everybody in the room, including, perhaps, even Mrs Campden herself, who had shot off all her sharpest arrows, seemed pleased to see John Dalton at that moment.

Having kissed his wife, he turned at once to Jenny, to prevent her rising to receive him, and embraced Kate and Tony, and then made his salutations to the rest like one who is used to be welcomed. A more conventional man would have addressed his hostess first, and his own family afterwards, but Dalton always behaved as his instincts prompted him ; and they fortunately happened to be good. He had not a handsome face, nor even an aristocratic one, yet it was one which attracted every eye. If you had seen him in the pit of a theatre (where, however, you never would have seen him, for he was not a man to patronise the pit), or on the crowded platform of a public meeting, you would have asked straightway, 'Who is that man ?' He had passed middle-life, and his face and forehead were deeply lined ; but neither, as you would have said, by thought nor care, so genial was the smile upon his lip, so lively the sparkle of his eye. His

complexion was dark to swarthiness ; his hair, worn much longer than was customary, though he had neither moustache nor whiskers, was black as jet ; yet, so far from this producing a sombre effect, his appearance suggested gaiety. If he was not laughing, he always looked about to laugh, not at but with you ; his air and manner suggested not only the desire to please, but sympathy, and the readiest comprehension of your tastes and character. He was not conciliatory, for if you shewed antagonism—or even a slowness in reciprocating his advances—the sunshine left his face at once, and he set you down as a fool or a knave. I am bound to say, though sometimes guilty of a grave injustice in these hasty judgments, he was generally right. It was said by morose and ill-natured persons that John Dalton could be as 'nasty' in temper as anybody ; but this was not true ; he was hasty, however, and impetuous, and holding a deep-seated conviction that the man who could quarrel with so agreeable a fellow as himself must needs be a scoundrel, he behaved towards him accordingly. This conviction was a dogma of which—though more true than most dogmas—he had not been persuaded in a moment ; a long course of social success had induced it.

Dalton had had neither high birth nor much money to recommend him to the notice of the world ; yet had possessed enough of both to render a struggle for existence or position unnecessary ; he had not been compelled to set his feet on the lower rungs of the ladder, but had had them placed there by his father, who had been a man of fashion and a hanger-on of the court for a quarter of a century before his death. The sayings of 'Tom Dalton' had been considerably quoted before the reputation of his son in the same line of business had caused them to pale and fade away from the recollection of Pall Mall. Some old fogies were still found in that cynical neighbourhood who averred that John Dalton was not after all so clever a fellow as his father ; but such remarks were justly ascribed to the disposition of persons of a certain age to praise the past at the expense of the present. He did not indeed possess the biting satire for which his parent, the friend and rival of Brummell, was distinguished—though if you trod upon his tail ever so slightly, he could give an epigrammatic snap that had marked more than one heedless gentleman for life—but his ordinary talk was bright and vivacious, and he was voted 'good company' wherever he went. By profession he was a barrister, but he had never practised, or given himself the chance of practising ; he had never done anything but please himself in all his life, yet in so doing had somehow contrived to please everybody else ; not so much from his kind heart or his good-nature (though he could boast of both), as from a certain nameless charm of manner, which won over to him both man and woman. He was not a hero, nor anything at all like it ; but if he had been one, his *valet de chambre* would have been the first to acknowledge it. He was not a prophet (for he little knew what was at this moment awaiting himself) ; but if he had been one, his own people would not have denied him honour. His wife was devoted to him ; his children adored him ; and their sentiments had his fullest concurrence. 'If people are only nice to me,' he once confided to a friend, 'I am the nicest fellow people can meet.'

Unhappily, there are some people that cannot be nice, however certain may be the reciprocity, and Mr John Dalton had just been experiencing that fact during his canvass of the electors of Bampton.

'Well, Dalton, may we congratulate you as a British senator or not?' was Mr Campden's inquiry as he shook hands with his guest.

'You may congratulate me, my dear fellow, as having escaped being the representative of the most rascally constituency in England. 'It was a very narrow shave, however,' added the speaker briskly; 'another half-dozen votes would have done it.'

Mr Campden whistled mournfully, and the rest began to express their condolences after their several fashions, when Mrs Dalton broke promptly in with: 'John, dear, there is scarcely time, even as it is, for you to dress for dinner.'

'I know that, my darling, and therefore I am not going to do it,' whispered he.

'But Mrs Campden is so particular.'

'I know that too; but I'm not going to dress.—Pray, do not wait for me one minute, ladies and gentlemen,' added he aloud, and then left the room, not sorry, perhaps, notwithstanding all his presence of mind, that he had got over the declaration of his failure.

'My husband hopes you will excuse a morning-costume to-night, Julia,' said Mrs Dalton; 'nothing distresses him so much as coming in late for dinner, or keeping anybody waiting.'

'Oh, certainly,' returned Mrs Campden with a stately inclination of her head; she was pretty well aware how the case stood, and felt satisfied to get an apology out of Mr Dalton even by proxy. He was indolent, as regarded all physical exertion, and despised the small conventionalities on which his hostess set such store. She knew, or thought she knew, that all the members of 'county families' dressed for dinner every night, and was therefore resolved that her own folks should do so. So poor Uncle George—who during his early life had never worn 'black things,' as he called them, except on the rarest occasions—had every day to divest himself of his light summer clothing and don the broadcloth.

Mr Holt was always attired with the most scrupulous regard to the fitness of things; and Dalton, as her guest, ought to have been amenable to her wishes in this respect; but it was really very difficult, she complained, 'to get him to conform to the most ordinary usages of society.' She did not dare to be imperative with him, for he was one of the few people of whom she stood in dread; and when she had once attempted to—what she was pleased to call—reason with him, he had overset her with an epigram, which, if she had understood, she would have termed 'very conceited.' 'Madam, nobody minds what is one's suit so long as one is a *trump*.' Upon the whole, Mrs Campden had her reasons for not liking Mr Dalton, but she liked to have him at Riverside, from the popularity which his presence conferred upon it. She had more invitations from the county families—who, she had her suspicions, looked down upon her husband, for being a *nouveau riche*—when the Daltons were with them, and a better chance of getting a morning call from Lady Blanche Ealing; nor was it without some gratification that she found John Dalton

taking her into dinner, though his conversation flew over her head, and did not interest her half so much as the proceedings of the servants or the state of the *entrées*. On the present occasion, he was full of the topic of the election—not that he liked it, but lest he should be supposed to shrink from it as a sore subject—and very amusing in his description of his rival (and conqueror), one Mr Griggs. This gentleman, who was no great orator, had accused him of 'labouring under the advantage' of being a skilled legal debater, which was certainly a most unjust imputation, as Dalton had but once opened his lips in court in his life, and then only to move for a rule.

Griggs had also described Mr Disraeli as being 'the greatest *living* statesman of this or any other age.' And Griggs had also told a story on the platform so discursive that it had touched upon almost everything, yet had somehow not arrived at the point. During the progress of it, a voice—a somewhat thick and drunken voice, but still one with an evidently Liberal tone—had interrupted this narrative by a conversation with an imaginary friend, one 'Samuel,' supposed to be at the other end of the town-hall, which was crammed with Griggs' supporters. As the story went on and on, the voice grew more and more dolorous, and at last inquired: 'Samuel, do you like this story?'—a question answered by such a peal of laughter, even from his best friends, as to destroy Griggs' eloquence for the remainder of that evening.

It was by no means John Dalton's habit to monopolise the conversation, and it was only by public request that he now communicated these particulars; but he had never seemed in higher spirits. Only two persons at table were aware that he was acting a part, nor could one of these have detected it, but for certain exclusive information that he possessed. Mrs Dalton, on the other hand, knew that her husband was 'not himself,' although ignorant of the precise nature of what troubled him. Behind those sprightly tones, that joyous laugh, she detected that Black Care was sitting. The subtle instinct of much love had discovered it to her, else there was nothing to indicate it, except perhaps an unwonted grimness in her husband's humour.

For example, Mr Campden had inquired of him, since he had been last in London, whether town was empty.

'No, sir; there are still several toiling millions there, of our own flesh and blood.'

The tone of the Platform, the air of the would-be Representative, were admirably assumed: it was evident that the speaker was still contending with Griggs for the suffrages of the Bampton free-men.

'The club, however, had nobody in it, I suppose,' continued the laughing host, 'except Disney?'

'Disney is out of town.'

'Oh! that is impossible, Dalton; he told me himself that he had not left London for a quarter of a century, and then only to visit Brighton. Oh! Disney can't be out of town.'

'He is, however, I do assure you—since there are no intramural interments—for he is dead!'

'Oh! Mr Dalton, how shocking!' ejaculated Mrs Campden.

'Yes, indeed, madam; but the gentleman could not help it. If you had known him as well as

your husband and I did, you would feel sure of that. He had no desire for change—except in one respect: even when he dined alone on a mutton chop, he *would* always dress for dinner.’

‘And very right, too, I think, Mr Dalton.’

‘No doubt, madam; and I hope he is at this moment reaping the reward of such undeviating propriety.’

‘Well, I am sorry poor old Disnay is gone,’ sighed Mr Campden. ‘We might better have spared a better man.’

‘I can’t understand how *that* can be, George,’ observed the hostess severely.

‘When did the poor old fellow go off the hooks?’ asked Mr Campden, too affected to notice a reproof which, under other circumstances, would have reduced him to silence.

‘Well, his ghost was seen at half-past seven last Thursday.’

‘His ghost!’ echoed several voices.

‘Yes; it was seen coming into the club at what had been his usual dinner-hour.’

‘Oh, what nonsense!’ cried Mrs Campden. ‘How did they know it *was* his ghost?’

‘Well, they knew it was not himself, because he was in morning costume. Everybody said that Disnay must be dead; and what everybody says must be true.’

I don’t think Mrs Campden ‘liked that story,’ any more than friend ‘Samuel’ liked the narrative of Mr Griggs; but to the rest of the company it seemed droll enough.

When the ladies had withdrawn, John Dalton was even still more amusing; but it is my opinion that the talk of us men ‘after dinner’ should be as sacred as the conversation in the drawing-room, that takes place during the same period among the fair sex, and which has never been revealed to mortal man. The talk was mainly between John and his host, for Mr Holt said little. He was turning over in his mind what he should say presently in the smoking-room, or rather how he should say it, when he and Dalton should be left alone together.

CHAPTER VIII.—JOB’S COMFORTER.

The question of whether a ‘little music’ after dinner is socially a desirable thing or not, has been much debated: we know what a certain statesman thought of it—but then he was very bitter against every species of occupation that was not ‘improving.’ Musical people, of course, like to hear the piano going—if the performer understands her art—and there are a number of other persons who like to be thought musical, even if they are not, who hold their fingers up, and whisper ‘Hush!’ during the performance, and when it is over, exclaim: ‘Oh, *thank* you!’ as if the notes had been five-pound ones, and they had pocketed them all. Nor do the rest of the company much *mind* it, if the pieces played are not too long. Old gentlemen will go on with their gossip much as usual, and old ladies will keep time with their heads quite cleverly, until they drop asleep, to be presently awakened by the sudden silence. But if there are any present with a hidden care, it is curious how often their secret is disclosed by a few bars of music. They can no longer laugh or talk, but are left the prey of the anxiety within, and it comes out in the

expression of their face, and in their very posture. Those earnest lines—

Dear friend, whom, grave or gay, we seek,
Heaven-holding shrine,
I ope thee, touch thee, hear thee speak,
And peace is mine—

were addressed to his piano by a true lover of it; and such persons, even when dejected, may be soothed by its sweet tones; but that is not the case with those who have no particular taste for music. It makes their sad thoughts more gloomy, while it takes away from them the opportunities of disguise. From John Dalton’s face the smile has fallen away like a dropped mask, as he leans an elbow on the mantel-piece, and listens, or seems to listen, in the drawing-room at Riverside, to his daughter’s singing. Kitty has a fine voice, which goes a great way up, and comes a long way down, and goes on without stopping for breath almost as long as a camel can go without water. Mr Holt, who is turning over her leaves, finds that post no sinecure, and being utterly ignorant of music, is never quite sure when she has reached the bottom of the page. Moreover, he cannot keep his eyes from wandering to that statue-like figure by the fireplace, that looks so cast down even now—when it has not yet heard the worst, nor even half the worst, that must needs be told to-night. Others in the room have their troubles: Jeff, pretending to be immersed in a book, is frowning over the top of it at Mr Holt, who must, he thinks, be an idiot not to see when a young lady would rather turn over her leaves for herself; and Tony, only enduring the music, as a lesser evil than going to bed, which, as he is well aware, would be the alternative. The windows are open, and he would gladly be in the open air, but the rain is falling, as it often does at Riverside, so that that avenue of escape is barred. Mr Campden has fallen asleep—which is foolish of him, as he will be all the more wakeful when the time arrives for his curtain-lecture, when all the wickedness of his afternoon’s expedition will be expatiated upon, over again; but the rest of the company are enthralled by the melody. Jenny is lying on the sofa with her eyes closed, in silent ecstasy, for the voice and the instrument are both perfection in their way; Mrs Campden and Mary give still more demonstrative signs of approval; and Mrs Dalton has yet an added bliss as the mother of the singer. Every now and then, however, she steals a glance at her husband, and then that look of maternal triumph fades away.

‘John, dear, you must be very tired,’ she says tenderly, when the little concert is over and the ladies are retreating: ‘I hope you will not have more than one cigar to-night.’

‘I had some sleep in the train, and feel dreadfully lively,’ he answers, brightening up; ‘and I have got some business to discuss with Holt; so I am afraid I shall not be very early; be sure you don’t sit up for me, darling.’

‘George,’ says Mrs Campden, ‘you hear that Mr Dalton and Mr Holt have private affairs to talk about, so that there is no excuse for you spending half the night in the smoking-room. I am astonished at your permitting Geoffrey to accompany you to such a place at all.’

‘I do it as a warning,’ answers the host; ‘that

he may remark for himself thus early the pernicious effects of tobacco.'

'It is easy to joke upon all subjects; but you are giving him a taste which is deleterious in itself, and which in after-life he will not be in a position to gratify.'

'My dear, he has got it already,' replies Mr Campden, as he troops off with the other males to the divan.

Under the apprehension of punishment, Uncle George would sometimes break into what those who did not know him would deem next kin to rebellion, but which was, in fact, only that state of wildness which prompts a man in for a penny to go in for a pound. There was still a cigar—which habit would enable him to enjoy—between him and the curtain-lecture.

The smoking-room at Riverside was a model of what such a place should be: it was on the upper floor, yet not so high up as to inconvenience those of mature age and impaired digestion who sought it after dinner; its windows commanded a glorious view of hill and river, when to look out was pleasurable; and when snugness and warmth were desirable, it possessed every element of comfort. It had lounging-chairs, rocking-chairs, conversation-chairs; and three sides of the room were lined with books, bound with great elegance, but all of small bulk, so as to be easily held in the hand. It was said by Mr Campden's detractors that his upholsterer had supplied these books with the rest of the fittings; but that was of small consequence, if he had not written them; they were, at all events, far better chosen than what we find on the bookshelves of most smoking-rooms, which are but too often the *Sporting Review*, in fifty volumes, and other kindred works. There was a sunlight in the ceiling, for use on winter-nights; but at present the apartment was lit by shaded lamps, placed on small round tables.

'Well, as these two gentlemen want to talk business, Jeff,' said Mr Campden, as they all lit their cigars, 'you and I will have a turn at billiards.'

The billiard-room and the smoking-room communicated with one another by double doors, one of which was of green baize, and through these the host and his young friend at once disappeared, leaving Holt and Dalton together. They sat down opposite to one another, at a table by the open window, with their legs stretched out before them, and their coffee by their side: to all appearance, a very cosy couple. In front of them rose the crags of Bleabarrow, just silvered by the rising moon. For a minute or two nothing broke the silence save the babble of the river, and the dull and almost noiseless click of the balls in the next room; both men's faces lay in shadow, but it could be seen that Dalton was gazing on the scene without, while Holt's elbow leaned on the table, and his eyes were shaded by his hand.

'This Bampton business is an awkward one for me, Holt.'

'Yes, indeed.'

'I fear it will have a bad effect with some of the doubtful ones. It was so important to appear to be important just at this crisis. And I spoke so confidently about the matter at the Board.'

'You had a right to feel confident.'

'Of course I had. If a score of those fellows had not turned out to be the greatest liars upon earth—Jenkins and Fuller, for example, voted dead

against me, though I had their written promise. I have got evidence against Griggs with respect to Fuller. There never was a clearer case of bribery in this world.'

'You are not thinking of a petition, however, are you?'

'Well, no; that would, under the circumstances, be sending good money after bad.'

'If you unseated Griggs, they would have a shot at you, you mean.'

'Perhaps; though I don't think they would hit me; but the fact is, I have got no money to petition with.'

'The thing stood you in, more than you expected, then?'

'My good sir, it cost me twice as much—three times. When it came to the last pinch, neither of us cared how deeply we were dipped. It was like being "pricked" at whist. I could not have imagined that there was such an excitement in the thing.'

'Many a great family has been crippled for generations, my dear Dalton, at the same game.'

'That is no sort of consolation to me.'

'Of course not; I only meant that you shewed no unsound weakness in putting the pot on; that you have nothing, in fact, to reproach yourself with.'

'Nothing? Yes, I *here*, Holt. It was not ambition, it is true, that sent me down to Bampton, but it was a piece of business of a very speculative kind. I feel that now, when the thing has gone the wrong way, I do assure you. Mind, I don't blame you, but I ought never to have risked it.'

'Indeed, my dear Dalton, you should not blame me: my ideas, as you know, by no means coincided with yours upon the matter.'

A short sharp laugh broke from Dalton's lips. 'You are not going to say that you always advised me not to go to Bampton, and prophesied what would come of it, are you?'

'Not at all, my good friend. But I protest against being considered the cause of your calamity. For my part, I thought your election a certainty, and, considering your position and prospects, well worth any reasonable sum. *Voilà tout*.'

'Let's stick to plain "English,"' answered Dalton sharply, 'which anybody can perceive is your mother-tongue.'

Mr Holt's pronunciation of the French language was imperfect, and the way he threw his hands out in deprecation of his friend's remarks was certainly not a good imitation of continental 'action'; but the reproof seemed unnecessarily severe.

'It is plain that you are out of temper, Dalton, and, therefore, unfit to discuss business matters, else I had something serious to say to you.'

'That is, you have some bad news to communicate.'

'I am sorry to say I have.'

'Well, spare me it to-night, at all events. I beg your pardon, Holt, if I said anything offensive; but the fact is, I hardly know what I say. When I think of what this abominable election will cost me—close upon four thousand pounds.'

'*What!*' exclaimed the other, in horrified accents.

'Not a penny less, upon my honour. I say, when I think of the money I have thus flung away for nothing, and *what* money, I feel as though I could blow my brains out—that is, if I have any

brains, which, after such a piece of folly, may well be doubted. I felt ashamed, when I came back to-night, to look my own wife and children in the face.

'Yet, you were doing what you thought the best you could for them.'

'No, I wasn't,' answered the other impetuously. 'I was gambling with the money I had stolen from them, in hopes to get it back again; just as the shop-boy does who robs his master's till; and then, to make restitution, goes to a betting-office and backs the loser.'

'Nay, nay; you stole nothing, and have robbed nobody, Dalton; so much, at least, you may comfort yourself with, under all circumstances. What you have done was at worst an error in judgment.'

'An error that will bring down those belonging to me, however,' went on the other vehemently, 'from competence, to what, by contrast, they will feel as poverty. What a dolt, what an idiot, I have been! To imagine that I was fitted to become a Leviathan of the City; that I could make a colossal fortune by mere wits and common honesty.'

'You have been honest enough, Dalton,' answered the other dryly; 'and that, as I say, should always be a comfort to you.'

'Comfort! How can you talk such stuff as that, when I tell you what has happened. You have no ties, no responsibility of your own, or you could not do it. I tell you, when I have paid this Bampton bill, I shall have frittered away, from first to last, three-quarters of my fortune--nay, of my children's fortune. I don't know what your bad news is, though I suppose it is more trouble about the Board; and if I lose my directorship--which, with this fiasco at Bampton, is more than likely--I have only one good horse left out of the whole string--the *Lara*. I snatched a look at the paper yesterday, and found the shares steadily rising. If that goes on, I may still recoup myself. I am bound to say, you did shew good judgment there, Holt.'

'To buy, and then to sell out; that is what I did.'

'I did not know you had sold out; but, at all events, you must have made a pretty penny.'

'Dalton,' said the other gravely, 'my bad news is about the mine.'

'The mine!' exclaimed the other, starting from his seat, and turning deadly pale. 'The *Lara*? You don't mean to tell me that anything has happened to that?'

'I got this from my clerk this morning,' replied Holt, producing one of the little notes, with the contents of which we are already acquainted, from his pocket. 'Of course, things may not be so bad as they seem.'

Dalton snatched the slip of paper from his hand, and read aloud: '*Mem.—Brooks has cabled as follows: "Sell Lara: whole concern a plant."*

'Brooks; who is Brooks?'

'He is the local agent at St José. The news is but too true, I fear. Brand is very careful.'

'Good heavens! you talk as if I had but fifteen pounds at stake, instead of fifteen thousand. A plant? That means a swindle. Did you *know* it was a swindle, sir?'

'I will not answer such a question, Dalton: I can make every allowance for your excitement, but I will not submit to insult. I believed in the

mine as much as you yourself did, up to six hours ago; and I had at one time almost as much money in it as you had. I always warned you to be content with a good premium, and to realise.'

Dalton did not appear to hear him, but kept his gaze still fixed upon the memorandum, with its few fatal words. '*Sell Lara*. What does the man mean by that? How can I sell them when I know the scrip is but blank paper?'

'Just so; and especially when everybody else knows it. But Brooks is Brazil-bred, and has a Brazilian standard of commercial life. It is too late, of course, to do anything of the sort, even if you would. There have been other telegrams beside this man's: I read in the City article of the *Times*—it lay within your reach in the drawing-room to-night, and I trembled lest you should have cast your eye upon it—that the shares had become unquotable.'

'Fifteen thousand pounds,' groaned the unhappy Dalton; 'and four thousand this week! Alas, alas! they will have nothing to live upon—my poor, poor darlings!' It was strange to see how the loss had stricken him. The lines in his face seemed to have already deepened, and of the gay *débonnaire* expression that had so characterised his features there was nothing left. Holt too was by no means unmoved. His face had paled, and if there was no pity in his eyes, that may have been through their incapacity of expression; his tones had pity in them as he replied: 'They have a friend in me, Dalton, please to remember—if I may venture to say as much. Whatever I can do'—

At this moment there was a knock at the billiard-room door, evidently administrative with the butt-end of a cue; and Mr Campden's voice was heard bidding them good-night.

'I won't disturb your confab; but I'm off,' he said, rather lugubriously; for his time was come when he must need suffer avenging fires for the transgressions of the day.

Dalton waved his hand impatiently; and Holt, understanding the gesture, answered for him: 'Good-night.' He waited a little for his companion's acknowledgment of his offer of friendly aid, but since the other did not speak, he again addressed him: 'What I wished to say to you, Dalton, is, that I am a rich man. I got "a pretty penny," as you have suggested, by selling out of the *Lara*, as I wish from my heart that you had done; and my purse was tolerably well lined before. I beg to offer it—to any reasonable extent—at your disposal; to assist you, and those dear to you—Nay, I mean no offence'—

'There is offence,' exclaimed Dalton vehemently: 'everything from you is an offence just now. One thing only you can do—this moment—for which I will thank you.'

'Consider it as already done; what is it?'

'Leave me.'

Holt rose at once. 'You will shake hands, Dalton, at least. Though things have gone wrong with you, it is not my fault.'

Dalton neither moved nor spoke; but his eyes still fixed upon the crags without, looked fierce and hard.

'You will think better of this as regards myself, to-morrow, old fellow; I make every allowance for your feeling sore with everybody at this moment, even with a true friend.'

He threw a sharp glance round the room—the tables, the mantel-piece, the very book-shelves were all swept by it. 'Thank goodness, there are no weapons about,' he murmured; then softly closed the door, and left the ruined man to his own thoughts.

MYSTERIOUS DISAPPEARANCES.

STATISTICIANS assure us, that did we know the exact number of persons who annually disappear from the view and knowledge of friends and foes alike, and of whom no traces are ever obtained, we might well stand aghast, not only at the terribly long list of lost and missing individuals, but also at the seeming futility of the best directed efforts for seeking and finding them. A glance at the 'agony' columns of our daily newspapers, or the notice-boards of police stations, will indeed shew us that the mere disappearance from home of individuals is by no means a rare occurrence; and in many of these cases, very plain reasons for the absence of the runaways may be at least guessed at or supposed. But the cases we more especially allude to are instances of the regular 'mysterious disappearance' class, in which, for the most part suddenly, and in every instance without any reasonable or sufficient cause or excuse, individuals disappear from home, from their business haunts, and from the circle of their acquaintances, and leave not the slightest trace of their whereabouts or intentions. Even what we may call the ultimate fact of their death, is in the vast majority of cases never asserted or proved; and the friends of such waifs and strays of society have not, as a rule, even the melancholy assurance or satisfaction of knowing that the further hope of finding the lost is utterly futile and vain. And thus the date of the disappearance in time becomes one which, as days, weeks, and years roll by, carries with it the ever-increasing remembrance of an event at once sad and terrible in the doubt and uncertainty which enshroud it.

To the question, 'What becomes of them?' detective science may hazard in answer some speculations and several ingenious theories, fitting more or less exactly the ascertained facts of each case. But such speculative philosophy is useful only as a guide to the inquirers, and can afford but little help in framing a decisive answer to the above query. It has happened, however, that in some few notable instances, the science of the medical jurist has aided, in the most powerful and satisfactory manner, in elucidating the history of disappearances, through its testimony to the identity of discovered remains with the presumed missing subjects. And no records of fiction could shew more interesting or startling illustrations of the tangled nature of evidence, and indeed of human affairs generally, than the records of medico-legal experience in respect of the light which science brings to bear on questions of the likeness and identity of the dead with that of the once living. We thus may find, in a somewhat roundabout manner, one

answer to the query regarding the whereabouts of missing men and women; for when death claims such, it frequently devolves on the man of science to say whether the body is or is not that of the missing person concerning whom society, as represented by the family or by the law, may have made much and anxious inquiry.

The notable case of Eugene Aram furnishes, for example, a case in point. The deceased or murdered man, named Daniel Clarke, a shoemaker of Knarborough, disappeared suddenly in the month of February 1745; and on no reasonable and satisfactory hypothesis could his absence be accounted for. Thirteen years afterwards, when the disappearance had well-nigh been forgotten, the discovery of some human bones in a cave near Knarborough, together with some suspicions which had been aroused by the words of one Houseman, Aram's accomplice, brought the occurrence again before the notice of the public. And as is well known, the discovery of a second skeleton bearing marks of violence, as indicated by Houseman's confession, resulted in the apprehension of Aram, and in his being arraigned at York, in August 1759, for the murder of Clarke.

Thus the chain of circumstantial evidence was so far strengthened, and the crime traced very near to Aram's door. And yet the most important links in the chain were supplied by the evidence of the medical jurists, as tending to prove the correspondence of the remains with those of a man of Clarke's age and appearance. Aram's defence, singularly able and lucid, did not avail him against the testimony of the anatomical data of the last century. Thus his allegation that the skeleton was that of a female, was entirely disproved by the medical evidence; and this evidence also tallied in a singularly complete manner with the account given by Houseman of the manner in which the murder was committed. So far, therefore, as testimony corroborative of the facts brought out by ordinary witnesses was required to substantiate the identity of the remains, medical science lent its powerful aid in clearing up this example of a mysterious disappearance.

Whilst the work of the man of science in this respect can never be said to vary in importance, it may nevertheless exhibit very great variations in the manner in which it is carried out, and in the points to which its attention is more specially directed. A very noteworthy case, startling to excess in some of its features, was tried in London in 1831, and rested, so far as the identity of the subject of the trial was concerned, on the presence of the *front teeth* in a very old woman. This woman, Caroline Walsh by name, consented, after much persuasion, to live with a female friend named Elizabeth Ross, and her husband, in Goodman's Fields. Walsh arrived at that place on the night of 19th August 1831; and from that date disappeared completely from public view. Inquiries immediately made by the relatives of the missing woman, resulted in their ascertaining from Elizabeth Ross that Walsh had gone from home on the day of her disappearance, and had never returned.

On the evening of 20th August, or that of the day

following the disappearance, an old woman, who gave her name as *Caroline Welsh*, an Irishwoman like the missing woman, and corresponding in most particulars to the description given of the latter, was found in a destitute and almost dying condition in the neighbourhood of Goodman's Fields. She was conveyed to the London Hospital, and it was there ascertained that she was suffering from fracture of the hip-joint. Her injuries proved too much for her reduced condition, and she died in hospital, and was duly buried therefrom.

When Ross was arrested on the charge of murdering *Caroline Welsh*, she at once said that the woman who had been conveyed to the London Hospital was her old friend; and although her statement seemed plausible enough at first sight, it was found to be decidedly inconsistent with facts, when subjected to due scrutiny and analysis. Then also, direct evidence of the murder of *Welsh* by Ross was forthcoming from Ross's son, who testified to witnessing the suffocation of *Welsh* by his mother; to seeing the body of the murdered woman lying, on the morning of the 20th August, in the cellar of the house in Goodman's Fields; and also to seeing his mother leave home on the evening of the 20th carrying a sack, which apparently contained something heavy.

The accidental presence of a *Caroline Welsh* thus complicated this case of mysterious disappearance in a most curious manner; and the complication was rendered all the more intricate, firstly, by the fact, that no body corresponding to that of the missing woman could be found in any of the London dissecting-rooms; secondly, by a similarity between the dress of the missing woman and that of the hospital-patient; and thirdly, by both women having possessed baskets (in which they hawked smallwares) exhibiting a close likeness to each other, although that of *Welsh* had no cover, whilst *Welsh's* basket had a lid. Thus, to similarity in name, in dress, in occupation, and in certain possessions. And although strict inquiries revealed differences in the habits, physical appearance, and bodily conformation of the women, and in their respective birth-places, yet obviously the case was one in which, unless additional evidence was forthcoming either to confirm or refute the doubts as to the identity of *Welsh* with *Welsh*, the prisoner Ross would clearly profit by the conflict of evidence, and the ends of justice might ultimately be defeated.

One remarkable circumstance in the history of the murdered woman at length assumed the position of a crucial test. It was conclusively proved that *Caroline Welsh* had very perfect front teeth—an admittedly unusual feature in an aged woman. *Caroline Welsh*, on the contrary, had no front teeth; and, moreover, as was proved by an examination of her body, the sockets of these teeth had obviously been obliterated—through the modifying processes which are well known to occur, especially in the aged—for a very considerable period. The scientific evidence clearly established this latter fact in the history of *Caroline Welsh*; and as the existence of the prominent front teeth in *Caroline Welsh* was as firmly established, the guilt of the prisoner Ross was brought home to her—although, indeed, the fate of her victim remained a mystery more easily guessed at than solved.

Sometimes the researches of the scientist actually in the first instance lead to the clearing up of a disappearance. Thus, the examination of a skeleton found deeply imbedded in the sand of the sea-coast at a certain Scotch watering-place, shewed that the person, when living, must have walked with a very peculiar and characteristic gait, in consequence of some deposits of rheumatic kind, which affected the lower part of the spine and pelvis. The mention of this fact induced a search through some old records of the town, and resulted in the discovery that a case of mysterious disappearance had been duly noted; the subject being a person whose mode of walking had made him an object of attention, and whose fate, but for the observant eye of the anatomist, might have remained wholly unknown.

One of the most famous cases in which medical science has aided the effects of the law in determining the identity of human remains, was that known as the *Waterloo Bridge Murder*. This case excited much interest and curiosity at the time (1857); and (as in a crime of the most recent date) the chain of circumstances which led to the discovery that a murder had been committed, shrouded the matter still more impenetrably in mystery. A carpet-bag which had been dropped over *Waterloo Bridge*, London, with the obvious intention of disposing effectually and silently of its contents in the *Thames*, landed instead, on one of the buttresses of the bridge, a few yards above the current. When examined, the bag was found to contain portions of a human body, the pieces, consisting of bones with flesh attached, numbering twenty-three in all. It formed an important object of inquiry to ascertain whether the identity of the remains could be determined, with a view to connect them firstly with any known case of mysterious disappearance; whilst their due examination might in the second instance lead to the discovery of a crime, by affording some clue as to the probable nationality, rank in life, profession, or trade, general circumstances, and mode of death of the victim.

Pieced dexterously together by medical experts, the portions contained in the bag were found to be those of one and the same body; but the head, a large portion of the spine, the hands and feet, and some parts of the chest, were wanting—these missing parts being exactly those by means of which the human subject is usually and most readily identified. But notwithstanding these serious gaps in the continuity of its structures, the mutilated frame was discerned to be that of a full-grown man, whose height must have been at least five feet nine inches. To this first conclusion the experts were led by careful measurements of the existing parts of the skeleton, together with relative measurements in place of those parts which were wanting. The body was further found to present no peculiarities, the result either of natural malformation or diseased action, whereby any clue to its more particular identity—as in our preceding example—could be obtained; but it presented evidence to shew that the remains were those of a man of very dark complexion, the hair covering the body being of a black colour. The examination detected the presence of a stab or punctured wound in the left side of the chest, between the third and fourth ribs; and what perhaps formed the most important result of the

inquiry consisted in the fact, that the experts were able to pronounce, from the characters of the wound, that it had been inflicted, in all probability, during the life of the individual. The surrounding highly suspicious circumstances of the occurrence, undoubtedly favoured this latter supposition; whilst the clumsy and unscientific manner in which the remains were mutilated—the bones being *sawn through* near the joints, instead of being disarticulated at the joints by the simple division of the ligaments—shewed that no theory of the remains having formed the subject of anatomical research, could for a moment be entertained. The probable date of death was also in some degree fixed; the examiners being led, from the appearance of the remains, to state with certainty that they had been dead for at least three weeks before the date of the examination, which was conducted on 21st October 1857.

Thus the medical evidence elucidated a number of facts, which, taken together, afforded a useful commentary and test of the value of other and purely circumstantial evidence. The articles of dress which were inclosed in the bag along with the remains, were of foreign make, and were cut and torn in numerous places. No definite clue was ever obtained which could lead to the detection of the murderer, or of the motives which prompted the crime. The remains were thought to be those of a Swedish sailor, whose disappearance might cause little or no stir even amongst his associates; whilst the mere fact of his disappearance in a foreign land, would also militate against the chances of his identity being established. A supposition which received much credence at the time of the occurrence, was that which presumed that the deceased, as a foreigner, had in all probability fallen a victim to the assault of some secret society, of which he may have proved to have been an unworthy or traitorous member.

It is by no means an uncommon occurrence to find the remains of the lower animals gravely brought under the notice of the legal authorities, in mistake for those of man; and the skill of the zoologist and microscopist may sometimes be called in to aid in the unravelling of some complicated cases; whilst, as exhibited in the Waterloo Bridge case, even the question of race or nation—only to be authoritatively determined by the ethnologist or naturalist—may involve considerations of the utmost import in accounting for or explaining some cases of identity and disappearance.

The subject before us is not without its ludicrous aspect, in respect of the mistakes which are sometimes committed, and of the excitement created by the supposed discovery of human remains under highly suspicious circumstances, when in reality the remains are those of animals, sometimes of very inferior structure and grade to man. A short time ago, a case of what was at first believed to be atrocious murder, and in which the body was believed to have been disposed of by burning, was quietly settled by the medical examination proving that certain incinerated skull-bones were those of a *sheep's head*; whilst in another case, which occurred in London in 1838, the usual amount of wild speculation was excited by the discovery of what was supposed to be a human hand in a City dust-bin. The excitement attending the discovery, however, was timeously quieted by the assurance from reliable authority, that the

supposed hand was in reality the paddle or forelimb of a *turtle*, which doubtless had perished in a manner perfectly consistent with the demands of justice and good taste.

THE MONTH:

SCIENCE AND ARTS.

THE Lords of the Treasury, with a commendable regard for economy, have appointed a Committee to look into the Meteorological Office, and inquire whether the ten thousand a year voted by parliament for that establishment is well spent or not. The chief points for inquiry are: Has the great mass of observations hitherto collected led to the discovery or confirmation of meteorological laws? Has any good come from the storm-warnings? In case these two questions are answered in the affirmative, there come up next: Are the results worth the large sum which they cost annually? and, On what system should the office be carried on? And further, would it not be possible to spare a portion of the annual ten thousand pounds for the Scottish Meteorological Society? This, translated out of official language, is to be the scope of the inquiry. It is wide enough to embrace all that can be said on the subject of government aid to meteorology, whether for or against. If the aid is to be continued, we hope the claim of Scotland will be properly considered. Readers of this *Journal* are already aware that the Scottish Meteorological Society have done and are doing excellent work.

An attempt has been made to get up a sensation about the Polar expedition by suggestion that the ships are exposed to unusual risk, that it is indispensable to communicate with them next spring, and that the crews are entitled to special rewards in addition to the double pay they are now earning. The truth of the matter is that there is no occasion for alarm. The ships are so thoroughly equipped that they may stay out three years and keep all hands in comfort.

The Royal Society opened their session with a further Report from the *Challenger*, which informs us that, in addition to discoveries on land and water, the exploration of the sea-bottom is still carried on. The science of geology and of natural history has profited largely, and when the enormous collection of specimens already sent home, with those that are to follow, shall have been examined and reported on, it will be seen that in scientific results the voyage of the *Challenger* excels all others. Another paper, on the Physiological Action of Vanadium, by Mr Priestley of Manchester, shews that the peculiar metal in question has properties which 'act upon the central system of the spinal cord and medulla oblongata,' and may thus become useful in medicine. Dr Tyndall marked the new year by reading to the same Society a paper on 'The Optical Department of the Atmosphere, with Reference to the Phenomena of Putrefaction and Infection.' He delivered it also as a lecture at the Royal Institution. The subject is interesting and of high importance; but for the present we

can only state that it proves to absolute demonstration that putrefaction cannot go on in air perfectly filtered; that is, entirely free from floating particles, or 'moteless.' In no instance did any sign of life appear in the infusions shut up in a chamber of moteless air.

The Royal Agricultural Society have just published number twenty-two of the second series of their *Journal*, full, as usual, of valuable articles, among which is one on that much-dreaded pest the Colorado Potato-beetle, by Mr H. W. Bates, F.L.S. This article is the more instructive as it has a coloured plate shewing the beetle in various stages of its existence; and it is easy to see that in each and all of those stages there can be no concealment, for the creature is conspicuous by its bright colours. Mr Bates gives a summary of its history and habits, of the natural and artificial means by which it may be destroyed, and shews reason for believing that its introduction into England is hardly probable. It is possible, he says, that a few stray specimens may arrive; but the creature's habits and transformations are such as to lead to speedy detection. In Southern and Central Europe, where the climate more nearly resembles that of the native country of the beetle, special precautions may be necessary. But, to quote Mr Bates, 'American potatoes are imported into Britain only for seed-purposes, and in remarkably clean condition. Newly arrived casks which I saw opened contained not a particle of refuse, and no pellet of soil large enough to conceal a hibernating beetle.' If, however, beetles should fly on board ship in the harbour of New York, and find a snug lodging for the voyage, they might fly off at Liverpool. Even in this case, Mr Bates thinks 'there is little probability of their propagating and spreading in this country.'

'On a Method of obtaining Motive-power from Wave-motion,' is the title of a paper published in the *Transactions* of the Institution of Naval Architects. The author, Mr Tower, has studied the action of waves, and found it to consist of two elements, a back-and-forward motion, and a rising and falling motion; and he shews theoretically that a heavy weight may be so suspended on board a ship that it shall be set in motion by the movement of the waves, and thus become the moving-power of machinery to propel the vessel. 'The quantity of power to be obtained under such conditions,' says Mr Tower, 'would be simply and directly as the distance through which the weight moves. The fact that external force would have to be used to compel the weight to move through a greater distance than it would otherwise move through if left to itself, does not in any way alter this fact; for, theoretically, no power would be lost in causing the weight to oscillate through a great or any distance. All the energy consumed in the acceleration of the weight would be completely returned during its retardation.'

A working model tried in Torbay, demonstrated the truth of the theory, and if sea-waves were always uniform in height and length, there would be but little difficulty in working it out to a satisfactory solution. But it is believed that the difficulty occasioned by irregularity of wave-motion may be overcome; and Mr Tower shews that an ordinary sailing-ship of eleven hundred tons displacement when loaded, provided with a swinging weight of one hundred tons, could be

driven through the water by a screw propeller worked by the revolutions of the weight. Suppose a ship so constructed to meet, outward-bound, a south-west gale at the mouth of the Channel, where waves roll eighteen feet high and five hundred feet long—'Instead,' says Mr Tower, 'of beating backwards and forwards under reefed top-sails and foresail, losing ground every tack, our wave-power ship would be able to put her head to the sea like a steamer, having actually in such a sea six hundred horse-power at her command, which would enable her to go ahead in the teeth of the gale, and secure a good offing.'

In the open sea, and with moderate head-winds, the ship would make nearly seven knots an hour. When winds blow fair, the revolving weight would be secured, and sails would be hoisted. In the belt of calms on the equator, about three hundred miles wide, known to seamen as 'the doldrums,' there is commonly a smooth swell of waves three feet high, which would suffice for a speed of between four and five knots an hour, whereby the belt would be crossed in less than three days.

As our readers will remember, this is not the first time that the notion of getting power out of waves, or out of the rise and fall of the tides, has been mentioned in these pages. There is something eminently gratifying in the thought of making head-winds help ships on their way, so that in a voyage to Australia or the Pacific they should be always going ahead. Mr Tower estimates that in the whole voyage the weight and the machinery would be working perhaps forty days. Competent judges think that his views admit of practical application. A trial will most likely be made. We shall gladly assist in making it known when successful.

In a recent address to the Newcastle-on-Tyne Chemical Society, the President, Mr Pattinson, stated that Körting's steam-jet apparatus is extensively applied to various purposes in chemical works and other factories in this country, on the continent, and in America. It consists of 'a jet of high-pressure steam applied somewhat like a Gifford's injector, through a series of conical tubes, for the purpose of moving or forcing gases and liquids in any required direction. It has been used to force air through the gas-producers in connection with a Siemens furnace, through the fires of ordinary steam-boilers, in the ventilation of workshops, mines, drying-rooms, and other places, as an exhauster in gas-works, and is to be applied to the carbonating and other furnaces of chemical works in the Newcastle district.' Its effect on an ordinary steam-boiler fire is a great economy of fuel; and a case was mentioned of a Root's boiler and a Cornish boiler which in two hundred and thirty hours, or twenty consecutive days, consumed (omitting fractions) seventy-eight tons of coal in raising the steam required for the works; but which, when the Körting apparatus was fitted, consumed not more than thirty-six tons in the same space of time, and did the same amount of work with the Root's boiler only.

Mr Clapham, a member of the same Society, gave an account of his visit to soda-works in France, in which he found much to praise. In England, owing to the high price of labour, the quantity produced is more regarded than the quality. 'On the other hand,' remarks Mr Clapham, 'the French, with their dear materials, their

small but many times multiplied apparatus, the constant application of the chemical laboratory to every process, the cleanliness and care of their frugal and saving workmen, are producing chemical products which, although in nearly all cases dearer than in England, are certainly of superior quality, from which the English manufacturer may take a lesson.

Manchester has a Scientific and Mechanical Society, at which descriptions are given of new inventions. A recent one is the use of sound for telegraphic purposes. In this case a steam-whistle is made to deliver long or short sounds at pleasure (as the Morse telegraph makes dots and dashes), and these being combined according to a pre-arranged code, it follows that messages may be sent from ship to ship at sea, or from a ship to the shore. In a fog, every ship would be able to make known her position to the others, and what she was doing, which would be a safeguard against collision. And it is obvious that, even in clear weather, much time would be saved by whistling a message instead of sending it by a boat, considering that the whistle can be heard at a distance of three miles. Apart from ships, it is easy to imagine many cases in which a talking telegraph would be useful; and we are told that the practicability of the invention was demonstrated by sending 'several verses of poetry' into a lecture-room from a whistle at a distance.

Another invention which should be interesting to weavers everywhere, is Bowker's patent self-acting punching-machine for repeating Jacquard cards. In the ordinary machine, a skilled workman must be employed during three weeks or a month to fit it up and get it into working-order. The new machine, which can be packed in a small box, is always ready for working, and will prepare from twelve to twenty thousand of the perforated cards in a day; while the old process will not produce more than twelve hundred. Another advantage consists in the rapidity with which changes of fashion may be followed: 'A manufacturer will bring out new designs for each season, and if any of them meet with success, he will frequently be able to take large and remunerative orders, if he can execute them with despatch. Aided by the machine, he can get cards for a large number of looms in a day or two, instead of being weeks over them, as on the old system, and can thus start his looms quickly, and send his goods into the market in time for the season.'

We learn from an address delivered to the Horological Society by Sir E. Beckett, that the great clock at Westminster is the best clock in the kingdom—that each dial has four hundred square feet of surface—that the minute hands are eleven feet long—that, although the hands are all counterpoised, the entire weight of hands, counterpoises, tubes, and wheels, having to be moved at every beat of the pendulum, is not less than a ton and a half (this, of course, includes the four dials)—that the going weight is one-and-a-half hundredweight, and the clear fall one hundred and seventy feet—and that the winding-up, which takes five hours, is done by hand. According to the annual Report of the Astronomer Royal, the time kept by Big Ben shewed an error of less than a second on eighty-three per cent. days in the year. The notion that this clock is 'always behind' is therefore erroneous.

It is a common saying that everything we eat or drink is adulterated. Watchfulness in buying is therefore highly necessary. We learn, from a statement in the *Journal of the Chemical Society*, that sham coffee is manufactured from tough dough, squeezed into little moulds, and baked until the colour becomes dark enough to deceive the eye. Real coffee-berries when small and worthless are improved in colour by rolling them about with leaden bullets in a cask. The green berries too are treated by a colouring matter. In coffee sold ready ground, the difficulty of detecting adulteration is greatly increased; beans, beet-root, carrots, and carrot-like roots, are roasted and mixed in large quantities with the genuine article. In the south of Europe, especially in the provinces of Austria, figs are roasted in enormous quantities and sold as coffee.

A ready test of ground coffee is to shake up a spoonful in cold water. If it be genuine, it will remain floating a long time; whereas chicory and some other preparations sink immediately.

A contemporary suggests that the health of sailors and the comfort of life on board ship would be promoted if the practice were introduced of eating the rats which swarm in most ships. In China and some other parts of the world, rats are part of the daily food of the people, and an instance is given of a shipmaster who eats a roasted rat every morning at breakfast. We shall be glad to receive opinions from those who have tasted this generally despised rodent. Perhaps Mr Frank Buckland could say.

Measures are in progress for a renewal of the so-called Sub-Wealden boring, by which, as some readers will remember, it is hoped that an important geological problem may be solved. The problem briefly stated is this: In France and Belgium there are certain Devonian and Carboniferous strata found in a wavy form, with prolongation towards the west, where they are covered by chalk and the sea. It is believed that they extend under the Channel and the south of England, concealed by other formations, until they reappear in the coal-bearing strata of Somersetshire. If this be true, as is maintained by some of our ablest geologists, there must be seams of coal underlying a breadth of country all the way from Namur to the Mendip Hills; and it is with a view to discover this coal, and explore the strata generally, that the deep boring was undertaken, and is now, after six months' pause, to be resumed. It has been aided by grants of money from the government, the Royal Society, and private individuals, and deserves the success which in many quarters is earnestly hoped for.

The Indian government are about to establish at Simla an observatory for the observation of physical phenomena, under the direction of Colonel Tennant, F.R.S., an able scientific officer. There are certain observations which can be made with advantage only in a tropical climate and at a high elevation; and this is especially the case with observations on the heat of the sun. There is strong reason for believing that the sun's heat varies from month to month and from year to year; and it may be that there is a periodicity in the heat as well as in other solar phenomena. The new observatory may, therefore, be inaugurated with plenty of work.

ODDLY ADDRESSED LETTERS.

A NUMBER of years ago, a post-letter arrived in Edinburgh, addressed in foreign handwriting to 'M. TOMPITS, Edinbourg.' As no special direction was given, the post-office officials were at a loss to understand who this M. Tompits could be. As far as known, there was no such person in the town. At length, by pondering over the matter, and judging from the sound of this extraordinary name, it was discovered that the letter was intended for our old and esteemed friend, Mr Thomas Potts, ordinarily and jocularly called Tom Potts—alas, now deceased, but remembered for the geniality of his character. The letter was from a foreigner to whom he had shewn some kindness, but who had understood his name to be simply Tompits.

It is mentioned that something of the same kind once took place regarding a letter which arrived by post in London, directed to 'SROMFRIDEVI, Angleterre.' There was no such person as Sromfridevi ever heard of; but on a little consideration, and judging from sound, it was obvious that the foreign writer of the letter meant Sir Humphry Davy; and this proved to be the case.

We are reminded of these amusing incidents by an article in a late number of one of the London newspapers, the *Daily Telegraph*, referring to the introduction of 'Spelling Bees,' as a means of an instructive evening amusement. A 'Bee' is an American term for an assemblage of acquaintances to execute some piece of work, such as sewing articles for a newly married couple, or for some social amusement in which the quality of amusement or mutual instruction is concerned. A 'Spelling Bee' signifies a competition in spelling words, the best spellers being rewarded with suitable prizes. Spelling Bees are, no doubt, a little childish and ridiculous, but looking to the number of badly addressed letters, and the bad spelling that one occasionally meets with, we do not think that Spelling Bees are to be at all discommended. We would simply suggest, by way of supplement, that besides a competition in spelling, there should be a competition in the art of directing post-letters in a manner that is clearly intelligible; so as, if possible, to give less trouble to letter-sorters and letter-carriers. This brings us to a circumstance mentioned by the London newspaper above referred to.

Following the example of the English General Post-office, the French Administration des Postes maintains a staff of "blind clerks"—that is to say, caligraphic experts who are supposed to be able to decipher the most illegible handwriting, and to deduce sense and meaning from the apparently hopeless chaos of orthographical blunders. Some years since there was returned to the French Dead-letter Office an epistle which had gone the round of every seaport in the Levant, and the ambiguity of whose superscription had baffled a legion of postmasters. It was addressed "J. DUBOIS, Sultan Crete." Now, what could this mean? The suzerain of the island of Crete is the Sultan of Turkey, but his majesty's name is certainly more like Abdul Aziz than J. Dubois. Five out of the six blind clerks in the Rue Jean Jacques Rousseau confessed their entire inability to solve the mystery of Dubois, who, on the face of the envelope at least, was proclaimed a Cretan sultan. But to the sixth among the band of experts there suddenly occurred

a happy inspiration. "Fetch me a *Navy List*," he said to a subordinate. The *Annuaire de la Marine* was brought. The expert looked up *Sultan*, but alas! there was no ship bearing that name in the French navy stationed at Crete, or anywhere else. The wary cryptographer capitulated for a time, still turning over the pages of the *Navy List*. At length he rose triumphant to the occasion. "I have it," he cried: "this letter is addressed to J. DUBOIS, sur le *Tancrède*;" and to M. Dubois, who was a quartermaster on board the good ship *Tancrède*, on the Pacific station, the letter was duly forwarded. The missive was from the quartermaster's brother, whose education, so far as regarded spelling, had seemingly been of a strictly phonetic nature, and who had written down his relative's address, not in accordance with the commonly received doctrines of orthography, but just as the words had sounded to his ear.

MY NATIVE BAY.

My native bay is calm and bright,
As e'er it was of yore,
When, in the days of hope and love,
I stood upon its shore!
The sky is glowing, soft and blue,
As once in youth it smiled,
When summer seas and summer skies
Were always bright and mild.

The sky—how oft hath darkness dwelt,
Since then, upon its breast;
The sea—how oft have tempests woken
Its billows from their rest!
So oft hath darker woe come o'er
Calm self-enjoying thought;
And passion's storm a wilder scene
Within my bosom wrought.

Now, after years of absence, passed
In wretchedness and pain,
I come, and find those seas and skies
All calm and bright again.
The darkness and the storm from both
Have trackless passed away;
And gentle as in youth, once more
Thou seem'st, my native bay!

Oh, that, like thee, when toil is o'er,
And all my griefs are past,
This ravaged bosom might subside
To peace and joy at last!
And while it lay all calm like thee,
In pure unruffled sleep,
Might then a heaven as bright as this
Be mirrored in its deep!

ROBERT CHAMBERS, 1823.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.
- 4th. MS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

STORY OF THE ASTORS.

A HUNDRED years ago, there dwelt in the village of Waldorf, near Heidelberg, a peasant named Astor. He was married, and along with his wife and grown-up children, he toiled for a livelihood in the neighbouring fields. Waldorf was one of those quiet German villages which never seem to undergo any sort of change, and where, from the absence of stir, you might imagine that the inhabitants are asleep in their sun-baked dwellings. They are, however, anything but asleep. At early morn, they may be seen trudging forth in family groups, to their daily labour in the fields, where, drudging till nightfall, their only food is of the humblest possible description—a lump of brown bread, or so, with at the best a little milk, or a mouthful of very poor wine. An honest, hard-working set of people they were, and still continue to be, many of them being descendants of those unhappy inhabitants of the Palatinate who suffered so greatly during the devastating wars in the seventeenth century.

Astor, the father of the family, appears to have been a man of a pious character, with correct notions of the value of thrift and diligent industry. He had four sons, each of whom was trained to early rising, and taught to devote a certain portion of time to reading the Bible and saying prayers before going forth to daily pursuits. So reared, and with encouraging advices from their mother, the boys aspired to rise above the ordinary routine of labour at Waldorf. Two of them left the old home to push their way in the world. Of these, one got employment in London as a maker of musical instruments, for which he had a taste; and the other emigrated to America. The musical instrument maker being successful in his calling, invited John Jacob, one of his younger brothers, to join him, and for the time these two carried on business together. John Jacob Astor, who was born 17th July 1763, was in his sixteenth year when he arrived in London to assist his elder brother. He resided in London for about four years, during which he acquired a facility in

speaking the English language, which contributed greatly to his success in life. The temptations of the metropolis were powerless to divert him from his duties. He rose every morning at four o'clock, never forgot his devotional exercises, and wrought hard at his business. Of an enterprising turn, and with a fancy for emigrating to the United States, then newly established, he sailed for Baltimore in 1783, being then no more than twenty years of age. He carried with him a small consignment of musical instruments—not more, we believe, than five pounds worth of flutes—which he was to try to sell on commission. A chance circumstance led him to abandon the musical instrument trade. On the voyage, he became acquainted with a person who strongly recommended him to exchange his consignment of instruments for furs, and take these to England for sale. Young Astor, on consideration, followed the advice. He sold his parcel of instruments in New York, bought furs, and brought them to London, where they met with a speedy and profitable sale.

This fortunate incident was the turning-point in his fortune. He threw himself with eagerness into the fur-trade, in which, as is pretty well known, from Washington Irving's *Astoria*, he had a remarkable career. Beginning on the narrowest scale, but bringing to his task a persevering industry, rigid economy, and strict integrity, along with a sagacity quick to grasp and convert every circumstance to his advantage, he gradually improved his position, which was at first nothing but that of an obscure citizen in New York. For a number of years he dealt in furs derived chiefly from Canada, to which they were brought by the Indians; but at length, about 1809, he succeeded in establishing an American Fur Company, principally by means acquired by his painstaking industry. The object of the Company was to establish trading-posts along the Missouri and Columbia Rivers, connecting them with inferior posts in the interior, to which peltries could be brought by trappers and Indians. From the main posts on the Columbia River the skins were to be sent by vessels round Cape Horn to New York;

or alternatively, the vessels were to take the furs across the Pacific to Canton, and thence bring Chinese goods to the United States. It was altogether a gigantic undertaking, which involved not only a large sum of money, but prodigious skill and tact as regards management and the employing of a corps of agents of various kinds.

While an expedition was fitted out to proceed by sea to the mouth of the Columbia River, another expedition was set on foot by land and river to travel across the North American continent. The command of this latter expedition was given to Mr Hunt, one of the partners, who was noted for his great ability, coolness, and courage. Mr Hunt set out on this extremely hazardous enterprise in 1810. The first thing he did was to visit Montreal, to pick up recruits, consisting of *coureurs des bois*, or rangers of the woods, and voyageurs, from the disbanded herd usually to be found loitering about the place.

'These men,' as Irving explains, 'would set out from Montreal with canoes well stocked with goods, with arms and ammunition, and would make their way up the mazy and wandering rivers that interlace the vast forests of the Canadas, coasting the most remote lakes, and creating new wants and habitudes among the natives. Sometimes they sojourned for months among them, assimilating to their tastes and habits with the happy facility of Frenchmen; adopting in some degree the Indian dress, and not unfrequently taking to themselves Indian wives. Twelve, fifteen, eighteen months would often elapse without any tidings of them, when they would come sweeping their way down the Ottawa in full glee, their canoes laden down with packs of beaver-skins; and now came their turn for revelry and extravagance.' The kindred class of voyageurs, who also sprang out of the fur-trade, still formed a fraternity who were employed as carriers and assistants in long internal expeditions of travel and traffic, proceeding by means of boats and canoes on the rivers and lakes. 'Their dress is generally half-civilised, half-savage. They wear a capot or surcoat made of a blanket, a striped cotton shirt, cloth trousers or leathern leggings, moccasins of deer-skin, and a belt of variegated worsted, from which are suspended the knife, tobacco-pouch, and other implements. Their language is of the same piebald character, being a French patois, embroidered with Indian and English words and phrases. The lives of the voyageurs are passed in wild and extensive roving, in the service of individuals, but more especially of the fur-traders. They are generally of French descent, and inherit much of the gaiety and lightness of heart of their ancestors, being full of anecdote and song, and ever ready for the dance. They inherit, too, a fund of civility and complaisance; and instead of that hardness and grossness which men in laborious life are apt to indulge towards each other, they are mutually obliging and accommodating; interchanging kind offices, yielding each other assistance and comfort in every emergency, and using the familiar appellations of "cousin" and "brother," when there is in fact no relationship. Their natural good-will is probably heightened by a community of adventure and hardship in their precarious and wandering life. No men are more submissive to their leaders and employers, more capable of enduring hardship, or more good-

humoured under privations. Never are they so happy as when on long and rough expeditions, toiling up rivers or coasting lakes; encamping at night on the borders, gossiping round their fires, and bivouacking in the open air.'

After a variety of adventures in which great hardships were endured, Mr Hunt and party reached the Columbia River, and finally arrived at Astoria, such being the name of what was to be the trading-post of departure by sea. Misfortunes had already overtaken the Company. The vessel despatched by Mr Astor was wrecked, and from fresh expeditions there ensued no practical benefit. The breaking out of the war betwixt Great Britain and the United States was the final blow given to the concern. Fort Astoria fell into the hands of the British; and the American Fur Company thereupon partially breaking up, the trade in peltries was forthwith engrossed by the Northwest Company and other associations. Although Mr Astor's plans had so far proved disastrous, he did not repine, but continued to trade in furs, and to engage in other advantageous enterprises. So realising a small fortune, he began to invest money in the purchase of land in and about New York, the rapid growth of which he foresaw must soon vastly raise the value of real estate. These calculations proved correct. The property he acquired rose in some instances to a hundred times the price originally paid for it. He also erected numerous public and private buildings in a handsome style, which he advantageously let. One way and another, he realised the largest fortune ever, till that time, accumulated in America, amounting to twenty millions of dollars, or four millions of pounds sterling.

As mere money-making is not to be highly commended, the extraordinary success of John Jacob Astor cannot merit anything like a eulogium. We give his story only as offering a remarkable instance of extraordinary shrewdness, and persevering diligence in ordinary pursuits. It is stated that he continued through life to be an early riser, to be scrupulously attentive to his business concerns, and to be noted for fair dealing. So long as he was able, he took daily exercise on horseback. He was by no means stingy in money matters, but contributed pretty largely to charities. Amidst the bosom of his family and friends, he drew out existence pleasantly, and was till the last exemplary as regards religious duties. He died at New York, 29th March 1848, at the ripe age of eighty-five years.

Not till after the death of John Jacob Astor, was the extent of his munificence known. Among the charitable provisions in his will, the first worthy of mention was a bequest of fifty thousand dollars for the benefit of the poor of Wadsworth, his native village, a sum which the Grand Duke of Baden judiciously applied for the instruction of young persons, who would otherwise have been destitute of education. There was a still grander bequest. It was the sum of four hundred thousand dollars—eighty thousand pounds sterling—to found and maintain a public library in New York, where an institution of this kind, if only for general reference, was greatly wanted. Under the management of trustees, the Astor Library, as it is called, was established in a handsome edifice erected for the purpose. The collection of books, drawn from every European country, is much esteemed for its

value in promoting literary study. For this crowning act of beneficence, the memory of John Jacob Astor is worthy of all honour. Let others who have the means, whether in America or Europe, go and do likewise.

The greater portion of the fortune of John Jacob Astor was inherited by his son, William B. Astor, who, following up his father's arrangements, continued to augment his acquired wealth, by sedulous perseverance until his decease, which took place recently, 24th November 1875. William B. Astor is reputed to have had none of his father's daring genius. His life was not devoid of generous deeds, but from the time he succeeded to his father's estate, at fifty-six years of age, accumulation was his absorbing object. The following sketch of the character and career of this second of the Astors, appears in the *Spectator* newspaper: 'He had been trained to watch his father's property, and for the rest of his life he pursued unswervingly a single purpose—that of so managing "the Astor Estate" that it should grow greater in his hands. He was not a mean man, still less a miser, any more than he was a generous one. He thought his father had not distributed quite enough among some relatives, and in a moderate, sensible way, at a cost of a few thousands, he remedied all the deficiencies he perceived. He heard that the trustees of the Astor Library, after their large expenditure on buildings, had hardly adequate funds for book-buying, and he added forty thousand pounds to his father's gift of eighty thousand. He gave, when asked, to charities, and not illiberally; but his usual cheque was one for two hundred pounds, and he is only once recorded to have made a donation of ten thousand pounds at once. He lived also liberally, with a town-house and large country place; but he lived moderately, spending on himself and his charities but a fraction of his income, secluding himself very much from the public eye, and taking no visible part in the business of the city or republic. He never became a director in any of the undertakings in which he held shares. His work for twenty-seven years was merely to manage his property, to cover his father's lands with large houses, till shortly before his death he possessed seven hundred and twenty, most of them of the first class and in the richest quarters, and to invest his yearly accumulations in the safest investments he could find. He never speculated or dealt on 'Change, or went in for grand *coups*, but steadily added house to house and share to share, working all the while as if he had still his bread to make. His office was as large as that of any great contractor, and he superintended it himself, going down every day when in town to business, and keeping all under him at work. He paid well, and he must have had some judgment in men, for he was well served, and had the art of inducing his agents to give up their whole lives to his service. He had, too, a certain fidelity to his work and to the estate, and, we believe, put a clause in his leases under which he alone should undertake all repairs—a branch of work involving excessive labour and no profit. It is probable that while he adhered steadfastly to his own plan of life, and watched his fortune accumulating, he was a weary man, who thought life had very little to give, and had something of a dislike for the wealth which had made him such a name. He seemed to be governed, possibly from habit, by a sense of duty

to the estate which he had watched so long—by a feeling that to diminish it, even for great objects, would be in some sense a moral wrong. It may even be surmised that he was conscious of this feeling, and a little ashamed of it, broader ideas flitting occasionally before his mind. There is something to our ears excusatory in his frequent remark that his wealth brought him nothing but a maintenance and a daily round of work, and the burdensome reputation of being the richest man in the Union. Nevertheless, he never intermitted his toil, but from 1860 to 1873 increased his buildings, till he was popularly described as "the Landlord of New York," and was possessed of a fortune which the *Tribune* says is variously estimated, but may reach ten millions sterling. We have heard it estimated, not by vulgar rumours, but by grave capitalists, who had an interest in knowing the truth, at a very much larger sum; but vast as the transactions of W. B. Astor were, Wall Street is shrewd, and the *Tribune's* estimate is likely to be found, when the property is valued for the succession, the terms of which are still unknown, very near the truth. John Jacob Astor certainly left four million pounds, most of it producing more than six per cent.; and allowing even forty thousand pounds a year for expenditure and management charges, the savings of twenty-seven years under such management as Mr W. B. Astor's, added to the original fortune, cannot amount to much less than ten millions, and may prove to be much more. It is to be observed, however, that the houses will be valued at a period of unusual depreciation. If the amount we have stated should be realised, Mr Astor's fortune was one of the largest ever at the disposal of a single man, unfettered by the responsibilities of a house like the Rothschilds, or by settlements such as reduce the London dukes to life-tenancies.'

As John Jacob Astor named a grandson as one of the Trustees of the Library he founded in New York, we assume that the magnificent fortune left by William B. Astor is duly inherited by this representative of the family. The third of the Astors may be ranked among those extraordinarily rich men whose wealth is reckoned by millions. It is generally stated that the late Mr Astor was the richest man in the States, but we see that this is controverted by the Californians; they aver that the richest is Mr John Mackey, who ten years ago was a working miner, and now owns gold-mines which bring him an income of ten millions of dollars, or two millions of pounds sterling, annually. Be this as it may, it seems to be understood that the representative of the late Mr Astor has inherited property to the value of ten millions sterling. There are rich men in Great Britain, but we fancy none can come up to this. What any one can rationally do with such enormous wealth, would be difficult to say. To disperse it in an extravagant style of living, would be a crime, the height of folly. To give away large sums in charitable donations might have a pauperising tendency, and do more harm than good. Much could certainly be done to public advantage in the sanitary improvement of cities, in helping educational movements, in founding libraries where they are likely to be appreciated, in measures for civilising countries still in a state of semi-barbarism, and in well-conceived scientific enterprises beyond the reach of ordinary appliances.

The very thought of ten millions being accumulated in the course of two generations creates a degree of wonder. Suppose that the sum is not to end there, but to go on accumulating at the same ratio during a third and a fourth generation, the result becomes a little overwhelming. Meanwhile, without going into speculations as to the future, we may hope that a decently good use will be made of the colossal fortune founded by John Jacob Astor, who, at the outset of life, as we have seen, was nothing more than a poor boy in the village of Waldorf.

W. C.

FALLEN FORTUNES.

CHAPTER IX.—WORMWOOD.

FOR many minutes after his companion had left the room, John Dalton sat in the same posture, his hands lying idly before him, and his mind busy with the past. He had been a fortunate man all his life; so his friends said; and up to within a year or two he had had no reason to disbelieve them. He had always had enough for his needs, and for the needs of those he loved, and these had not been of a simple kind. He had never been ostentatious, but he had mingled with the best society without any outward sign of inferiority as regarded means; while in other respects he had stood high in it. His company had been always sought for, but not as that of a mere raconteur and dinner-wit, though he had the name of being such: he had been invited everywhere on equal terms. In such a circle he had had, of course, no reputation for wealth, but his circumstances had been more than easy; he had had no lack of servants and carriages; and if his home entertainments had not been upon so splendid a scale as those of most of his acquaintances, they had been sought after for their intrinsic goodness, as much as for the genial reputation of the host. Mrs Dalton possessed tact, in addition to much better qualities; and though caring nothing for such matters herself, had looked after the little dinners in Cardigan Place with her own eyes, because she saw that her husband wished them to be perfect. She had been an 'excellent manager'—but by no means in the sense used by the compilers of cheap cookery-books. She had taken care in the first place that things should be good—the best of their kind; and after that—but at a great distance—had made provision for economy. Her girls had been brought up sensibly, for the sphere in which they moved, but in a manner which by no means fitted them to endure poverty; and it was poverty—and worse than poverty, Ruin, which their father had brought upon them. Of course he had not thought such a catastrophe possible, when he had commenced his speculative career; he would not even have admitted that he was plunging into speculation; all had looked safe and smooth; nothing had seemed to be wanting but a little happy audacity to place a man of his ability and connections in the very first rank of 'business men.' He had always despised the class so termed, finding them, as he generally did, so much slower, duller, and more ignorant—except upon one or two special subjects, such as a man of quick intelligence could master in a week—than himself; and his failure would have been galling to him, had there not been a score

of other and more cogent reasons for his bitterness of spirit. As it was, the injury to his *amour propre* was not felt at all, in the agony of his deeper wounds. His pride—and John Dalton, though such 'good company,' and 'hail fellow, well met,' with all degrees of men and women, was a very proud man—was indeed humbled to the dust; but that was nothing in comparison with the humiliation he had wrought with those whom—to do him justice—he had ever loved better than himself. What would now become of his wife and children? was the question which beat importunately at the door of his brain, but which for the moment he was shutting out by reminiscences of the past, hardly less bitter. When, and how, was it, reflected he, that he had first been tempted to leave his former mode of life, and to embark upon this sea of troubles? As to who had been his tempter, he had no doubt; but where had he first encountered him? It was at a dinner to which he had been invited by a bachelor friend—a Guarlamane—at Greenwich. The company had been mostly younger than himself, as was often the case, for his wit and animal spirits recommended him to the young; and the only one present who was his senior, or rather had appeared to be so, had been Richard Holt. This man, it was evident, was not of the same class as the rest; and beyond a passing thought of what he was wanted there for, Dalton would probably not have troubled himself about him, but for a circumstance that took place after dinner. One of the guests, a young man of title, had drunk rather freely, and over an argument, in which he was clearly in the wrong, with Holt, used some contemptuous expression, reflecting upon his calling as a stock-broker.

Holt behaved very well, putting much apparent restraint upon himself, for his host's sake; and Dalton, always generous and impulsive, had taken up the cudgels for him, and silenced his assailant.

'You have made a friend of the best fellow in England to help you out of a scrape,' whispered his entertainer, when the party was breaking up; but as Dalton was not in the habit of getting into the sort of difficulties to which he knew the other alluded, he saw no reason to congratulate himself upon the alliance. However, during their drive home, on the drag, it so happened that he found himself next the stranger, and a good deal of conversation took place between them. The topic, which Dalton himself had introduced in order to put the other at his ease, was commercial affairs, with which Holt shewed himself thoroughly acquainted. He spoke of his own misfortune in having been all his life connected with them, which had produced his wealth, without the power of enjoying it in the way he desired. 'I find myself cut off from society, except that of such young gentlemen as these,' said he, 'who make use of my services without permitting me to pretend to their friendship.' He spoke with a certain mixture of pride and humility which prepossessed the other in his favour; while his references to City matters inflamed Dalton's ambition with that idea of 'growing rich beyond the dreams of avarice,' from which much better-balanced minds are not altogether free.

'With your manners and your connections, Mr Dalton, success would indeed be easy,' Holt had answered, when sounded on this point: 'such an address as yours, if you will permit me to say so'

(a favourite expression of his new friend's), 'would fetch a very high price east of Temple Bar; we are cunning enough, but without the tact that at once persuades and conquers.' The flattery was coarse, but, administered after a Greenwich dinner, on the top of a drag, it was not found fault with; their acquaintanceship thrived apace, and before they reached town, Dalton discovered—he never quite knew how—that a certain connection already existed between himself and his companion, which at once established confidential relations between them. This bond of union was that Philip Astor, Dalton's half-brother, of whom we have already spoken. That Astor was not a legitimate son of Dalton's father, was now incontestable, for it had been so settled by the law; but it was admitted even by the legitimate branch of the family that his case had been a hard one. He was by many years John Dalton's senior, and until his father's second marriage—which was in fact his first—had supposed himself to be his son and heir. Not till he was almost of age had he been made aware of his true position, and the discovery had acted fatally upon his character. He had become reckless and improvident; and though a considerable pecuniary provision had been made for him, he had squandered all his means long before his father's death, which had not taken place till John had himself arrived at man's estate. Then it was that Philip brought his lawsuit, and lost it; but so far from feeling bitter against his left-handed kinsman, John had offered to assist him from his own purse. The two brothers had met, and though the interview had been a stormy one, they had parted with less of ill-feeling than might have been expected. The one could only proffer as a gift what the other would only accept as a right; and so John's generosity came to nothing; but he had always entertained a kindly feeling for poor Philip, and had contrived, unknown to him, to procure him the means of livelihood as a merchant's clerk. This situation, however, upon discovering to whom he was indebted for it, Astor had thrown up, and down to that very night, John knew not what had become of him. To his great surprise, Holt now informed him that Philip had been employed in his office for some years.

Such had been the first introduction of the man of business to the man of fashion, and it had soon ripened into intimacy. As to Philip, he had doggedly refused, according to his present employer's account, to hold any intercourse with his half-brother; so no more was said about that matter; but Dalton and Holt did a good deal of business together, or rather in concert. Whether the latter had inoculated the former with the love of speculation, or whether he originally had it in his blood, is doubtful, though Dalton was now ready to put all the blame upon his late ally; it is more probable that Dalton was eager, and that the other did but stimulate his wishes. But they had gone into a good many 'likely things' together—doubtless by Holt's advice—and for a little time matters had gone very well with them. In return for his assistance in this way, Holt had suggested rather than stipulated that his new friend should introduce him, upon as equal terms as might be, into society; and this Dalton had done. It was no small proof of his own social influence that he had brought Mr Richard Holt into more than one

exclusive circle, and kept him there, under what were certainly disadvantageous circumstances. The Campdena, though there was nothing absolutely vulgar about them, had nothing to boast of in the way of birth or breeding, nor was their position in the county so assured that they could afford to have a man like Holt living with them almost *en famille*; he would never have found himself at Riverside but for his friend's good offices. In more than one case Dalton had had cause to lament the fate which had thus made him a sort of Siamese twin of the prosperous stock-broker; for the slights that had been inflicted upon the latter, or which he had more often brought upon himself, he had in some degree shared; but his bitterest regret was that he had permitted this man to gain a footing in his own family. The thing had been unavoidable if he was to retain his alliance, but it had been done against the grain—so grudgingly that the other had scarcely thanked him for it—and it had turned out even worse than he had anticipated. Mrs Dalton was a woman always ready to welcome her husband's friends, and make them, so far as was possible, her own; his social success owed more to her tact in this respect than perhaps he would have been ready to allow; but she could not welcome this man, who was not his friend, but only his business ally. She had disliked him before she saw him, as the person who had seduced her husband from his former pursuits—if such they could be called; had persuaded him to exchange his rôle as a charmer of society, but one who nevertheless spent much of his time at home, for, what she would have called in another, a sordid ambition. She did not want him to amass more money, and certainly not by associating with companions such as this man, whose manners and appearance were to her mind, though she did not speak her mind, by no means the worst of him. Kate did not like him, it was plain, and still less Jenny—Jenny, the invalid, who, though so fragile of frame, had so keen an eye and sharp a tongue; and yet, with all these members of his family, as it seemed to Dalton, this fellow had affected a certain intimacy.

When he had talked just now of 'those dear to him,' and had offered to be their friend, as though it were a favour on his part, he had felt inclined to knock him down. And yet, in truth, it had become necessary that somebody should befriend them. He himself was a hopelessly ruined man, while Holt was, by his own confession, rich. He could not say that he had become so at his expense; nor, indeed, had his own losses, so far as he knew, been of the least advantage to the other; but, somehow, he felt as though he had been the man's cat's-paw. As to the *Lara*, the speculation had been brought under his notice—like all the rest—by Holt, but in a more private sort of way; it was a pet investment of Holt's own, and at one time they had possessed nearly the whole mine between them. Then, as the shares rose, Holt had, it seemed, sold out—as, indeed, he had advised Dalton to do—while he had held on; and the end was that the one had come out of it all safe, and with a large sum in pocket, while the other had lost his all, and more than his all; for Dalton had not only lost his own money, but that of his wife, which, by her own wish, and from her unbounded confidence in him, had not been settled upon her at their marriage. His shame and horror were

so great, that for the moment he had not dared to look that part of the matter in the face, but had forced his thoughts, as we have said, to travel back over that fatal part of his life's journey on which Richard Holt had just become his companion. He had felt of late months that companionship growing more and more distasteful to him, but at the same time more indispensable; he distrusted him in his heart, though, as reason told him, without any justification for such a feeling: he had begun to hate the man because he thought he saw he had had the audacity to look even beyond his friendship; and though up to that night he had been able to regard his pretensions with grim contempt, he could not do so now. It was that reflection which had, in fact, made him so rude to Holt at parting an hour or so ago—for so long had he been chewing the bitter cud of memory—and which now made the man so loathsome to him. And yet his mind preferred to dwell upon him, and his relations with himself, rather than upon his own ruin, and the effects that must necessarily result from it. For what was underlying all his thoughts, and tincturing their sadness with a bitterness far beyond that of the waters of death, was the consciousness that when he left that room it must needs be to seek the presence of his wife, to tell that dear one of the blow which had hurled her and hers from wealth to poverty, and that it was his own hand that had inflicted it.

How cold and cruel, in her stately beauty, Nature looked that night; how unmoved by the agony of his soul. How peacefully slept the moonbeams on the crags, as though to the lullaby of the river's song! If he made away with himself, she would still smile on. If he shot himself! The thought recurred to him with a terrible impetuosity, before which all mere sentimental reflections vanished. Would it not be better to have done with life, the sweets of which had been squeezed out, and nothing left but the bitter rind? He could do no good to his wife and children by living on, for he could never be their bread-winner. How could he—he, who had done nothing from his youth up but fare of the best without toil of brain or muscle—he who had paid nothing but a light jest or two for his place in the world, hope to support these helpless ones, being himself so helpless! Nay, he would be a burden on them, rather, for a woman and children might find shelter which could not for very shame be accepted by a man like him. In all respects it would be better for them that he should die. As for the sin of it, and his own punishment hereafter, it did not at that moment enter into his calculations; if he thought of himself at all, it was to reflect that if he killed himself then and there, he should be spared the interview which was awaiting him below-stairs. He threw a glance round the room just as Holt had done upon leaving it, but it fell upon nothing in the way of weapon, unless a gilt paper-knife, with a tiger's tooth for handle, could be called so, with which he remembered, with strange distinctness, cutting *Blackwood* the last time he had visited Riverside in the spring. The magazine had contained some forecast of the coming general election, and amongst other places had mentioned Bampton as wavering in its allegiance, and likely, though

after many years of fidelity, to return a Liberal candidate. The vacancy in the borough had taken place through the death of its representative—the constituencies in general not having as yet been appealed to—but the apprehension expressed by the reviewer had proved groundless, to his cost. How Campden and himself had smiled over it at the time, and how confident he had been of the contrary issue—for Bampton had even then been in his eye, although vaguely—and how valueless and utterly uninteresting the whole subject had now become! If he had been a member of parliament even, instead of a rejected candidate, it would have availed him nothing, but only have made his fall the greater. It was not probable, thought he grimly, that any difference would be made in the manner of his reception in the next world, from his having been chosen by the electors of Bampton, or not. A tiger's tooth! It was not by a bite, as he had read, that the tiger killed his man, but by one blow of his mighty paw. That must be an easy death to die; but the method was exceptional, and not within his reach. He took from his pocket a little penknife; its handle was of tortoise-shell, inlaid with silver, and upon it was a date engraved. Jenny had given it to him upon his birthday, years ago, when she was quite a child, ailing in health, indeed, but before her disease had declared itself. 'It will not cut our love, dear papa,' she had said, alluding to the proverb, and her present. His hand trembled for a moment, and he felt that sting in his eyelids which is the precursor of the bitterest tears; but no tears fell. Since he loved her so much, it was the more necessary that he should do the best he could to smooth her life-path, and the best he could do was to die. That he honestly believed, for he was probably unaware how forcibly his own personal misery was impelling him to such a course. The blade was as keen as a razor, and had a sharp point. If he had been a doctor, or had had any scientific knowledge—whereas, thought he bitterly, 'I know nothing'—he would have known exactly where to strike, and all would have been over in a moment. He had read about 'the jugular vein;' but he could not work up his mind to cut his throat; he was not afraid to do so, but the idea shocked his fastidiousness. 'What a fuss that woman would make about her carpet!' was a reflection too that characteristically crossed his mind. He remembered to have seen a surgeon of his acquaintance indicate the exact spot in the left side where even the thrust of a needle would cause instant death; if that was the case, surely a knife like this—Here a circumstance occurred which disturbed him beyond measure. He heard the door behind him open and shut, and felt that he was not alone. Was it possible that his wife, alarmed by his prolonged absence, and knowing that the others had long since retired, had come up to look after him. His face grew damp, and the night-air blowing cold upon it, he began to shiver; his hand became so unsteady that he could scarcely hold the knife, with which he now pretended to be paring his nails.

'I hope I have not disturbed you, Mr Dalton?' said a cheerful voice.

'Thank Heaven! it is only Derwent,' muttered the wretched man.

'I came up for a book that I had forgotten,' continued the young fellow, 'and had no idea that

you were still here. Your cigar is out; shall I give you a light?

'No, Jeff; thank you.'

There was something of sadness in the tone, that struck the lad's keen ear.

'Can I do nothing for you? You are not ill, I hope?'

'Not I, my boy; only a little down in the mouth, from being the rejected of Bampton. If you had had a vote, you would have plumped for me, would you not?'

'Indeed, Mr Dalton, I would plump for you for everything.'

The genuineness of the young fellow's speech, and its simplicity, were such as a man like Dalton could not fail to feel, even in his present condition.

'I have no doubt of that, Jeff,' he replied kindly. 'You and I have always been good friends.'

'But the goodness was on your side,' answered the boy. 'It is to no one's advantage in this house to be a friend of mine. It is everybody's advantage to be a friend of yours.'

Dalton laughed so mockingly, that the other paused in wonder, and when he continued, his voice had a still more earnest gravity. It was evident that he saw something was very wrong.

'I am so powerless, Mr Dalton; but if the most I can do can be of the least service to you or yours, you will not forget to make use of me. I have thaws and sinews—but that is all, I am afraid.'

'And wind, Jeff—excellent wind, if what Tony was telling me to-night was true. You got into trouble about it, I hear, but you won the Guide Race.'

'Yes; I came in first, though it was almost by a fluke. If I had not gone at the brook, I should have been beaten. Here is the belt;' and the lad exhibited that token of his prowess—which vanity had caused him to buckle round his waist, a broad leathern strap with a silver clasp—with conscious pride.

'And did you get a prize in the wrestling ring also? Were you Hercules as well as Hippomenes?'

'No; Mr Holt said he thought that it would be considered "unseemly"—he meant, I suppose, caddish—and yet I almost thought that Tony would have persuaded him to try a fall himself. He will do anything for Tony, or for the girls, or for Mrs Dalton—that I will say for him.'

'What a pity he did not wrestle,' observed Dalton grimly. 'They might have given him a cropper, some of them, big as he is.'

'Yes, indeed; but he laughed it off by telling Tony that he couldn't do it because his life was not insured; though of course he never meant to. I suppose I must thank him for sticking up for me to-night, and saying that it was by his advice I entered for the Guide Race; though it was not true; and he only said it to please Kitty.'

At any other time that suggestion would have excited Dalton's wrath; but he had not heard the boy's last words. A sentence that had just before dropped from his lips quite accidentally was ringing in his ears, and made him unconscious of the rest.

'Well, well, Jeff, we must not talk any more to-night, or Mrs Campden will be accusing me of teaching you more bad habits—sitting up till the small-hours, for one thing. Good-night, my lad.'

'Good-night, Mr Dalton.' As the boy withdrew, he noticed how his companion's face fell forward on his hands, and felt that he was in sore trouble. It was so strange to see the man whom he had always known so light and gay, in this sad case, that he was loath to leave him, even at his own request. Yet he felt he had no choice. He could not cure his grief, whatever it might be, or even soothe it, being, as he had said, so powerless. He never knew that—powerless though he was—his entrance into that room had perhaps saved a fellow-creature from self-destruction. The words he had quoted from Holt's mouth, 'Because my life is not insured,' had reminded Dalton, who, in his agony of regret and shame, had clean forgotten the fact, that his own life was insured, and that the policy would be made void by his suicide.

There was no escape left for him in his wretchedness, even in death itself.

A U T O M A T A .

PASSING over many notices of exceedingly curious but questionably authentic automata (machines acting by means of concealed machinery), from an early time, we come to the devices of Vaucanson, an ingenious Frenchman who lived at the beginning of the eighteenth century. In 1730, the statue of the flute-player at the Tuileries suggested to him the idea of constructing an automaton which should actually play the flute. He accordingly set to work, and after some years produced the celebrated automaton flute-player, which was exhibited in Paris in 1738, said to be the most perfect android ever constructed. It performed many pieces on the German flute; a very remarkable fact, when we consider the complicated movements of the lips and fingers which are necessary to blow the instrument naturally.

Vaucanson also executed another celebrated android, or automaton in human form, about 1741, which played the Provençal shepherd's pipe, and beat a *tambour de busque*. One hand contained the flageolet, the other the stick for beating the tambourine. The automaton could play about twenty different airs. He also constructed an automaton duck, which closely resembled a living one. It ate with avidity and with quick motions of the throat, drank and muddled the water with its bill, quacked, and was supposed at the time to imitate by chemical means the process of digestion. Houdin, the noted conjurer, who repaired one of the wings, examined the figure, and discovered that each process was due to clever mechanism. Vaucanson is reported to have made several other automata of less note. One was a loom in which a donkey worked cloth, constructed to spite the silk-weavers of Lyon, who stoned Vaucanson because he attempted to simplify the old-fashioned loom. He also invented an endless chain, which still bears his name, and a machine to make meshes of equal size. In short, he was a most extraordinary genius, whose mechanical devices were vastly amusing.

About the middle of the eighteenth century, a father and son, named Le Droz, of La Chaux de Fonds, Neuchâtel, produced some clever automata. Le Droz the elder's principal one was a figure of a child which wrote anything dictated to it. Le Droz the younger, who was born in 1752, is best known as the inventor of musical snuff-boxes. He

went to Paris at the age of twenty-two, taking with him, it is said, a female figure which played on the harpsichord. His most celebrated automaton was the piping bull-finch, contained in a gold snuff-box, four and a half inches long, and three inches broad. The box had a partition within, the upper portion containing the bird, the lower, snuff. The lid of the box flew up with a spring, when a bird, about three-quarters of an inch long, of lovely plumage, made in enamelled gold, started up, wagged its tail, spread its wings, opened its bill, and began to pour forth a melodious song. When it ceased, it seemed to dart down into the box, the lid of which closed upon it. A similar automaton is attributed by some to Maillardet, and another was exhibited some years since in London. Le Droz the younger also constructed a drawing automaton. It had in one hand a metal style, under which a card of Dutch vellum was laid. On touching a spring, the figure began to draw, lifting the pencil at the necessary points, so as to avoid a slur, as in passing from a forehead to an eye. Having finished one drawing, the figure rested while another card was laid. It could fill five or six separate cards without being rewound. Le Droz is also stated to have produced an automaton peacock.

The celebrated Automaton Chess-player was invented by Baron Wolfgang de Kempelen, of Presburg, Hungary, Aulic Counsellor of the Royal Chamber of the domains of the Emperor in Germany. The history of the machine has often been incorrectly told. The following is, we believe, the true account of it:

In 1769, a revolt broke out in a Russo-Polish regiment at Riga, headed by a Pole named Woronski. The Poles were eventually defeated in a pitched battle, and in the rout Woronski had both his legs shattered by a cannon-ball. He contrived to throw himself into a ditch, and at night dragged himself to the neighbouring house of a surgeon named Osloff. The surgeon, moved by his sufferings, attended him and concealed him in his house. Both legs were amputated, and Woronski recovered, contrary to expectation. De Kempelen came about this time on a visit to Osloff, and to him was confided the secret, and his assistance begged to get Woronski out of the country; for had he been found in the house, the consequences would have been serious. It happened that Woronski was a fine chess-player, and the idea occurred to De Kempelen of concealing the mutilated man in a box, so that the contrivance could be passed off as a chess-playing automaton. In three months the automaton was finished. It has been so often described, that it will be sufficient to mention here that it was a life-size figure of a Turk seated at a chess-board. The machinery of the interior was attached to langing frames, which could be pushed back, so that Woronski could conceal himself in the body, notwithstanding that it appeared to be filled with wheels, cranks, pulleys, &c. While the lower cupboard was being examined, Woronski crept into the body, and passed his arms and hands into those of the figure, and his head into the mask, whence he could see the chess-board. In order to give room for the passage of his head, the neck was surrounded with a large collar, so contrived as to conceal the hollow space necessary there. The spectators having, as it appeared, thoroughly examined the

inside, the doors were closed, and the whole machine having been wheeled about the room, to shew that there was no connection from beneath, a small door in the thigh was opened, and the automaton wound up. This winding up was a mere blind; at each move, the noise of machinery in motion was heard; this noise was purposely introduced to drown the sound of the movements of the performer. On October 10, 1769, the first rehearsal was held, the figure playing a game with Osloff. A month later, Woronski was sufficiently perfect in his part. He was hid in a large box, which had to be moved very slowly, on pretence of fear of breaking the machinery, but in reality to protect the inmate. In order to avert suspicion, it was agreed to give performances on the road at all the towns passed through. The travellers got as far as Vitebsk, on the road to the Prussian frontier, without interruption, when the Empress Catharine, having heard of the singular powers of the chess-player, commanded its presence at the imperial palace, where the proscribed rebel actually played with the empress. It is said that she attempted to cheat by making a false move, when Woronski's temper getting the better of him, nearly caused the whole conspiracy to collapse. The automaton upset the pieces with a blow of his hand, and the clock-work stopped as though injured. The empress took it very good-humouredly, possibly because she was not sorry thus to save a lost game. She at once offered to purchase the automaton, and insisted on its being left in the palace library all night. Fortunately, De Kempelen managed to smuggle off Woronski in the big chest; and next day he told the empress that the figure could not perform without him, and therefore that it was no use his selling it.

Three months afterwards, the automaton was safe in England, under the management of Mr Anthon, to whom De Kempelen is stated to have sold it; but, according to some accounts, it was not sold until after De Kempelen's death in 1803. Anthon visited the whole of Europe, and made large sums by the exhibition. At his death it was bought by M. Mielzel, who took it to America. Mielzel died on his return passage; and his heirs sold the chess-player to M. Cronier of Belleville, at whose house M. Houdin saw it in 1844. Houdin was the first to give the true story of this remarkable figure, on the authority of M. Hessler, a nephew of Dr Osloff's.

De Kempelen also invented an articulating machine which pronounced words with a French accent. In most speaking-machines, the effect is produced by an assistant placed out of view, who hears and replies by means of a concealed acoustic tube; as in the case of the invisible girl of M. Charles, which heard and answered questions through trumpets, apparently suspended out of communication with any living person; or by placing the figure and the head of the assistant in the foci of two concave mirrors which are opposite to each other, a hole being made in the partition of the room, which is concealed by a thin cloth. De Kempelen's machine seems to have really articulated by means of reed pipes and bellows. The construction of it employed the inventor in 1783, and for some years after. After many investigations, he discovered that the reed of the Highland bagpipe emits sounds most nearly resembling those produced by

man, and he succeeded in obtaining the vowel-sound *a* from a reed connected with a tube. By the invention of numerous contrivances of too elaborate a character to be described here, De Kempelen finally overcame all obstacles. He obtained the sounds of nearly all the consonants, and managed to combine them so as to form words. It was the intention of De Kempelen to make the machine to resemble a child; but it is uncertain whether it was ever so completed.

M. Maillardet, a celebrated Swiss mechanic in the beginning of this century, produced a number of automata, of which the most remarkable was a lady who executed eighteen airs on the pianoforte, and actually pressed the fingers on the keys, the flats and sharps being played by means of pedals, as in an organ. In fact, the instrument, though called a pianoforte, was a kind of organ blown with bellows. The figure is said to have played in a manner so similar to a living performer, that at a distance the difference could scarcely be perceived. Maillardet also invented a drawing and writing boy. Most writing and drawing androids are worked by machinery which passes through the floor to an adjoining room, where an assistant directs the figure by means of a pantograph, a scientific instrument, one arm of which being moved, causes the other arm to trace the movement in fac-simile. The cleverest of these was a writing-hand, exhibited in London, which was apparently isolated on a plate of glass, and consequently it appeared impossible for the movements to be obtained in the manner just described. There was in reality a double sheet of glass, the lower one, through which the motion was communicated, being movable; but both sheets of glass being transparent, the motion of the lower plate was not perceptible. Maillardet's writing-boy was not dependent on such assistance, but really moved by the action of springs working on combinations of various levers, which traversed the circumference of metal plates, the edges of which were cut into different shapes, so as to produce a corresponding outline; and to make the up-and-down strokes thinner or thicker as required, in imitation of actual writing and drawing.

The same artist also invented a magician that answered questions. The figure was seated, and held a wand in one hand, a book in the other. Twenty oval brass medallions on which questions were inscribed were handed to the audience, who chose one at random. The chosen medallion was put into a drawer which shut with a spring. The figure then, after spending some time in apparent study, rose, waved the wand, and struck the wall above its head, when two folding-doors flew open, and displayed the answer. The doors then shut, and the figure re-seated itself. The *modus operandi* was simple. The medallions had holes, which did not precisely correspond, and these were brought into contact with needles, so as to produce a different result with each medallion.

Maillardet also constructed an automaton tumbler, only a few inches high, and inclosed in a glass case. When at rest, the tumbler sat on a slender steel rod, which it grasped with both hands. When in action, it descended and hung by its hands, then tumbled and adopted a variety of attitudes, and finally seated itself again on the rod, and bowed to the audience.

The principle on which figures of rope-dancers

and tumblers are made to imitate human action is, that the rod they grasp is a tube, through which levers are brought to bear on the figures. Though simple enough in the statement, their construction is very complicated, numerous small details which require great artistic skill having to be perfected.

In addition to the above, Maillardet made a humming-bird, a steel spider that ran for three minutes, a caterpillar, a lizard, a mouse, and a serpent which crawled about in every direction, opened its mouth, hissed, and darted out its tongue, remaining in action for seven minutes.

Robert Houdin, the most celebrated conjurer of his day, was a clever constructor of automata. The taste was first developed in him in consequence of his purchase from a Dutch mechanic, named Opre, of a small harlequin, which leaped out of a box, performed some evolutions, and returned to the box at the word of command. This automaton had to be repaired by Houdin, who afterwards repaired other automata—namely, Vancanson's duck, already noticed, and the Componium, a mechanical orchestra, which could play operatic overtures with precision and effect, and could improvise variations without repeating itself. It was exhibited by a Prussian, named Koppen, in Paris, about 1820, and brought him in a considerable sum, after which he sold it.

The automata made and exhibited by Houdin were four in number. One was a pastry-cook that issued from a door at the word of command, bringing various refreshments, according to the request of the spectators. At the side of the shop, assistant pastry-cooks were seen rolling paste and putting it in the oven.

Another of Houdin's automata was an imitation of the two clowns Auriol and De Bureau. The latter held out a chair at arm's length, on which his comrade performed acrobatic tricks like his namesake in the circus at the Champs-Élysées. Afterwards Auriol smoked a pipe, and accompanied with the flageolet an air played by the orchestra. Since Houdin's time, other tumbling figures have been exhibited. The earlier of these, called the Automaton Icotard, was constructed by Professor Pepper. It tumbled and postured on a swinging trapeze. It was patented, and the mechanism is fully described in the specification. A conjurer named Beaumont improved upon this by making a large doll vault upon a swinging rope, and, after holding by its hands, disengage them from the rope without assistance, and then hang by its feet.

A third mechanical contrivance of Houdin's was the mysterious orange-tree, on which flowers and fruit seemed to grow at the request of the ladies. This was also used as part of a conjuring trick, a borrowed handkerchief being discovered in one of the oranges, which opened, when two butterflies took it by the corners and unfolded it.

The electrical dial trick of Houdin's may also be classed as automatic, it being intended that the spectators should believe it to be isolated. A dial of transparent glass was hung up in the theatre, and while suspended, it would mark any hour desired by the audience, and would strike the time on a crystal bell suspended with the dial.

Sir Charles Wheatstone, the inventor of the stereoscope, devoted a great part of his life to studying the nature and laws of sound. He made a mechanical violin, which was both played and fingered by machinery. In 1835 he communicated

a paper to the British Association on the various attempts which have been made to imitate human speech by mechanical means. This paper led to the construction of his speaking machine, which imitated simple articulate sounds with considerable exactness.

In 1875, the latest wonder in the way of automata, the joint invention of Mr John Nevil Maskelyne and of Mr John Algernon Clarke, was brought out at the Egyptian Hall, London. The figure, which has received the name of Psycho, represents a man in oriental costume, twenty-two inches high, seated cross-legged on a box, and, to all appearance, perfectly isolated, on a hollow cylinder of transparent glass, without any connection with an operator at a distance. It may be freely examined by the audience, who are allowed to look and feel within the body and pedestal, to ascertain that there is no Woronski concealed there. Psycho plays at whist with persons who volunteer from the audience, itself choosing and taking up with its finger and thumb the proper card, without any one calling out the cards played by the other players. It also performs several conjuring tricks; replies to questions by striking a bell; moves fast, or slowly, or stops, at the direction of any one of the audience; works sums in arithmetic; and executes a variety of feats which demand intelligence, as well as complicated and ingenious mechanism. As yet, no positive explanation of Psycho's movements has been brought forward, though many ingenious guesses, such as that in *Macmillan's Magazine* for January 1876, have been hazarded.

WESTCHESTER TOWER.

SOME years ago, I had occasion to make a short trip from London, to visit my old college friend, Maitland, who had settled down as a clergyman in connection with the cathedral of Westchester. It was a pleasant excursion, chiefly by railway, and I was hospitably entertained. After dinner, my friend and I walked out in the dusk of the evening, to look at the antiquities of the place. In the course of our ramble, the moon rose, and threw a charm over the scene. With the moonlight streaming through the coloured windows, we sauntered through the ancient cathedral, enjoying the solemnity of the edifice.

As we approached the gates of the choir, Maitland, though accustomed to the place, became singularly silent. All at once, he called on me to notice that we were standing under the main central tower, and that in the vaulted dome overhead was a round black spot. 'You see that dark spot,' said he: 'it is a covered hole opening up into the tower. It is sometimes used for the hauling up of lead and timber for repairs on the roof. I call your attention to it now, because I am going to tell you something about it by-and-by.'

Seated once more at the fireside of my bachelor friend, I listened to what he had to say about the hole in the tower. I will try to repeat his story as he told it to me.

'I suppose it must be about five years ago, soon after I came to the cathedral, that I was engaged

one evening in this room, writing, when I had occasion to refer to a book not in my possession, but which I knew to be accessible to me in the cathedral library. To procure the work, I sallied out with a lantern; and I had not gone very far when I was assailed by a cheery shout from Symes—Geoffrey Symes—an Oxford man, who had been my junior at Oriel. Symes was a little eccentric. He had taken a fairish degree, and might have done well, but, being passionately fond of music, he took to studying the organ; and this had brought him to Westchester, as a professed pupil of the organist. As such, he was allowed to have constant access to the instrument—one of wonderful compass—in the cathedral.

'Symes would not, perhaps, have been called a scientific musician; but he had a wonderful gift of expressing thought and feeling on the organ, which he almost made to speak, so extraordinary was his power in bringing out effects. When engaged in this way, he seemed to be lost in an enthusiastic ardour. He wildly revelled in musical sounds. On this occasion, he seemed to resolve on a display of his powers. Rushing away for a few minutes, he brought little Jim Oxley, son of the verger, to blow the bellows; and, with this necessary aid, he set to work, and produced a voluntary that was altogether marvellous, and the effect of which was enhanced by the darkness. Well-known passages from great masters were skilfully welded with harmonious links into one another. One, however, a favourite of his as I knew, was complete, and alone—the "Quando Corpus," from Rossini's *Stabat Mater*. I could compare it to nothing but the strenuous forging together of solid bars of melody, so severe, so nervous, so weighty, was the working out of the theme. And last of all, with most ravishing sweetness, came the exquisite Duet and Chorus from Mendelssohn's *Lobgesang*, "I waited for the Lord," and as those delicate silvery strains of patience and thankfulness streamed into one another, and melted at last with the chorus into the great tide of praise, I was unconscious of anything but the music, and could have stayed there without further thought till the morning.

'I was aroused from my ecstasy by little Jim, who had been blowing the bellows all this time, asking me if he might go home, as his father did not know where he was. I let him out; and as the door fell behind him, I heard the low, dying wail of the organ, as Symes struck one or two ineffectual notes, and exhausted its last breath. He came down and joined me; and as I was taking up my book and lantern, previous to our departure, he suddenly cried: "Hollo! that tower-hole is open. Just fancy looking down through there into the nave."

"Yes," said I; "I daresay it would be very pretty; in the meanwhile, I am going home, however."

"All right," said Symes. "Lend me your lantern, and I'll bid you good-night."

"Why, what are you going to do?" I said.

"Going up into the tower," he replied.

'In vain I tried to dissuade him, using every argument to represent to him the folly, the uselessness, the danger of such a proceeding. Good-humouredly but obstinately, he threw aside my remonstrances; and when at last I found him resolved, I made up my mind reluctantly, and not in the best of humours, to accompany him on his fool's errand. Thank God that I didn't leave him alone, as I had intended!

'I was little disposed, however, to respond to his lively sallies, as I followed him into the staircase which led to the tower. The lantern was of little use to us as we climbed the worn steps. A cold strip of moonlight came through an open slit in the wall now and then, but otherwise we were in the dark. After some few minutes' ascent, we came to a doorway that led over the top of the transept arch under the leads of the roof. Begging Symes to look about him and to tread carefully, I passed after him through the darkness into the main tower. From where we stood, the upper side of the dome-like ceiling of the centre of the nave, between the two transepts, rose like an inverted cup before us; and at the apex of the dome, through the opening which had suggested this wayward undertaking, the moonlight streamed dimly up into the darkness of the tower. To carry out his purpose, Symes now proceeded to crawl up the dome, in order to look down through the orifice. I knew it was of no avail to say anything, so I stood and watched him with anxiety, as he leaned over the verge of the chasm.

'As I gazed, I became aware that immediately above the opening a stout rope was swinging, to which was attached a large hook. I remembered that some repairs had been going on for a few days on the roof of the cathedral, and that I had seen one or two rolls of lead wound up through the hole on the previous day. These thoughts were passing through my mind, when Symes, catching hold of the rope, jerked it, to ascertain that it was fastened above, and leaned forward with his weight upon it, as he looked downwards with exclamations of delight. "Come up, sir, and see; do!" he cried. "It's worth all the trouble of a climb."

'I was just about to creep up, that I might share his gratification, when a sudden whirring, grating sound of wheels above—a gasping exclamation—a scuffling snatch with his feet, at the edge of the hole, and before I could move, I saw the poor fellow disappear rapidly through the opening, as the rope uncoiled itself with increasing velocity from the winch overhead. It flashed across me in a moment. The handle of the winch had been imperfectly secured; the jerk and the subsequent weight had overcome the resistance, and trusting wholly to the rope, he had slipped from his footing. The hope occurred to me, that the evident resistance which still restrained the free revolutions of the winch might prevent the descent being so rapid as to endanger life or limb; so that he would possibly land in safety with only a severe fright and shaking. These thoughts crowded pell-mell upon my mind, at the first shock of surprise. But, conceive my horror, when, with a loud jar, the noise of the wheels ceased, and the rope no longer descended.

'How I started! He has let go, thought I, and listened breathlessly, in sickening expectation of the crash which I conceived must follow. But all was still; and mechanically I crawled up to

the edge of the hole and leaned over, thinking to see his crushed body in a ghastly heap below me.

'No! About five-and-twenty feet down, vibrating in sheer space, was suspended my poor friend, at a height of at least fifty feet above the stone flooring of the nave. He was in the very midst of the stream of light that poured through the clerestory windows. In some way or another, he had relieved the strain upon his hands, by getting his leg over the hook at the end of the rope. I called to him to hold fast for a while, and to keep up his courage; but I never shall forget his despairing eyes, nor the hoarse agonising whisper that replied: "I can't hold on! I'm numbed. Loose the winch! Be quick, for God's sake!"

'Waiting for no further suggestion, I rushed back again to the staircase, and found in the darkness, almost by intuition, the steps which led still upwards, and hastened to mount them. Once or twice, as I panted in the ascent, I remember that I came to the edge of a sheer depth, and drew back, scarcely conscious of the danger. I listened intently for any sound from below, but heard nothing; and at length, in what must have been an incredibly short space of time, breathless and gasping, I emerged on the rough uneven flooring of the higher story of the tower. Trembling, I crept carefully forward to the centre of the space, and found the winch standing over an opening corresponding to the one below. I eagerly looked down, and could just see that something was still suspended in the now partially obscured light. I shouted again and again words of encouragement and hope; but there was no reply. With a sickening thrill, I set to work to examine the winch, and found, as I supposed, that the handle had been entangled in the coils of a rope, from which I had some difficulty, in the darkness, in extricating it. But once released, I allowed it to revolve slowly, until I felt that there was no further strain upon it. Scarcely, however, had the assurance of Symes's security dawned upon me as a possibility, when a deadly faintness crept over me, and I think for a minute or two I lost consciousness.

'How I succeeded in getting down without disaster through that perilous labyrinth, I can form no idea, nor have I any recollection. I remember devoutly thanking God, as I stepped out from the door of the transept on to the floor of the nave.

"Here I am, old fellow!" I cried aloud to Symes, and sprang forward into the open space.

'There was no reply. My heart beat violently! Could he have gone home, and left me there? The moonbeams had sloped farther up the building, leaving the centre aisle in deep gloom. Creeping forward in vague terror, I almost stumbled over the body of my friend, apparently lifeless, but still clinging to the rope. With trembling haste, I disentangled his limbs, and drew him on to the mat beside the verger's bench, where I left him for a moment, while I rushed to fetch assistance. But conceive again my blank despair, when I found the door, which shut with a spring, locked, and the key—I couldn't tell where! I had probably laid it down in some forgetful moment, and I was locked in, with a man dying or dead under my charge.

'I shouted; I beat; I kicked upon the door, in the vain hope of being heard by some stray passenger; but there was no house within fifty yards, and

I had heard the clock strike ten some time before. Wild with desperation, I ran back to my inanimate companion. By this time I had become so used to the obscurity as to be able to discern that while I had been away he had lifted his arm on to the bench, although there was still no further sign of consciousness. Such moments, my dear fellow, make one religious, if nothing else does. I do not know whether you have ever experienced the wave of relief that succeeds the unexpected deliverance from extreme peril; but I assure you that the conviction that poor Symes was not dead, brought me upon my knees, in thankfulness for the mercy that had protected us in such an awful crisis.

'I was overcome with weariness and weakness holding the hand of my unconscious friend, and I almost think that I was dozing, when I heard the sound of an opening door and friendly voices. I cried aloud, and we were at once surrounded with lights, and eager, frightened, inquiring faces, besieging me with questions, which for the time I was altogether unable to answer. Symes, still insensible, was carried to his lodgings on the other side of the green, whither I followed him, and waited for more than half-an-hour, until the doctor came and told me that he was partly conscious, but must not on any account be disturbed or excited by seeing anybody. He said he would remain with him through the night; and I returned with anxious thoughts and an exhausted frame, but with a grateful heart, to my own home.

'It turned out that little Jemmy Oxley had been the means of bringing us the help that we had despaired of. My old housekeeper had come into my room here two or three times during my absence, and could not understand my leaving the light burning, if I had intended to be away so long. She went over to Oxley's, and mentioned the circumstance, on which the verger said: "Why, my boy left them in the cathedral an hour ago. And you may depend upon it," added he, "that they've agone and locked themselves in, and that 'ere young fellow has been and lost the key, and they can't get out!" Which turned out to be pretty nearly the truth.—And now, let us have some tea.'

'Well,' said I, 'that's an adventure, certainly, and not badly told either. It made me feel very shaky about the knees, when that poor fellow went down the hole. I suppose he got all right again?'

'No; poor man,' said Maitland, with a sigh; 'that is the saddest part of the history. He was dreadfully knocked down for some days, and then apparently recovered his general health, except that he had lost all his buoyant spirits, looked like an old man, and always seemed to avoid me. He has since gradually sunk into a state little better than idiocy, which the doctors attribute to the shock to a highly excitable brain, and declare to be quite hopeless.'

'Poor young fellow,' said I. 'I wonder how far he remembers the circumstances of that night.'

'Very little, you may be sure,' said Maitland.

And so we gradually floated away into the stream of friendly talk upon general subjects, until at a late hour we parted for the night.

I awoke in the morning from an eerie and weary sleep-journey, and soon gathered what had been the mischievous spirit presiding at my dreams! A bath set me to rights. And after breakfast, Maitland drove me briskly out of the

old city through the frosty morning air, to the station.

'May I make use of your story?' said I to him, as we parted.

'With all my heart,' he replied. 'And if you like, I'll send you up my memoranda. Good-bye.' And this is the use I have made of it.

JACK TAR.

THERE is no character who has kept his place so long in the heart of the British public as Jack Tar. When he was pressed on board tenders, and served in three-deckers contrary to his will, the country loved him still, if the feeling was not always reciprocal; when he wore a pigtail, and called every landsman a 'swab' or a lubber, we still felt him to be a part of ourselves; and now, when he lives in a turret-ship as much under water as above it, is more stoker than sailor, and swings no longer upon the giddy mast, he is as dear to us as ever. The whole nation rises in its wrath when it hears that his life is traded upon by heartless shipowners, and shakes the strongest ministry that is supposed to permit such things, to its basis. When the author of the *Episodes of an Obscure Life*—the man that drew the water-cress girl, and touched all hearts by his description of the London poor—undertakes to tell us of Jack and his doings, one expects to be a good deal interested; and if his performance has somewhat stopped short of expectation, we are still pleased with the photograph he has presented to us. *Jack Afloat and Ashore** is a good book, and perhaps none the worse for not quite falling in with our preconceived notions of what it should be. It has no touch of Dibdin about it, and very little of the stage-sentiment with which the subject has been so long invested. Jack is shewn to be by no means perfect; and though careless, unhappily quite as careless about the interests of other people as his own. If he is 'more sinned against than sinning,' he must be a good deal sinned against; for he is shewn to be a sad sinner. He is perhaps at his best when he is telling yarns about himself, and our author has caught his style to a nicety.

'Rees is my name, sir. I'm a Welshman, from Aberdowey, Merionethshire. I didn't go to sea till I was seventeen. I was never apprenticed. I thought a sailor's was a fine life, you see. Shouldn't, if I was a boy again, and knew what I know now. No, no. At first I sailed out of Bristol, mostly coasting-trade; carried coal and iron and grain, and such. Then I went foreign. Three times I've been wrecked. . . . Once was eight hundred miles west of Scilly, in the *Elizabeth of Exmouth*; she was a brig, timber-loaded; yes, and water-logged. Nine or ten days we were at the pumps. We got every now and then a bit of bread, or cheese, or raw ham, and the ham burnt us up with thirst. We'd to take to the maintop at

* *Jack Afloat and Ashore*. By Richard Rowe, author of *Episodes of an Obscure Life*. Smith and Elder.

last, and there we were, without eating anything. We'd got nine or ten pounds of bread up with us, but could not eat it, because we'd got no water. *Every day we sighted sails, and they saw us, but would not come nigh us. There was an American liner had to brace up her yards to run clear of us. At last a brig from Odessa to Dundee took us off.* Thus, it appears that some sailors, instead of being 'Hearts of Oak,' are 'Hearts of Stone;' and Mr Rees' account is unhappily corroborated by recent incidents. The Priest and the Levite were merciless enough to leave the wayfarer to perish on the roadside, but to refuse to hold out a hand to one's fellow-creatures drowning seems a still baser act. The captain of a vessel thus misbehaving himself may alone be answerable for the crime, but how the spectacle of it must demoralise those who obey him! Drowning, however, is not the worst of perils that beset the sailor. 'And now I can tell you something. In 1871, I was aboard a ship that was on fire all the way from India to the docks—the *Colombo*—laden with cotton, jute, and linseed. That was a fire that was caused by water: the cargo was wet. She was an iron ship, and felt so hot, we were sure something was wrong. A gale caught her, and over she went on her beam-ends. . . . Next day, when the weather had moderated, we opened the fore-hatch for ten minutes at a time, and dug into the cargo as far aft as we could. There were no flames, but the cargo was burning. We got as much out of the burning stuff as we could, and batted down to keep the air out; but when we got near Ascension, she began to cut her capers again. There was a kind of jury on her there, and the government folk clean swept her, and choked every hole, and we volunteered to take her home. But when she got into the Channel, she was at her old tricks. She was all of a smoke in the docks, and tons of her cargo were good for nothing.'

Next to having a clock-work machine in connection with dynamite on board, we can scarcely imagine a more unpleasant voyage.

Again: 'Whaling I've been, sperming and Greenland, and I've been in the slave-trade, Chinese slave-trade. Well, what are coolies but slaves? Ours mutinied twice. Put a hundred of them in irons. All died. One hundred and fifty died altogether. Got to Callao just before the bombardment. Going back, we stuck on a reef not down in the charts, near the Philippine Islands; but there were three hundred empty water-casks, well-bunged, in the hold, and they floated her.'

If these utterances, so sprightly, if not gay, and treating of such enormous disasters, remind us not a little in their spasmodic style of the personal narratives of Mr Alfred Jingle in *Pickwick*, we must remember who are the speakers. They are old 'salts,' whose acquaintance our author has made in his numerous visits to Ratcliff Highway and other marine haunts, as well as in his voyages. There is no reason to doubt that many, at least, of the adventures thus related are true enough,

and too true. Moreover, it was so contrived that one gentleman's yarn was liable to be set right—or, at all events, contradicted—on certain points. For example, a very old 'salt' will, of course, praise the ancient days.

'Where I've been, and what I've seen? Well, then, you'd better wake me early some Monday morning, and stick by me till the clock strikes twelve on Saturday night, and then, maybe, I could begin to tell you a little bit. Yes, sir, I'm a Norfolk man—Great Yarmouth. . . . I went to sea when I was about as high as the table. . . . Things were harder then. No small stores, no fire allowed; no oilskin clothes; we'd be wet for a week together. A mate's wages were two pounds fifteen shillings to three pounds a month; and now a man before the mast can get his four pounds ten shillings. But men were well made then; there were better sailors than there are now. The ships were well found; no stinting; good food, and plenty of it. You can't well have weevily biscuits in the coasting-trade, the voyages are so short. We'd corned-beef, pudding with molasses, butter, cheese, vegetables, and such-like. And no one ever laid a hand upon me, man or boy.'

Comment, by a Hy-lander—'Things were hard enough in my time. First voyage I went—it was from Liverpool—the mate chased me up the rigging, wetting me, because I was sea-sick.'

In this way, by taking many opinions, though all from the fountain-head, our author has been able to 'fry' them, as the Americans say, and to give us what is no doubt an accurate idea of a sailor's life. 'The sea,' as a profession, is not one of rose-water; but it is a great mistake to suppose that the disagreeables—and much less the dangers—are unavoidable. We are sorry to say that many of them are directly due to Jack himself. Throughout the volume it seems to be the praiseworthy endeavour of our author to hold the scales between the ship-owner and the sailor, and to apportion to each his share of blame; and in the chapter headed 'How ships are lost,' we read some sad revelations about 'Jack.' 'Many—I think I may say most of the accidents at sea,' says one who may be considered an authority in such matters, 'are due to liquor.' In this respect it seems well known that a Liverpool vessel runs more risk than one sailing from the London Docks. The crews of both have been hunted out of dens of vice, and bundled on board drunk; but the London ship gives her crew at least a chance of sleeping off their drinking, by bringing up at Gravesend; whereas, the Liverpool ship has at once to face the stormy Irish Sea, dashing in upon the dangerous Welsh coast. Here is an instance which our author quotes as 'by no means an extreme one.' A ship left Liverpool for Calcutta in tow of a tug, and in charge of lumpers. The crew were put on board as she passed the dock-gates, all more or less drunk. The master was as bad as his men, and the mate the only sober member of the ship's company. 'The lumpers

having set the sails double-reefed, cleared the deck, and made everything as snug as they could, left the ship when she had got fairly out to sea, and returned to Liverpool in the tug with the pilot. The wind veering and freshening, the mate turned all hands up to close-reef the topsails. They managed to do so; but owing to bad steering, the ship made a good deal more leeway than headway, and drifted back towards the Mersey. Alarmed by the lights he saw on shore, the mate went down into the cabin to rouse the captain. "Let me alone," was the response: "it's no use; we'll all be done for in a couple of hours." In the end, there being breakers ahead, the mate let go both anchors, and paid out both cables, and, to give the ship a chance of holding on, cut away the masts. Even then she would have probably gone to the bottom, had not a tug appeared, and towed her back to Liverpool a wreck; the useless captain 'coming on deck for the first time as she repassed the dock-gates, stern inwards.'

It is sometimes necessary to qualify the assertions of teetotalers, but one of the best friends Jack ever had, the Rev. R. Boyer of Bristol, or rather the Bristol Channel, declares that 'all the winds that blow upon the sea, and all the rotten ships that have ever floated on its waters, have not been so destructive to the seaman as his mad love for drink.' This is a painful statement; but it is even more distressing to read that 'it is a noteworthy fact that a very large proportion of ships insured for total loss are lost.' As the law of insurance stands at present, there is a temptation to the shipowner to lose his vessel out and out, because he can not only indemnify himself for its loss, but make a profit on the transaction: if owner of the cargo also, he can insure the freight and ten per cent. profit on that. Moreover, from the day his ship goes down—whatever account may be kept against him elsewhere—he has to bear no more charges. Again, a fruitful cause of accidents at sea is 'cracking on'—the crowding sail to gain an individual reputation for speed, or to please an owner by a quick passage. The fastest clipper brings the first tea to market; the 'liner' famed for short runs has her berths always full. Our author states, we know not on what authority, that if the steamers to America would allow but a day or two more for the passage, the risk from icebergs would be almost nothing. Ships' lights are often defective, whence happen many 'running-do-n' cases; and the charts that others carry are often so antiquated that they are next kin to worthless. The very novelties and improvements in ship-building, such as double-bottoms, water for ballast and sea-cocks, are sources of danger. The vessels themselves, though of course they can be of greater length when built of iron than of wood, are often built too long. 'They have to drive through the billows like a ploughshare, instead of bounding over them like a bung. They get strained, the water rushes in, and down they go like tilted teaspoons. If the *Atlantic* had been set upright on her stern, her bow would have towered fifty feet above the cross of St Paul's Cathedral.' That the powers given in 1873 to the Board of Trade, to detain and survey ships, were imperatively necessitated, is certain from the following fact. During the first nine months, out of two hundred and eighty-six thus detained, two hundred and fifty-six were found to be unsea-

worthy! Loss by fire, let us hope, can never be ascribed to owners. It is too often caused by the worst description of Jack Tar, who, breaking into the hold with naked lights, to plunder passengers' boxes, and get at the spirit-bottles, brings on the most terrific catastrophe that can happen on the ocean.

The chapter on 'Rescue' is a fine one, and treats of deeds that may be truly termed 'heroic.' The average price of a lifeboat, it may be mentioned (for the benefit of those who have large hearts and long purses), is eight hundred pounds, and the cost of its maintenance *per annum*, seventy pounds. Every time she goes out to save life, every man on board receives ten shillings by day, and twenty shillings by night; for exercise-pulls, the pay is four shillings. Twenty thousand lives have been saved by this gallant fleet. It is as well to mention that there is an institution called the Shipwrecked Fishermen and Mariners' Society, which relieves all wrecked sailors, and that the tramps who go about the country in tattered blue jackets pretending to have met with such a disaster, are impostors. The history of our Sailors' Homes, though very interesting, is too long to be here narrated; but we may say that during the forty years' existence of one of them—hard by the London Docks—it has accommodated more than a quarter of a million of boarders, of whom a third have constantly revisited it. More than two millions sterling have been deposited in its bank, and seven hundred thousand pounds been remitted by depositors to their families and friends. The Destitute Sailors' Asylum also does an immensity of good in an excellent fashion. Further east is the Strangers' Home, mostly occupied by sailors, which in addition to its other advantages, offers the most complete study for the ethnologist and the artist to be found on the earth's surface. Even when clad in European garments, 'the Aryan, Mongolian, Malay, Papuan, and Ethiopic' types are unmistakable in their aspects under that roof, which has for its appropriate motto, 'Be not forgetful to entertain strangers.'

The Seamen's Hospital at Greenwich, the Belvedere—a small but admirable institution—and the various Training-ships for boys, are all described in the present volume in interesting detail; but it is, as might be expected, in his picturesque descriptions of Jack's life at sea and on shore, at his brightest and gayest, that our author most excels. The chapters entitled 'Homeward Bound' and 'Ratcliff Highway' are well worth any reader's attention. In the former, there is an unconsciously pathetic account of a marine auction, that reminds one of the *Episodes*, and may rank on the same level with them. The boatswain has been knocked over by a block, and swept overboard by a shipped sea, so, when the calm weather comes, 'his awabbed, battered, rope-handled box and its contents are sold for the benefit of his widow. Two of the cabin passengers appoint themselves auctioneer and auctioneer's clerk, and make more indifferent jokes than good, as they puff article after article produced—things that have suffered a sea-change into nothing rich, but something occasionally very strange. There is no weeping over the jolly, plucky boatswain's effects; but in spite of the poor jokes cracked over them—a very little wit goes a long way at sea—and recognised with far richer laughter, the men respect

the memory of their dead comrade, and intermediate and chief-cabin passengers vie in running up the items to fancy prices. The battered silver whistle fetches more than a brand-new one costs on shore, and is presented, with a most high-flown address, to the grinning boatswain's mate. If sailors were as sentimental as some of those who extol them for virtues they do not possess, Jack Tar would have a hard life of it indeed. Our author presents us with no rose-coloured picture of him; but he has written a breezy book, which blows away some foolish fancies, and leaves the sober truth for our consideration.

TRUFFLE-GATHERING.

THAT curious fungus the truffle—which unlike other fungi grows under ground—has been known, and has been in demand, from early times; yet there are many points connected with its nature and development which are still wrapped in much obscurity, and are a puzzle to the botanist. Among early speculations about the truffle we find the most varied notions, some of them of a very wild nature. It is now, however, sufficiently disproved, and the true fungus character of this delicious esculent has been established.

The life process of truffles, as already hinted, has not been fully traced; but it seems likely that it contains two terms—the formation, first, of a mycelium from a spore; and then, the formation of the body of the odorous truffle from a grain produced and nourished on this mycelium. The close connection between truffles and the roots of trees, especially oaks, has long been observed; and coming to actual practice in their artificial cultivation, we find that the best way to obtain them is to sow acorns. The real originator of the practice (dating from about 1810) seems to have been a simple truffle-gatherer, Joseph Talon, in the commune of Roussillon-les-Apt, in France, who was in the habit of putting acorns in the holes from which he extracted truffles. This happy thought was 'the making of him,' as we say; and he used afterwards to shew, with evident satisfaction, the little field where his first oaks had yielded him a recompense. His direct descendants are rich through the truffle; they send, on an average, in the season, about fifteen to twenty kilogrammes every week to the market of Apt; and numerous hectares of the stony land in the neighbourhood of Cragne are employed as truffle-ground. This artificial cultivation has rapidly extended in France, and has proved an important means of utilising sterile land, where even thyme will not grow. A good crop of truffles is secured some eight or ten years after sowing the oaks, and this will increase for a considerable time, year after year, until the tree growth becomes too dense, causing insufficient aëration and too deep shade; but this can be remedied to some extent by thinning the trees; and even when the yield of truffles has declined and ceased, the district derives benefit in the form of an improved climate and a supply of wood. It appears that the production in

the French departments of the south-east, especially the valleys of the Rhone and the Var, is greatly superior to that of the western departments; in the central departments, there is but little truffle cultivation.

We have now to say a little about the gathering of truffles in France, the information being chiefly derived from a recent paper by M. Planchon. It would seem that the black truffle, or *melanospora*, with which we have chiefly to do, was almost wholly unknown to the ancients, as also the method of searching for truffles in compact ground; they were mostly contented with the *terfez*, or false truffle of Mauritania, which is easily obtained from sandy ground; or the summer truffle, which often appears on the surface. The employment of the pig in searching for truffles probably originated in Italy in the fifteenth century; and his services are now highly valued in this connection. But it is a kind of pig quite different from the obese animal which is the pride of breeders. Meagre and brisk, he trots along before his master. On reaching the place of search, he smells over the ground, and at length stops at the point where a truffle has attracted him by its aroma. A curious scene then ensues. The pig begins vigorously to dig his snout into the ground, throwing up the earth and stones, sometimes kneeling on his short fore-legs, so as to obtain a better purchase. When he has reached the truffle, however, the gatherer steps in, and with an iron prong disengages it from the soil. He generally manages to save it from the hungry jaws of his agile auxiliary; but sometimes the pig will seize it and run off, the gatherer pursuing. After much grunting and resistance, however, the animal is intimidated into giving up his prey, and the grotesque struggle ends. The gatherer is careful not to beat the pig, in case the latter might refuse his future services, or become too distrustful. The dog is also employed as an assistant in truffle-gathering, the *barboni* or barbet dogs of the Milanese and Piedmont being regarded as the best. Their use in this way also originated in Italy. At one time, in the German courts, 'truffle-hunting' with dogs was quite a fashion. But where the truffle is largely cultivated as a lucrative product, the pig is generally preferred, on various accounts. He has greater force of snout, and can dig up hard ground better, doing three-fourths of the work of excavation. The dog is sooner fatigued, is less steady at his work, and often wounds his paws in scraping out the stony or compact ground; besides, he leaves his master more to do. Still, the dog is found a valuable aid by the poachers of truffles. These men, living by fraud, and obliged to extend pretty widely the field of their operations, train the dogs just to mark with their paws the place where truffles are to be found. The men profit by the hasty index, and afterwards dig out the hidden treasures. Sometimes the *bona-fide* truffle-gatherers employ the dog along with the pig, and the process is then somewhat amusing; the pig first discovers the truffle, and does the work of digging; then, when the object is reached, the dog interposes, and carries it off in his mouth, faithfully depositing it in the hand of his master, who gives him in exchange a piece of bread.

Besides the barbets, several other races of dogs

have been trained for truffle-hunting, especially spaniels, wolf-dogs, and shepherd-dogs. The common process of training is to put a truffle in a shoe or a small box pierced with holes (the truffle being sometimes alone, sometimes a piece of lard being added), burying this arrangement in the ground, setting the dog to find it out, then giving him some dainty morsel in reward. In other cases, the dog is educated by giving him bread impregnated with oil in which a truffle has been boiled. The training forms quite a special profession. In Haute-Marne, where the search for truffles is less lucrative than in Provence, a truffle-dog will sell for a hundred francs.

Strongly impregnated by a peculiar odour, this fungus is easily detected by the olfactory powers of the dog and pig; and it is remarkable that even the sense of smell in man has sometimes served the same use. A poor weakly boy in the neighbourhood of Würzburg, it is said, was able to detect by smell, though at some distance off, the whereabouts of truffles better than trained dogs, and he came to make his living by it. The fact, however, is very exceptional. The professional truffle-gatherers sometimes smell handfuls of earth which they dig up from the truffle-ground, and are able to recognise the characteristic perfume of the fungus; but before reaching this supplementary proof, they have got to know the probable presence of truffles by exterior signs. The other means by which the presence of truffles is detected, are termed *à la marque*, *à la sonde*, and *à la mouche*. In the first, the *marque*, or slit or cleft, is a natural effect in the ground, produced by rapid growth of the truffle. The appearance is but rare, and only where the truffle is near the surface. The *sonde* is a thin probing-rod, which is thrust cautiously into the ground where a truffle may be supposed to be: the rod meets an obstacle; the man digs, and may find, perhaps a truffle, perhaps a stone. The *mouches* or flies which frequent the neighbourhood of truffles often prove a sure guide to the truffle-gatherer.

Among the features of truffle-ground is one which has been long known, but the value of which is impaired by its not being very constant. This is the yellowing, and general ill condition, or even disappearance, of herbaceous plants and small shrubs from the ground occupied by truffles. Some authors have said that the strong and peculiar odour of the truffle is the cause of this; but it is more probably due, in some measure at least, to the fact that a large proportion of nitrogen is consumed by the fungus in its rapid growth; this is at the expense of the fertility of the ground, and neighbouring plants consequently suffer injury.

REAPPEARANCE OF A FLOWER AT THE END OF TWENTY CENTURIES.

The effect of light, regarded as the revival of life in the vegetable world, has just been illustrated by the observations near Athens of Professor Henschke, under very curious circumstances. The mines at Laurium, concerning which of late years there have been such active diplomatic procedures, consist for the most part of the scorin produced by the workings of the ancient Greeks. These still contain a great deal of silver, which can be extracted by the superior appliances of modern times. Beneath these scorin have lain in a dormant state

for at least one thousand five hundred years the seeds of a kind of poppy of the genus *Glaucium*. But since the scorin have been removed to the furnaces, this plant has sprung up with its pretty yellow petals over the whole space which they covered. Unknown in modern times, it was described by Pliny and Dioscorides, and had disappeared from the face of the globe for fifteen or twenty centuries.—*Union Médicale*, July 6, 1875.

H O M E.

The following beautiful lines were written by James Montgomery, the well-known Ayrshire poet. The poet, whose smaller pieces are considered nearly equal to those of Moore, was born at Irvine, in 1771.

There is a land, of every land the pride,
Beloved by heaven o'er all the world beside;
Where brighter suns dispense serenest light,
And milder moons emparadise the night;
A land of beauty, virtue, valour, truth,
Time-tutored age, and love-exalted youth.

The wandering mariner, whose eye explores
The wealthiest isles, the most enchanting shores,
Views not a realm so bountiful and fair,
Nor breathes the spirit of a purer air;
In every clime the magnet of his soul,
Touched by remembrance, trembles to that pole;
For in this land of heaven's peculiar grace,
The heritage of nature's noblest race,
There is a spot of earth supremely blest,
A clearer, sweeter spot than all the rest,
Where man, creation's tyrant, casts aside
His sword and sceptre, pagantry and pride,
While in his softened looks benignly blend
The sire, the son, the husband, brother, friend.

Here woman reigns; the mother, daughter, wife,
Strew with fresh flowers the narrow way of life!
In the clear heaven of her delightful eye,
An angel-guard of loves and graces lie;
Around her knees domestic duties meet,
And fireside pleasures gambol at her feet.

Where shall that land, that spot of earth be found?
Art thou a man?—a patriot?—look around;
Oh, thou shalt find, how'er thy footsteps roam,
That land *thy* country, and that spot *thy* home!

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.
- 4th. MSS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

LOCHVIEW.

A TALE IN THREE PARTS.—PART I.

HAVE you ever been in debt? If you have, you will fully understand the nature of the bugbear that scared me, the wet-blanket that hung like a cloud over my early life. From my very cradle, debts and liabilities, mortgages and bewilderments, loomed round our house, and it was not very long before I began to understand what made my father so anxious at times, my mother so pensive and—if I may use the word—fretful.

And yet Lochview was as fair a place as one would wish to see. The house was large and handsome, the rooms were lofty and spacious. There were stately avenues and extensive grounds, vast stables and coach-houses; all telling that the Allens were among the great people of the county. A keen observer would no doubt soon detect how straggling the trees of the shrubberies had grown; that repairs were needed here, there, and everywhere over the place; and that a general air of dilapidation clung with lichen-like tenacity to wall, and roof, and parapet.

I have been told the cloud began to gather in my grandfather Sir Murdoc Allen's time, and he must have been a desperately wild and reckless man, for he squandered his money, cut down trees, and I believe would have sold every stick on the place, had it been in his power to do so. How he spent his income, or what sort of a life he led, is not, however, any part of my story now. The record of his deeds is well preserved through all the country-side, and not an old woman there but will shake her head with a reproachful sigh, whenever Sir Murdoc's name is mentioned. After this worthy grandfather of mine came Sir Hans Allen, his eldest son, who died unmarried, and, I fancy, must have trod rather closely in his father's steps, for the people about Lochview playfully designate him 'Mad Hans' to this day. Then came my father, the youngest of all Sir Murdoc's sons. A whole race of brothers had at one time stood between him and the title, and he had

gone into the army, to win his spurs as best he might. But after a time, these brothers, one after another, died off, and then my father was recalled to take possession of Lochview, with all its honours and—*debts*. He did not come there alone, for some years previously he had married the pretty but portionless daughter of an earl; and I, his only son, was already born when he entered into the family dignities.

My father looked upon his heritage of debt as an unavoidable mischance—it hung like an incubus on his lot; but it never seemed to strike him that an effort might be made to get rid of the crushing encumbrance. He led an easy sort of life, accepting his position as one that admitted of no remedy; keeping up our hereditary dignity by still maintaining a retinue of servants, and hunters, and hounds; and keeping up our far-famed hospitality by gathering many friends round the bountifully spread table, or at the spirited 'meet.' He was passionately fond of my mother, and would fain have sheltered her from every rough blast of adversity, and everything that could vex or annoy. The old, romantic experience of how the handsome officer won the daughter of an earl, still lived in his heart as a recollection that could never grow old or pass away.

As time rolled on, and I became fully aware of all the heavy shadows that brooded over our fair inheritance, I vexed and worried myself beyond endurance; it became the one wish of my life to pay off all the debts, clear away the mortgages, and to see our beautiful Lochview in deed and truth our own. Oh, how I longed to enjoy its loveliness without those hideous encumbrances that were ever increasing, and growing broader and deeper! I panted to go out into the world, and make a fortune, heap up money in untold quantities, and then devote it to the family good. It was clearly not to be done in the quiet shades of Lochview; there, I might conjure up wonderful schemes, and plan out deeds of untiring energy in my imagination, but it must be away in some more active sphere that my skill and talents could be

turned to account. When I dreamed of all this in the solitudes of our leafy woods, or pondered it over when stretched at full length on the sward of our park, the idea seemed feasible enough; but I was hardly prepared for the surprise and amusement my projected plans created, when I ventured to unfold them to others.

The first time I made my views on the subject known was on the day I reached my majority, and my first confidante was my cousin, Jessie Duncan. I recollect the scene well, for the event was celebrated with all the honours. Friends and neighbours for miles round were assembled at the Hall, and there were tents erected, and a feast spread for the tenantry on the lawn. What a wretched mood I was in! The very congratulations, and feasting and hilarity, seemed but a mockery—a series of mockeries, in fact—and I rushed away down a laurel walk, to crush out some of the bitterness from my heart, and smooth down some of the wrinkles from my brow. Turning sharp round a corner, with hands carelessly thrust in my pockets, and my eyes bent on the ground, I came suddenly upon Jessie, and was brought to my senses by her ringing laugh.

'Found at last! Here have I been hunting for you all over the place this last half-hour.'

'Why do you want me?' asked I, not in the least returning her merriment.

'Oh, I don't want you, in the least, Sir Knight of the rueful countenance, but it's just possible other people may. The tenants are waiting to drink your health—and here I find you, the heir, howling all by yourself in the wilderness.'

'Do be rational, Jessie, and just tell me what I'm heir to? The family debts, the family dishonour! It drives me almost wild when I think of it all.'

'Hush, hush, Alec; don't begin that theme to-day. It isn't worse for you than it has been for others; don't make yourself miserable now.'

'But it is worse for me, because I haven't the placid temperament of the "others" to whom you allude; and I've made up my mind to find a remedy. I shall go away from Lochview, and never return till I've made money enough to free the place from debt and disgrace.'

Jessie made a funny little mouth, and then tried to look very grave. She knew as well as I did the scheme my mother had planned for us both, and she knew my opinion as well as I did hers on the subject. Jessie would one day be mistress of Ormsley, the broad acres of which estate touched the very boundaries of Lochview. If we were married, the encumbrance on our estate would vanish like dew in sunshine; but I had no wish to better our fortunes by marrying a rich wife; and I am sure Jessie in her heart honoured me for my independence of spirit. Our very knowledge of this pet project of my mother's had put us on our guard, perhaps; and though we had been companions and playfellows from childhood, we were still 'only friends,' not lovers. Tease and torment each other we certainly did, but I verily believe either of us would have made any sacrifice to help or please the other. Jessie tried to look grave when she heard of my intended flight from Lochview.

'Going away, Alec! Oh, whatever shall I do? I wanted you so much to go to Crabtree on some nutting picnics this autumn; I'd quite set my

heart on it, I assure you; and I really think it's most fortunate Harry Western has promised to come and stay with us all September.'

'Is Harry Western coming here again?' asked I, somewhat stiffly.

'O yes; and I'm glad of it, for he's better at pulling down the hazel bushes than you are. He's so much taller, you know.'

'That's all you girls think about; if you can only get a man six or seven feet high to help you to pick nuts, and fetch and carry for you, you don't care for anything else. Real-life sorrows and anxieties are nothing to you.'

'Ain't they, though? That's all you know about it, Sir Knight of the doleful visage. But now come back to the lawn, or the "brave peasantry, the country's pride," will be growing impatient. And, Alec, put on a brighter look, or people will think you've seen a ghost.'

I tried to obey my blue-eyed, merry cousin; but more than once that evening I moralised on the fickleness of the world in general, and of women in particular. No sooner should I have withdrawn myself from Lochview, than Harry Western would be at hand to take my place—to ramble about with Jessie, and do her bidding. She would hardly miss me, perhaps. But is not this ever the case! Seldom after a little while are we really missed from our scene of action; some one or other is always ready to step into our shoes, to take up the reins, and to handle them, better, no doubt, than we have done! Thus I moralised.

The next day I unfolded my plans to my father. I recollect we were riding round the brow of a hill, and a turn of the road gave us a full view of Lochview Hall and the broad lands round it. My father drew up his horse and paused, looking down for a minute or so on the fair scene; then he turned away with a half-sigh, and I exclaimed: 'It's a pretty place, father; and I will never rest till every inch of it is our own—no more mortgages for me.' He looked round at me inquiringly; perhaps he thought I was going to carry out my mother's idea, and marry Jessie.

'This life of illiness doesn't suit me, father; I want to get away into some sphere of action where work and energy will win success. I want to get into some business where money can be made. Will you help me?'

'A fine enough idea in theory, Alec, but you could never carry it out. If, however, you could make all things fit in according to your views, and plan just as you propose, the achievement would indeed be a noble one.'

'But I hope to make the attempt. You would wish Lochview to be out of debt, wouldn't you, father?'

He turned round with a quick flash in his eye. 'Would a man, lost in a dark jungle, wish for the open country and the bright sunlight? Ay, my boy, next to the health and happiness of your mother and yourself, that is my dearest earthly wish,' exclaimed he eagerly.

'Then I'll do my best to rid our name of the dishonour that rests on it. You won't thwart me; will you, father?'

'No, Alec; but remember I did not bring this dishonour on our heads.'

My father spoke as if deeply pained, and I was sorry I had used the word 'dishonour,' though I did consider it dishonour of a deep tint. After

this we rode home in silence, and for some days no further word was spoken on the subject. But I knew my father had mentioned it to my mother, and that they held long consultations about it. I could see it by her wan and wearied look, by the long earnest glances she cast at me, and by the deep sigh with which she turned away when I caught her eyes.

By-and-by the mystic, noiseless whisper of rumour, that rises no one knows how, and spreads no one can tell where, had made it patent that I was going away. Everybody in the house knew it, and all sorts of reports were current. The project began to be shaped into form, and this was the guise it had taken. My father wrote to Mr Alexander Forbes, a man who had once been an agent of my uncle, Sir Hans Allen, but who was now a flourishing stock-broker in Liverpool. He had made a fine fortune there, people said; and to his teaching I was to be consigned, that I might learn the secrets of business and follow his example. I was to board in his house for the present, 'till,' as my father said, 'I had gained all the knowledge I required, or had grown tired of my whim.'

Well I remember my last dinner at Lochview. The scene flashes before me at this moment. Our dining-room was a large, lofty apartment, the walls panelled with oak, nearly black with age. Round these panelled walls were portraits of my ancestors, who seemed on this occasion to glare down at me with reproachful eyes. Our coat-of-arms figured in many a nook and corner of the place. It stared at me from the high-backed chairs, it shone out on every ornament on the table. At one end of the apartment was a large decorated window, with graceful mouldings and geometrical tracery, and from thence our family shield sparkled down at us in rich stained-glass. I recollect the sun was just setting as we lingered there, talking; and the rays slanted in through the leaves of the acacia and cyprus trees that stood outside the window, and reflected the colours of the stained-glass on the white table-cloth in flecks and flashes of light, that trembled and flickered like a broken-up rainbow. The two tall, sleek footmen arranged the viands that we had no appetite to eat, and the still sleeker butler brought in the wines that we never tasted. All the more for the servants' hall, no doubt, by-and-by. As soon as the dessert was placed on the table, and the servants were gone, my mother gave a sigh.

'I can't bear to think of your leaving home, Alec. It seems as if we were casting you adrift on the world.'

'But I'm not going adrift, mother; I hope to steer my course well, and to return home with a good cargo before long.'

'Our son means to work, Effie, to work hard, so you must not discourage him.'

'It's the "work" I complain of. I never thought to see my only son departing from his proper position, and going out to work among the common people.'

'Don't let that stand in the way, Effie. If Alec can make his fortune by honourable industry, let him do it, by all means, and build up our falling house—it sorely wants propping.'

'Not one of my family ever went into business before; none of them had to earn their money in that way.'

'I daresay not, my love. Your ancestors, as well as my own, understood the art of *spending* far better than that of *earning*. Alec may possibly become a millionaire some day; and if he does not, let us honour him for trying to help, and wish him God speed.'

My mother was silent, but she shook her head sadly. A splendid pine-apple was on the table before her: it might have tempted any one with its perfume and lusciousness; but she only turned over the dainty sections, not caring even to taste them. I think I see before me now that 'ladye of high degree' with her slight fragile figure, her aristocratic features, and light-gray, well-set eyes. Sir Dugald, my father, was some years older than his wife; even now there were traces that told what a handsome man he must have been in his youth. His fine upright figure and military bearing often put me to the blush, and made me wish for those extra inches that made him tower above my head; for I was not tall like my father, nor handsome like him either. My old Scotch nurse, Janet, who had been part and parcel of our establishment ever since I was born, and was proud of our lineage, sometimes openly lamented my looks.

'Indeed, Maister Alec, you've no great cause for vanity. You've neither your mother's bonnie face nor your father's stately figure.'

'How can I help that, Janet?' I would exclaim.

'You maybe canna' help it, sir; but mind ye, them that's neither braw nor winsome should be all the prouder in mind.'

'In one way I shall never be that either, so you must just put up with me as I am, Janet.'

The old woman had a word of advice for me on this last evening, for when I had turned the clumsy footman out of my dressing-room, with a reproof for crushing up my shirts, and folding my coats into creases, she came hobbling in, and with the air of a privileged retainer, began watching me.

'These lazy fellows know naught of packing; and as for folding and cutting, I'll warrant you could do it better yourself, Maister Alec.'

'I daresay I shall, with your help, Janet.'

'Deed, I canna' do much in that way, sir, but though a silly body mysel', I can still gie ye a bit of advice.'

'Say on then,' said I, trying to shut the cover of my portmanteau.

'Sandy Forbes is a great man now, they say.'

'Indeed, nurse?'

'Ay. And I remember when he was lowly enough here, in your Uncle Hans' time. But he made money in Liverpool, and married his employer's widow.'

'Like the industrious apprentice in the story,' replied I, giving another plunge at my portmanteau.

'Not quite that—the apprentice married the daughter, but Sandy married the widow, and a rare, showy, managing woman she is. It's of her I would warn you, dear Maister Alec.'

'But what harm can she do to me?' I exclaimed, laughing.

'She has two daughters, laddie—her first husband's children—Alice and Carrie Merritt, they're called; and they tell me these young misses are very fine ladies indeed, with their silks, and feathers, and gewgaws. Beware of them.'

I laughed outright at the earnest old soul, and

said: 'You must be getting into your dotage, Janet; surely, you don't think I need a warning about fine young ladies at my age! I've attained my majority, and gone past all that!'

'Ay, don't ye be too boastful, Maister Alec. Ye know but little of the world yet, and *they* know ye'll be Sir Alexander some day; so don't be above taking the advice of an old woman like me.'

When my packing was over, I went out to my favourite retreat on the hill-side, and there, pacing to and fro among the heather, with my two dogs at my heels, I took my adieu of the place in my own dreamy way. I looked down on the clear calm waters of the loch from whence our house took its name. The tops of the opposite hills that shut in the loch almost like an inland sea, were still rose-tinted and lilac, from the last rays of sunset. Here and there were patches of mossy turf, and glimpses of shady undulations mysterious and deep. Down the sides of the hills were clusters of cottages, that nestled amidst sheltering woods. Lower down yet were bright yellow sands, on which fishermen were lounging about among their boats, and children were shouting and romping with each other. The hum of voices floated up to me mingled with the musical ripple of the waters. How calm, how beautiful it all seemed! Never had it appeared more so than now, when I was on the point of bidding it all farewell. Yet, who knows but this very calmness had been jarring on my spirit through all those by-gone years. The very repose may have been the secret talismanic influence that set all my nerves tingling and panting for a more active life. No pent-up, caged bird longed more than I did to be out abroad in the world, and to take its true place among fellow-workers. Be this as it may, I was now all eagerness to set forth on my mission, and as I looked down on the placid scenes of Lochview, a wish and prayer rose to my heart that I might be the one who should yet wrest that fair heritage from the grasp of debt and dishonour.

Ere long I found myself hurrying along as fast as express train could carry me, to that town that was to prove an El Dorado, and where all my golden dreams were to be realised. Bright visions rose in my mind as the train sped along. This money-getting theory of mine had taken such strong hold of me that I had determined to devote all my energies to working it out. Business seemed to me a noble science, and speculations were doubtless a series of triumphs. It was evening when I reached Liverpool, and as Mr—or as we more generally called him, Sandy Forbes had not come to meet me as I expected, I drove on to his house alone. When I looked out, and saw the afternoon stream of busy passers-by, and watched the stir of traffic, my spirits rose high; now, I had reached the scene of action, and brain and body were ready for the conflict. Sandy Forbes lived in an old-fashioned square, some distance from the heart of the town. When the cab stopped at the door, and I got out, I was conscious of a hope that I might escape at once to my room, to rest, and prepare myself for my coming duties on the morrow. But I soon found I had reckoned without my host, for Mr Forbes met me at the door, and after the first welcome, told me, with a bland smile, dinner was nearly ready. There was a general look of careful getting-up in Sandy's

appearance; his coat was of the glossiest black, his tie was of the most irreproachable white. I was rather provoked at having to turn out my valise and hastily dress myself for dinner, instead of being allowed to retire to my room, and enjoy my first evening in solitude. I was still more provoked when I found a whole drawing-room full of company assembled to greet me. At least the room seemed crowded at the first glance, but on a nearer inspection I found only about a dozen people were there. Mrs Forbes came forward at once with outstretched hand. I saw she was a very fine lady indeed, all glowing in satin, and lace, and gold ornaments—a much finer lady than ever my mother pretended to be, for *she* was always simply and quietly dressed, never decked out with many hues and tints, as Mrs Forbes was. Then I was introduced to the others; and ere long I found myself going down to dinner with Alice Merritt, the eldest daughter of the house, leaning on my arm. But little interest had the Forbes family to me then; I even smiled to myself as I remembered old Janet's warning about the young 'misses'; and then I took a full view of the one sitting beside me at the table. She was undoubtedly a showy girl, with plenty of colouring about her. Blue eyes, sunny hair, pink cheeks, and white teeth. And I saw her sister Carrie faintly resembled her, with a paler, washed-out kind of resemblance. Dick Merritt, the only son, was overdressed and foppish. I took a cordial dislike to him at the moment, which increased tenfold as time went on. The other people in the room were invited guests. Mr Cornish, the rich cotton broker, led Mrs Forbes down-stairs, and poor Sandy walked humbly with the broker's better-half.

I soon discovered that, as son and heir of Sir Dugald Allen, I was expected to prove a great attraction to the party—was, in fact, the chief star of the evening. What they had been saying about me, or what they looked for in me, I know not, but I could not hide from myself that I was honoured with great attention. Alice Merritt was most patronising, as girls will be to men who are four or five years their junior. She talked about Lochview as though she had been a native of the place.

'I was not aware my home was so familiar to you, Miss Merritt.'

'Oh, I don't know it personally,' she replied; 'but Papa Forbes'—and she nodded towards Sandy—'Papa Forbes spent his early youth there, and I have been asking him dozens of questions since I heard you were coming amongst us.'

'Very kind of you to take such a lively interest in me, I'm sure.'

'Lochview must be like a beautiful picture, with its hills and woods, and lights and shades. Is it not like a picture, Mr Allen?'

'Yes; and a very varying one. I wish you could have seen it as I did last evening, Miss Merritt. Then in the calm twilight it looked the very emblem of repose and calm happiness.'

'And yet you gave it up to come into this matter-of-fact, work-a-day sort of place! How I long to get away from it sometimes! A season at Lochview must be delightful, charming! Mamma always will take us to Boulogne in the season, and that is almost as crowded and over-done as Liverpool.'

'I suspect you would soon grow tired of our quiet north country. You would never see the new fashions there; we are quite half a century behind other people.'

'You like Lochview, don't you?'

'O yes; my whole life, so far, has been spent there, and there are thousands of associations that make the place very dear to me.'

Just then, I happened to look across the table, and saw a pair of deep, soft brown eyes watching me with fixed intentness; but they were averted the moment they met my gaze. A second glance shewed that the owner of these wondrous eyes was a pale girl, with a face like a sweet pathetic legend—a lily-like girl, with delicately cut features, and glossy bands of dark hair turned back in a full roll from her forehead. She wore a high black dress, unrelieved by the magic sparkle of ornaments, or by those delicate bits of colour of which girls of her age so aptly know the charm. Alice rattled away after this, but I did not give much heed to her affected liveliness; I was mainly intent on trying to meet those haunting eyes again. They attracted me with a mysterious power, they fascinated me, they tormented me marvellously; I could not account for it. It seemed like some inexplicable affinity of soul to soul. At last the ladies rose from the table; the flutter of ribbons and rustling of silks were heard as they passed out of the room and left us to our own resources. When we joined them in the drawing-room, my first thought was to get a nearer view of the little girl in black; but in vain I glanced into every corner of the room; the eyes were not there, nor the owner of them either. By-and-by, impatience got the better of me, and I began to question Alice Merritt.

'Who was that lady who sat opposite us at dinner? I don't see her here now.'

'Oh, you mean Mrs Wilkins! She is the wife of an awfully rich old ship-owner.'

'Indeed! A very young wife, I should think.'

'Not so very young either, but very well preserved. See; that is her husband talking with Papa Forbes—we always call him "Papa Forbes,"' added she, laughing.

I looked over, and saw a very stout old gentleman, with a bald shining head and short-cropped white beard. He held 'Papa Forbes' by the button-hole, while he propounded in his ears some intensely interesting subject, no doubt.

'Is that Mrs Wilkins' husband? Where is she now?'

'The carriage came for her just after dinner. Her married daughter gives a children's party to-night, and she is gone to help to entertain the little ones; poor Mrs Sotherby, her daughter, is so delicate.'

'I think we must be playing at cross-purposes. The young lady I mean never could be a grandmother. She wore a high black dress, and had deep, dark eyes.'

'Perhaps you mean Hester Carew. Mamma would have her in to dinner to-day, because we were thirteen—a mystic number. She lives with us, and has gone to bed now, I daresay, poor child! Do you like music, Mr Allen?'

'Yes; very much,' replied I, noting much the change in Miss Merritt's manner when she spoke of Hester. We walked side by side over to the piano, and there, with her gauzy blue dress spread

round like a gigantic hyacinth, sat Carrie, a group of gentlemen beside her, for other friends had dropped in to the evening-party.

'What shall I sing?' Carrie was asking. Two or three songs were named; and Carrie exclaimed quickly: 'As none of you agree, I'll sing my last new song, my special favourite just now.'

That song I am doomed to remember, for I have many a time since heard it sung by dearer lips than Carrie Merritt's.

AIDS OF SCIENCE IN THE DETECTION OF CRIME.

As cannot but be generally known, the photographic art has been largely employed to insure the detection of crime. Our principal police-offices have photographs of habitual evil-doers, who by this means can be easily tracked out and pounced upon when wanted. A man may change his name, and almost as easily change his dress, but he cannot well change the shape of his nose, his eyebrows, and other features. Wherever he settles down, he runs a chance of being found out. This we consider a great triumph. Photography becomes an important aid to the general system of police.

Going into a more minute consideration of the subject, we come to cases in which the nefarious use of poisons may be detected and brought to light. Here, chemical science plays an important part. The marvellous delicacy of tests, and the perfection to which the process of analysis has been carried in the case of the poisons more easily accessible to the public at large, have together left the poisoner no loophole of escape, so far as the detection of the noxious substance is concerned. Of course, the circumstantial or other evidence of poisoning may fail, and the criminal may thus escape; but the art of the chemist rarely, if ever, falls short of its due work in proving the presence of the substance in question. The entire range of poisons, however, has not yet been overtaken by chemical science. Year by year the poisoner has been driven to narrower and narrower limits in the choice of substances for his nefarious purpose; and so far as the mere detection of poisons is concerned, it may be said that the criminals of the future will have to seek in the class of poisons derived from the organic world, the aids to their crime. By organic poisons we mean those prepared from plant or animal substances; and confessedly, chemistry as well as medical science has yet much to learn, not only respecting the action of such substances, but regarding their detection and characters also. It is fortunate, however, that such subtle poisons as strychnia and its compounds, the forms of digitalis (obtained from foxglove) or atropia (obtained from the deadly nightshade), represent the very substances which are either difficult or absolutely impossible to be procured by ordinary or non-scientific persons. And to this latter fact, society in great measure owes its immunity from crimes committed by agencies the detection of which, in some cases, has baffled the most advanced chemical science of our day.

Entering the domain of the microscopist, we naturally find the objects therein presented of less technical character than those which concern the chemist. A crime, let us suppose, has been committed, and in the course of the evidence

appertaining thereto, certain suspicious marks or stains resembling blood are observed, say on the dress of the accused person. The establishment of the entire case for or against the accused, may perchance depend upon the answer which the microscope gives to the question regarding the nature of these stains; and it can well be estimated how important a matter, in the hands of the man of science, the work of this instrument becomes. For example—as in a case which actually occurred in the practice of the great German medical jurist, the late Professor Casper of Berlin—it became a matter of great importance to distinguish the blood of man from that of birds—a task to the performance of which the microscope is quite equal, as will be presently explained. Or upon a knife or other weapon, as has occasionally happened, some hairs have been found. It may go very far to prove, or disprove, a most serious crime, if the exact nature and characters of these hairs can be ascertained; for, in an actual case of murder tried in England, the question, whether or not certain hairs found upon a hammer were human hairs, had the most vital bearings upon the guilt or innocence of the prisoner. The identity of shreds of cotton, of fibres of silk, or of other materials, with fibres taken from the dress of the accused person, or from the victim of his crime, may similarly possess important relations to the great question at issue; and these relations can only be determined by the patience and skill of the microscopist.

Although the importance of microscopic work in the detection of crime may be fairly and generally admitted, it is yet a matter of fact that very gross misconceptions prevail in the popular mind regarding the extent or limitation of the microscopist's powers. By some, for example, these powers may be deemed of very limited kind; whilst by others their nature may be maintained to be illimitable. The truth is, that microscopic science, like every other branch of inquiry, is progressive in its character; and whilst great advances have been made upon the science of the past, it may fairly be expected that the future improvements of our microscopes will enable research to proceed to an extent wholly unattainable at present. And it must also be noted, that the knowledge of anatomy and physiology necessary to the understanding of the objects which the microscope reveals, together with the improvement of that knowledge, form considerations of equal importance with the perfection of the mere mechanical details of the instrument.

The distinctions between the *hairs* of man and those of lower animals, have been ascertained with tolerable exactitude. The want of such knowledge may sometimes lead to grave mistakes; a fact exemplified by one instance in which a person was arrested on suspicion of having murdered another; a hatchet having blood and hairs adherent to it being found in his possession. Microscopical examination of the hairs, however, shewed that they were not those of man, but of some animal; and this fact, together with subsequent testimony, obtained in consequence of the microscopic evidence, tended to acquit the accused. Certain woollen fibres, exhibiting a dark dye of peculiar kind, on another occasion were found mingled with blood which had dried upon a knife used to commit a murder. The identity of these fibres with those of a coat worn by the accused person, formed a strong

fact of circumstantial nature against him. We can thus readily distinguish and separate silk, linen, and cotton fibres respectively. Those of linen exhibit a rectilinear or straight and tapering appearance, whilst these fibres are also jointed at irregular or unequal intervals. Silk fibres are recognised by their simple cylindrical form, and by their want of characteristic markings; whilst the woollen fibre is of irregular symmetry and of unequal thickness, and exhibits on its surface markings of a twisted form. It is equally interesting to observe, that fibres taken from very ancient garments present the characteristic appearances of modern fabrics. The linen fibres from a mummy-cloth, and the woollen ones from the shroud of a person burned in the fourteenth century, were found on examination to present the same recognisable characters as their modern representative fabrics.

The characters of human hair are very distinct and characteristic; those of the eyelashes being of thicker structure and coarser texture than those of the head. The microscope may even shew us if a hair has been bruised or otherwise maltreated; since, in such cases, the delicate sheath of the hair will be seen to be torn or frayed. The hairs of such animals as the horse and cow can, even by aid of an ordinary magnifying-glass, be distinguished from human hairs; although notably in some dogs, such as the spaniels, the hair may sometimes approach very closely to the human type. The hairs of the rabbit and hare exhibit, when microscopically examined, a crossed appearance, produced by numerous little cells or divisions running across each hair; and it is notable that animals (such as the squirrel and rat) belonging to the same order of mammals as the rabbit, exhibit a similar pattern in their hairs.

The detection of blood-stains, and more especially the determination of the animal from which they have most probably been derived, forms a subject obviously of greater importance than that of the microscopic examination of hairs. The physician or microscopist, on being shewn a stain of reddish colour, has in the first instance to assure himself that it is really blood, and not simply iron-mould, or other substances which may more or less closely resemble the vital fluid. Certain chemical tests will most satisfactorily determine this first point; but under certain circumstances, the microscope is the only available and satisfactory means of answering both questions at once.

When a very thin film of human blood is pressed between two plates of glass, as in ordinary microscopic work, and examined under a tolerably high power of the instrument, the well-known red fluid is seen in reality to consist of a perfectly colourless liquid known as the *serum*, and of an immense number of minute solid particles floating in this liquid. These latter particles are the *blood-corpuscles*; the vast majority of these bodies appearing of a reddish-yellow hue, whilst a few are seen to be of white colour. The white blood-globules measure each about $\frac{1}{1000}$ th of an inch in diameter; that of the more numerous red globules averaging $\frac{1}{2000}$ th of an inch. The red colour of the blood is thus seen to be entirely due to the presence of these little globules, which exist in such numbers, that the fluid presents to the unassisted sight a uniformly red appearance. The blood of

all animals contains corpuscles or globules of one kind or another; and it is from the different characters presented by the blood-globules of different animals, that the microscopist is enabled to distinguish the vital fluid of one form from that of another.

Confining our remarks to the case of the higher or vertebrated animals, which begin with the fishes as their lowest representatives, and pass through reptiles and birds, and quadrupeds or mammals, up to man himself, we find that the microscopist is at once enabled, through peculiarities of structure, to distinguish the blood of *mammals*—including man, of course—from that of the fishes, reptiles, and birds. Thus, when we examine the blood-globules of the three latter groups, and lay aside variations in size, we find them to be invariably oval or elliptical in shape; whilst those of mammals are circular in form—save, curiously enough, in the camel tribe, in which the blood-globules are oval. Thus, no one may, even in respect of shape, mistake the blood of man or of any quadruped, except the camels and llamas, for that of any lower animal. But a more important distinction may readily be found between the blood of the lower vertebrata, and that of man and mammalia. Within each blood-globule of fish, reptile, or bird, a little central particle, known as the *nucleus*, is found. The red blood-globules of all mammalia, including the camels, never contain any such central particle; and it is from the invariable absence of this nucleus or ‘central spot,’ that the microscopist can decisively pronounce his verdict that such blood-globules must belong to man or some other mammal, and to no other group of animals. A patient, feigning spitting of blood, was thus detected in her imposture, by the physician seeing, on microscopic examination, that the blood contained oval nucleated globules, presenting the characters of those of birds. The patient’s surprise on being informed that her stratagem was discovered, may be readily imagined. And, similarly, the defence in a case of murder was partly broken down by its being shewn that blood alleged by the prisoner to be that of a fish was in reality that of a mammal.

But it may be urged, that whilst the microscopic test holds good in separating the blood of the mammals from that of birds and still lower forms, there still remain the possibility and probability of confusing the blood of one mammal with that of another. It may thus be asked if the microscope can shew us any essential distinctions between the blood of man and that of the animals to which he is most nearly related? Here, however, we begin to approach the limitation of the microscopist’s powers; for—excepting, of course, the case of the camels and their allies—we have now to trust to the test of the *relative sizes* of the blood-globules of different mammals, to enable us to distinguish those of the human being from those of the quadruped. And confessedly, the test of size is one which, besides being in all cases of doubtful application, can hardly be applied or extended to very practical or decisive ends. The blood-globules may further vary in size in the same animal; and this latter fact, of itself, almost entirely vitiates the efficacy of the test. Then also, the size of the blood-globules of quadrupeds bears no relation whatever to the size of their respective bodies; and in this respect, the blood-

globules of a horse and a mouse are of nearly similar size; whilst those of man, the dog, and the rabbit, are all nearly identical in dimensions. Nor does the age of any given animal seem to affect the size of its blood-globules; for in the embryo or young form, they are as large as those of the adult.

Thus, practically, no microscopist would venture to state positively, when shewn two specimens of blood—taken from the dog and man respectively—which was the human, and which the canine blood. In the musk-deer, the blood-corpuscles are the smallest that are known in any living animal, being each, on an average, about $\frac{1}{100}$ of an inch in diameter; and in this and other exceptional cases, the test of size might prove to be of practical utility; but whether or not the science of the future may reveal to us other modes of discerning differences between the blood-globules of mammals, this latter test will always be regarded as subject to error and dispute.

In cases, therefore, in which blood may have been proved to be at least that of some mammal, the microscopist must avow his inability to proceed a step farther with certainty. Not unfrequently the straining of scientific evidence in our courts of law on this very point, has met with severe and just rebuke; and such instances are clearly to be taken as merely the expressions either of ignorance or credulity, since they can in no sense be held to represent the opinions of the earnest and practised microscopist, who knows too well the limitations of his powers.

With all these limitations, however, microscopic science can boast of many important advances in aiding the law-administrator in his protection of human life and interests; and it should form no unimportant test of the value of such knowledge, that, whilst serving as a means of culture, and of interesting us in the structure of the lower forms of life, it should also be capable of being extended to the preservation of the best interests of society at large.

THE INDIAN JACKAL.

THE Indian jackal in general appearance much resembles the Indian wolf, though in size considerably smaller. I have often mistaken a female wolf, when some distance off, for a jackal, and *vice versa*. The fur, which is seldom smooth or glossy, but more often coarse, ill-conditioned, and mangy, varies much in shade, some specimens having much darker coats than others. The general colour of the upper part of the body is rusty brown, intermixed with hair of a darker tint, and grizzled with gray. Below, the fur is lighter in colour. Extreme length, from point of nose to tip of tail, about three feet. The tail, of a deep brown colour, and darker at the tip, is not nearly so long in proportion to the body as that of the fox, nor is the hair covering it so dense or soft, but shorter and more bristly, and hardly worthy the name of ‘a brush.’ The animal is gregarious, though seldom more than five or six are seen together. Nocturnal in habits, it sallies forth at sunset in search of food, feeding chiefly on the carcasses of cattle, offal, bones, and, in fact, acts the part of a general scavenger. Occasionally, a jackal will pull down a goat or sheep, and the young of these animals are often carried off in broad daylight. I have known puppies stolen, and

geedhur (as the jackal is called by the natives) often commits fearful havoc among poultry, by forcing an entrance into a hen-roost, even when door and window have been carefully closed and secured. Generally speaking, when successful in getting in, the animal is not content with making a meal off a single turkey, duck, or fowl, but likely enough will slay six or eight before taking his departure. He is also most destructive to game; the young of deer and antelope, hares, peafowl, partridges and quail, one and all fall a prey. Hares are generally surprised in their seats; though I have known a full-grown hare regularly coursed and run down on open ground by a single jackal; this, however, was an exceptional occurrence, and the more general plan adopted by the animal is to stealthily approach and spring upon puss unawares when seated in her form, or while engaged in feeding. Peafowl are often caught in a similar manner, more especially in the neighbourhood of pools of water: these birds almost invariably make use of the same path when passing to and fro from the jungle to water; and jackals, aware of this practice, lie in wait for them towards sunset in the vicinity of drinking-fountains, well knowing that, after a hot day, the peafowl, parched with thirst, will be certain to put in an early appearance.

Though generally nocturnal in habits, at certain times of the year, more especially in the rainy season, it is nothing unusual to come across a jackal in broad daylight. At the hottest period of the year, the animals may not unfrequently be seen lying panting under the shade of a patch of bushes, or behind a tussock of grass. The traveller by rail, if an observer, can hardly omit noticing this circumstance from the carriage-window, as he is whirled along through the dried-up plains of Bengal. In large towns, such as Calcutta or Bombay, these animals are exceedingly numerous, and make most useful scavengers. At night, in the streets of Calcutta, dozens of jackals may be seen skulking about in a single alley, though never collected together in a pack. During the day they retire into the drains and sewers of the city, or seek shelter in small archways under bridges, and there remain hidden till nightfall, when again they issue forth, and spread themselves over the town in every direction.

Jackals generally breed in burrows in the ground, sometimes in drains or in hollows under piles of rocks and boulders; the female usually has four or five cubs at a birth, born blind, but the young things are soon able to move about and follow the dam.

Although the females bring forth their young in such spots as just described, yet the jackal does not, like the fox, habitually live in holes excavated in the ground, but prefers rather a thick patch of sugar-cane or clump of high grass as a place of concealment during the day. It often frequents thick matted reeds and rushes bordering on ponds and swamps, especially during the hot-weather months.

The cry of the jackal is a series of loud and most disagreeable yelps and shrieks, nowhere heard to greater perfection than after nightfall in the streets and lanes of large towns. A pair of the animals can raise such an unearthly outcry, and with such a variation of sounds, that any one unacquainted with the vocal powers of the brutes would be led to imagine that at least a dozen,

instead of only two or three, were assisting in the chorus. A single animal usually commences the concert with a long-drawn doleful wail; this appears to act as the signal and key-note for every following *geedhur* within hearing to 'strike up,' and take his part in the melody; and immediately the air resounds with the yells and cries of half-a-score of jackals. The harmony continues, each moment increasing in vehemence, for perhaps a minute or two, and then gradually dies away, much to the relief of the inhabitants of houses anywhere near. Then dead silence reigns for perhaps half an hour or more, till some wretched brute afar off commences again with the prolonged opening howl, the prelude to another odious clamour. To add to this hideous din, dogs of all kinds, especially village pariahs, join in the nocturnal music, so that to any one newly arrived in the country the noise becomes unbearable, and sleep impossible.

Like the wolf, the jackal is a difficult animal to render altogether tame, even when reared and kindly treated from a cub till full grown. It is naturally of a suspicious and distrustful disposition, and seldom, like the dog, displays any genuine affection for or attachment to its master. European soldiers in India frequently have their barracks filled with various pets, such as monkeys, mungoes, badgers, dogs; sometimes, but rarely, wolves and jackals; and I have seen hyenas, besides antelopes, deer, and perhaps a regimental bear, chained up outside. I remember constantly meeting with a private soldier belonging to the 106th, at Jhansi, accompanied by a full-grown and exceptionally tame jackal trotting at his heels; this animal was unusually docile and confiding, permitting any one to pat and caress him, though careful to keep close to his protector on the approach of one of the numerous barrack dogs.

The sense of smell is exceedingly acute in the jackal, enabling the animal to detect its natural food from afar; and it is extraordinary how speedily the carcass of a bullock or carrion of any kind is discovered, and with what rapidity the body disappears. Many a murder never comes to light in Eastern countries from this cause: the perpetrators of the crime have only to place the corpse of their victim in some out-of-the-way though exposed position, and speedily keen-eyed vultures, hungry hyenas and jackals, will assemble, and in the space of a few hours or less remove every proof of the deed, leaving little trace to mark the spot. Like the hyena, the jackal is a regular attendant on, and profits by the leavings of the tiger, panther, and other carnivora, and readily makes a meal off the remains of dead bullocks, deer, &c.

Not only does perfection in the power of smell enable the thieftous jackal to discover where the carcass is, but it also assists him in hunting down such victims as wounded antelope and deer. The little tyrant, when going his nightly rounds, aided by the power of his olfactory organs, becomes aware of a not far distant prey; makes diligent search for and speedily discovers the stricken animal, even when herded with its comrades (though, generally speaking, a wounded antelope separates from its companions), and so persistently follows it, that the unfortunate creature, stiff from its wounds, and weakened by loss of blood, soon becomes exhausted, and nearly

always eventually succumb to the perseverance of its ravenous pursuer. Many years ago, when stationed at Agra, a pair of jackals in broad daylight joined in the chase of a crippled ravine-buck which I had severely wounded with a bullet, and greatly assisted me in retrieving the quarry. It happened thus: the gazelle, an animal remarkable for extraordinary tenacity of life, had dropped apparently dead to my shot, but while reloading, it suddenly regained its legs, and, to my surprise, though evidently mortally wounded, made off at speed. I pursued, and did my utmost to keep the creature in sight, but in vain, for I soon lost sight of it among a maze of ravines bordering the river Jumna close by. Presently, while following the tracks, I was surprised to observe a pair of jackals in front of me with their noses to the ground, evidently hunting, and probably engaged in the same chase as myself; and a few minutes later, on rounding a turn in the nullah (dried water-course), I came right upon the blood-stained pair busy worrying at the buck, which they had already killed and much torn. At first they actually seemed loath to surrender the prize; but a stone sent at them drove them away. Possibly, it was the smell or the sight of blood that had attracted the jackals, and induced them to hunt this particular antelope; instinct telling them that the creature was injured, and that, therefore, they might succeed in running it down. Though, had the gazelle been uninjured, and in full vigour, they never would have attempted pursuing so swift an animal, knowing full well how easily the nimble little creature can, under ordinary circumstances, escape from their clutches, and with hardly an effort leave them far behind.

The natives of India believe in 'a solitary jackal,' which, from its singular harsh cry, they call the *phéall*, and which they declare invariably accompanies, or is accompanied by a tiger or other wild beast; and it has been stated by some writers that this extraordinary call of the *phéall* is never heard but in parts of the country infested by the larger carnivora. This statement, however, is somewhat at variance with my own personal experience, for not once or twice, but repeatedly when quartered at Jhansi, I have heard this peculiar yell or call within the precincts of the cantonment, once in my own garden close to the house; and I need hardly say that no tiger or wild beast of any kind (except now and then a skulking hyena) dared to venture so near to the dwellings of man. On the other hand, I must confess that I never once remember hearing the cry of the *phéall* in Calcutta, or in the vicinity of any other large town where jackals abound; a fact which would seem to favour the 'solitary' theory. There can be no doubt, however, as to the animal which utters this particular call, for I have heard the cry, and immediately afterwards shot the animal, which proved to be a veritable jackal.

Some animals, such as the panther, for instance, during the pairing season, give out a peculiar cry at that particular period; and we know that during the rutting season stags bellow. Possibly this peculiar call of the jackal, which has attracted so much attention, may be attributed to some such signal or call between the sexes. I have noticed that dogs become intensely excited on hearing the cry of the *phéall* (the unearthly yell of the

hyena has a similar effect); and my English setter, who, beyond a low growl, would take little or no notice of a whole pack of shrieking jackals close to the house, would immediately, on the very first cry of the 'solitary' jackal, even when far away, spring to his feet, with the hair on his back bristling erect, and rush out of the house barking furiously.

Jackals often suffer from hydrophobia, and at such times become dangerous, for, instead of avoiding human beings, as is their ordinary wont, they will sometimes viciously attack wayfarers. Many years ago, when a wing of my regiment was stationed at Cachar, one of our sepoy sentries broke his musket while endeavouring to despatch a mad jackal that approached his post during the night; and it is nothing unusual to hear of natives dying a miserable death from the effects of a bite.

That the jackal can at times be bold and mischievous, the following anecdote will illustrate. I kept half-a-dozen milch-goats when quartered at Jhansi, which were allowed to graze unrestrained in the compound, or on the banks of a stream near the back of my residence, where one would have imagined that, during the daytime at anyrate, they could come to no harm. Early one afternoon in the month of August, I was seated in the verandah of my bungalow busily engaged preparing a despatch for the English mail, when my bearer and dhobie (washerman) came running up full of excitement, and informed me that only a few minutes previously, an animal, which they believed to be a wolf, had seized one of the goats; and that, when compelled to quit his hold by the approach of human beings, he had taken refuge under a narrow archway beneath a bridge close to the spot, from whence probably he had just before emerged. On further inquiry, it appeared that my washerman, while busily employed at his usual vocation (namely, hanging his master's shirts by way of cleansing them, and much to the detriment of the buttons, against a flat stone in the water), presently had his attention arrested by piteous cries of distress from the direction of the heel of goats; and on looking over his shoulder, to his astonishment beheld an animal which he declared to have been a wolf grappling with one of the flock, and dragging it down the bank of the stream. He ran forward, shouting; and the brute, on his near approach, relinquished his prey, and, as already stated, sought shelter under the low archway of a bridge hard by.

On examination, with the exception of a slight tear on the neck, the goat, in spite of the rough treatment she had undergone, appeared to have escaped serious injury. The next thing was to punish so bold a marauder. I loaded a double rifle, and in company with a number of natives, directed the dhobie to shew the way. We reached the bridge in a few minutes, and as it was impossible to see down the dark narrow tunnel beneath, half choked up as it was with weeds and sand, I directed one of my followers to procure a long stick with which to stir up our friend, and compel him to shew himself and leave his hiding-place. Presently the man returned with a bamboo, and almost immediately after forcing the pole up the one entrance of the arch, out bolted, not a wolf, but a very large jackal, from the other. A gun loaded with a charge of shot would have been a better weapon than the rifle I held in my hand.

However, after missing him clean with the right barrel, as he scudded off, I made rather a neat shot with the left, and bowled him over. On a closer inspection, the animal proved to be a male jackal of the common type, but of such unwonted size, that on viewing its thick muscular body and long gaunt limbs, I wondered little at the blunder committed by my servant in mistaking it for a wolf; and indeed, the formidable set of teeth which garnished the jaws would have done credit to even that animal.

I may mention in conclusion, that many classes of the natives of India (who are a superstitious race in general) dread hearing the cry of a single jackal when uttered in close proximity to a dwelling, asserting that it denotes 'a death' before long in that particular abode. And in former times, prior to Thuggee being put down by the English government, a fox crossing the path of a gang of Thugs about to start on an expedition, and on the look-out for propitious signs, or the contrary, was regarded as the very worst token of all for success, and a certain warning, should the enterprise be persisted in, of failure and disaster.

FALLEN FORTUNES.

CHAPTER X.—A TRUE WIFE.

WHEN we poor sons of men are miserable, we are prone to think that we have reached a depth of distress beyond that which the experience of others has sounded, and are approaching the very limit—and even exceeding it, since in despair we often seek refuge in the grave—which human nature can bear. The gentleman who has just been black-balled at the long-desired club; the lady to whom the Lord Chamberlain has refused permission to present herself at Her Majesty's Drawing-room; the business man who finds himself unable to meet his engagements on the morrow; the wife who has just discovered the unfaithfulness of her husband: all these, although suffering such different degrees of woe, imagine that not in the condemned cell of Newgate itself is to be found a mortal so utterly forsaken by the gods as they. It is the poor privilege of the wretched to exaggerate their calamities, and perhaps John Dalton indulged himself in this way like the rest. Yet it is difficult to imagine that that autumn morning dawned upon a human creature more wholly miserable than he, as he crept down the thick carpeted stairs and along the painted corridors of Riverside to his own room. Everything about him breathed of wealth and luxury, while every thought within him pictured ruin. Hour after hour, he had sat alone till the cold gray light had broken over the crags of Bleabarrow, but not one ray of comfort had fallen upon him; he had racked his brain for a single gleam of hope wherewith to mitigate the gloom of that confession, which he must now needs make to his unsuspecting wife, and had found none. He had prayed, and his prayer had come back to him, as it seemed, rejected. There are agonies in which the impatient soul demands some visible sign of God's good providence, and being denied it, it dares to question His existence. There was no help for him, he cried in his exceeding bitterness, in God or man. As for himself, he was ready to own that he did not deserve such help; and if he had stood alone in the world, he would have taken his

punishment, doggedly perhaps, but without repining or complaint. He was no coward, though in that dark hour (as generally happens) his very vivacity of spirits, quickened by long years of prosperity and success, shewed its seamy side, and made him proportionably prone to despondency; but his apprehensions for the fate of those he loved, and whom his folly had dragged down to the dust, were overwhelming.

His delicate and devoted wife; Kitty, with her beauty and expectations; Jenny, prostrated by her illness, and for whom until now everything had been done to prevent even the winds of heaven from visiting her too roughly; little Tony, with his education but just begun, and looking forward to being an Eton boy: each of these pictures, to gaze on which had hitherto been the pride of his life, was now become to him terrible to look upon; and yet, alas, they were living realities. The prospect was not to be evaded or shut out; not one of these beloved portraits could he turn with its face to the wall.

As he drew near his dressing-room, his step fell more lightly on the carpet, and he turned the handle of the door very softly, lest his wife, who slept in the next apartment, should be disturbed. His intention was on no account to waken her, but to suffer her to sleep on until near her usual hour for being called, when he must needs tell her his ill news. It would be the last sleep free from care that she would ever have; and as for him, there was small chance of his losing consciousness of his woes even for a moment. To his surprise, however, on entering his dressing-room, the window-curtains of which were of course closed, excluding the dawn, he perceived a strong light under the door that communicated with the next apartment. At the same moment he heard his name called in those dear accents the sound of which had hitherto been ever as music to his ear. Now, they only evoked a shudder. Without trusting himself to answer, for he was sensible that he had lost control over his own tones, he summoned up a smile, and opened the door. To his great distress, he found Mrs Dalton had not retired to her couch, but was sitting in her dressing-gown, awaiting him—as she had doubtless been for the last six hours.

'My dearest love, how can you be so imprudent?'

He was careful for her health at all times, and there was an especial reason for her taking care of it for the next few months to come; for the moment, he only thought of that, and not of the sad burden of woe which he had come to share with her.

'I could not sleep, dear,' said she tenderly, 'until I had seen you, and heard from your own lips what it was that has troubled you so.'

Here, as it might seem, was his opportunity of gently breaking to her his terrible news; but no sooner did it present itself than his courage failed him. What hurry was there, after all, to introduce this innocent and unsuspecting creature to irreparable calamity? He had made up his mind, indeed, to do so that very morning, but it now struck him that there was no need for such great haste as that. The blow, indeed, must fall, but it would not do so immediately, and it was his duty to prepare her for it by gradations. Any sudden shock to one in her delicate situation might have a serious effect, and was to be avoided. Though death was sweet to himself, because of the evil that he had wrought

her, he shrank from contemplating it—miserable though her life might be—in connection with her.

‘My darling, you alarm me beyond measure: to lose your natural rest, is to do yourself, just now, a serious injury. My news, whatever it be, might surely wait for the morning.’

‘I must know what it is, John, I must indeed,’ pleaded she; and she rose from her chair, and placing a thin white hand upon each of his shoulders, looked straight into his eyes. ‘Do not tell me it was the election only. Have I known and loved you all these years not to know better than that? Thank God, you are well!—in health at least—and the children are well. If I had not had them under my own eye to-night, I should have thought, when I looked upon your face, that there was something amiss with them. What else, John, can have happened to so change you?’

‘To change me, Edith? I flattered myself my manner was much the same to-night as usual. But it is quite true that something has happened to trouble me.’

‘Then it is a mere money trouble?’

‘It is a money trouble, but a very severe one.’

‘Thank God, thank God, it is no worse!’ said Mrs Dalton fervently. ‘That nothing of blame or shame could be laid to your door, I knew; but I was apprehensive—I always have been—that your connection with Mr Holt might lead you into some painful position. Your reference to him in your letter of this morning made me uneasy. None of us like the man: we are only women, moved by instinct, and not by reason; but since such a feeling was common to all three of us’—

‘There seemed something in it, eh, my darling?’ observed Dalton, finishing the uncompleted sentence. He found his task much easier now than he could have hoped for. What his wife had said was strangely consonant with his own recent thoughts. He knew that Holt was no favourite with her or with the girls, but he had no idea that they entertained any such suspicions of him—unreasonable, as she herself had said, yet suspicions which he shared. In her case, however, he did not wish that they should be corroborated; it was better she should feel he had been ruined by his own folly than another’s fraud, even if there had been fraud.

‘I know nothing against Holt’s honesty, my dear,’ continued he gravely. ‘But I did not wish you to speak to him about the election, lest you should have heard something from his lips, which should be told only by my own. It was most essential to me, as I thought when I wrote that note, to succeed at Bampton; my credit—by which I mean my commercial importance—would be seriously affected by the result; but now all that has sunk into insignificance, in the presence of an overwhelming calamity.’

‘You have lost your fortune, John!’ Her tone was grave, but very soft and gentle, and there was a smile of content upon her face, very strange to see at such a time.

‘Yes, dear, I have; God help me: every farthing of it.’

‘But you have not lost us, John; I am still with you’—her voice trembled a little, but she went bravely on—‘and the dear children.’

‘Yes, darling; it is on your account and theirs—not on mine, God knows—that this has un-

nerved me; that the burden seems more heavy than I can bear.’

‘Then let us help you to carry it; what is heavy for one is light for four. The girls are old enough, and wise enough, to bear their part. What is the loss of money when love is left!’

‘Edith, Edith! you know not what you say; you have not pictured to yourself what ruin is. Did you not hear me say that I have lost my all?—and, Heaven forgive me, your all also!’

She sank down in the chair, for her limbs had failed her, still retaining his hand within her own. ‘I did not understand,’ said she in a faint voice; ‘God help us!’

‘Even she, devoted as she is, cannot image to herself,’ thought he, ‘my fatal folly, and forgive it; such a baseness as I have committed is inconceivable to her innocent and unselfish nature; I am condemned by the sole judge to whom I could have looked for mercy.’ How wrong he was, how little he knew her, notwithstanding that he loved her so! When we stand before the judgment-seat of Heaven itself, we may know—I trust we shall—a diviner pity, but here on earth there is no such unstinting fount of ruth and forgiveness as the heart of woman.

‘Pardon me, dear John,’ were her first broken words; ‘the weakness has passed now; and I feel as befits your wife. Yes; and I would not change my place to-night, this moment, taking his head within her hands, for he had cast himself upon his knees at her feet, and hidden his face in an agony of remorse and shame, ‘with that of any woman in this world, no matter how rich—how prosperous! And I love you, John, better in your poverty and your ruin, than I have ever loved you yet; and I will be true to you, and be your help—as help may be in me—and so will Kate and Jenny.’

Then she broke down. She could have borne all herself, but the thought of her children, and what they would have to bear, was too much for her mother’s heart. Husband and wife mingled their tears together—bitter tears of self-condemnation in the one case, and of tenderness and pity in the other. ‘Hush!’ said she, for the grief of a man who has not shed a tear since childhood is always loud; ‘Jenny is a light sleeper; and she pointed to the door that led into the room of the invalid. ‘Now, tell me all about it, John; I can bear to hear it much better than I can bear to wait. I know the worst; how can it hurt me, then, to know the shape in which it has come! Nay, it’s idle to talk of rest, of sleep; I pray you, tell me.’

So, sitting hand in hand, John Dalton told her all, omitting only his suspicions concerning Holt.

She listened attentively—asking a question calmly here and there, when she required some matter of business to be explained—to the bitter end.

‘Then if the bad news about the mine should not be confirmed,’ said she, ‘our affairs would not be so desperate!’

‘They are already confirmed, Edith: do not, I beseech you, indulge in any hope on that head. The mine was a swindle from the beginning.’

‘Yet Mr Holt persuaded you to invest in it?’

‘Certainly: he thought it a genuine thing and a very good thing; he purchased largely in it himself; that I know of my own personal knowledge.’

‘And yet he sold his shares afterwards?’

'Yes; but at a high premium. If I had followed his advice, I am bound to say I should have made money by it. I had taken—I don't know why, unless it was from what he had originally told me—a fatal fancy to the investment.'

'And to whom did Mr Holt sell his shares?'

'I don't know; it was doubtless done through a broker, and he may not even know himself. Why do you ask that question?'

'From ignorance, my dear. I understand no more of such matters than our little Tony.'

'Poor boy!' sighed Dalton despondently. The mention of his son brought keenly to his mind that sense of ruin which this discussion about the *Lara* had for the moment diverted from it.

'Well, darling, we must look about us,' said Mrs Dalton cheerfully, 'and plan what is to be done. A man of your talents, who has got so many influential friends, need not surely long remain without some lucrative employment.'

John Dalton had had some experience of place-hunting, though not upon his own account, and he knew that in that description of sport the 'blank days' were many, and that those even of the most skilful huntsmen who 'find' at all are few. The humiliation of beggary would be terrible to him, and how often would he have to beg and be refused.

'There are the Skiptons, you know, darling; they have always been such friends of ours, and Sir William, who is in the ministry, would surely exert himself for your sake.'

Her husband shook his head, as though he did not entertain much hope of assistance from that quarter. Sir William, although he was the Attorney-general, was a dull man, and Dalton had more than once expressed his opinion to that effect—of course in the politest possible manner—when they chanced to differ. Their families were very intimate, but the men themselves were as opposite as the poles, and had no very high opinion of one another. Twenty-four hours ago, it would have seemed as impossible to Dalton to have asked a favour of Sir William Skipton, as to pick his pocket; he would not have done it, had he been starving. But the question now was whether he could bring himself to do it, to provide bread for his children.

'Then there is Cousin Tatham, John; I am sure he has always expressed the highest admiration of your talents.'

Poor Dalton winced at this. Lord Tatham, a distant relative of his wife, was a venerable nobleman who enjoyed a certain insignificant appointment about the court; and though, from his appearance of wisdom and gravity, he might have sat upon the woolstack to represent the Lord Chancellor in his absence, he was, in fact, a nonentity; a mere stuffed personage with a bagwig and sword. He was, it is true, always talking about his patronage, but it was only the appointment of the royal footmen that lay within his gift.

While Mrs Dalton thus imagined to herself that the court and the ministry would both be interested in her husband's favour, he himself was rapidly reviewing in his own mind all the really possible chances that were open to him, and they seemed few indeed. He had friends, it is true, upon whom he could rely for sympathy, and even, perhaps, for material aid—though in a

shape which, even now, he could not conceive himself capable of accepting—but they were men of his own style and character, genial, agreeable fellows, but who had, with few exceptions, never sought to burden themselves with the duties, and therefore the privileges of office. He felt that they could have nothing to give him in the way of employment. He had a slight acquaintance, indeed, with a minister or two beside Sir William, but he had always attached himself to the other faction in politics, and it was unreasonable to expect that his late attempt upon the virtue of the borough of Bampton, though it had failed, would recommend him to their good offices.

Nothing very practical, indeed, came out of the long discussion that took place that weary morning, concerning future ways and means, between husband and wife, yet Dalton found an unexpected solace in it.

He had never before taken Edith into his confidence upon the state of his affairs; and her sagacity and common-sense, wherever her knowledge of the grounds upon which to build was equal to his own, surprised him. We do not give the angels such credit for aptitude for worldly wisdom, as perhaps they deserve. Mrs Dalton's views were doubtless sanguine; she had much more confidence not only in her husband's friends, but in his own abilities, than he had himself; but if sympathy is not help, it is next akin to it, and hope begets hope; and before their talk was over, Dalton was certainly in a less despairing mood than he had been some hours ago.

Though his wife had suggested much, she had stipulated but one thing—namely, that their misfortune should, if possible, be kept from the knowledge of their children until their return to their own home. 'Let them enjoy themselves for the few days that remain of our visit here, John; it will be easier to break this news when we are all together under our own roof; nor do I wish, unless you see any good reason to the contrary, that our host and hostess should learn what has befallen us, while we remain their guests.'

It was out of the true mother's heart, we may be sure, that the first advice was given; but of the source of the second, I am not so certain—perhaps it was a little womanly pride. Her connection with the Campdens had always been on equal terms, and she shrank, though the change must needs come sooner or later, from its being placed on another footing. Or, perhaps, she thought that Julia would not prove the most sympathising of friends at such a crisis.

To both conditions, Dalton would have willingly assented, but he feigned objections in order to gain compliance, by giving way, with a stipulation of his own—namely, that Edith should retire to rest for the little time that now intervened before her usual hour for being called. To this, she was with difficulty persuaded, and presently, worn out by watching, and weariness and woe, she fell asleep.

As the daylight struggled in, and lit up her delicate wan face, as it lay beside his own, a new fear crept into his aching heart, and mingled with its other tenants. Suppose that his faithful and beloved companion should perish in her coming trial, and leave him *alone* in the dark days to come! The thought was agonising, but only in consonance with those which already beset him. That worst, at which, when we have arrived,

it is said that 'things must mend,' he felt was limitless in evil. There are times when poor humanity rejects the smooth prophecy, 'Heaven will never desert me so utterly as to suffer this to happen or that;' but, with sickening fear, expects the utmost cruelty of Fate.

EAST END AND WEST END.

AMONG the 'working clergy' of London, there are few who are better known than the Rev. Harry Jones, late rector of St Luke's, St James', and at present incumbent of St George's in the East. He has known very literally 'St Giles' and St James', and is well qualified to speak of both; and his transition from West to East of the great metropolis has given him the opportunity of drawing a most interesting comparison between them.* When he came to dwell in East London, he found many curious contrasts with the district which he had left. He was now among ships, just arrived from long voyages, with numerous foreigners speaking a strange language. This contrast of faces and apparel, 'this mixture of land and water, of homely trucks and foreign traders, of horse-vans and steam-vessels; the tier of huge ocean-going ships, brought so close to the shore that you can touch their long black sides with your stick or umbrella,' as you walk by them, produces a sense of proximity to the ends of the earth, and adds to the above-mentioned sense of space. Our author is convinced that this affects the thinking powers of the inhabitants, and renders them more catholic, and less prejudiced. And yet the poor folk in the East are very hardly worked, so that they have less time for thought than most of us. With the exception of the coarse enjoyments of the sailors, there are few pleasures to be found there, and none of an ambitious sort. No one dreams of a carriage-riding, nor indeed of a carriage. 'Here have I never seen a coachman in a wig, or a footman in powder. I have never met a lady on horseback or a "Victoria;" and though we go so much about on foot, such a luxury as a crossing-sweeper is unknown.' There is no 'London season' in the East, but only summer and winter. Town is never full or empty, but always the same. What is very curious is, that the exception to this uniformity is on the annual race-day between Oxford and Cambridge, 'when the loneliest and dullest street breaks out in blue ribbons, and the van-horses toiling up Old Gravel Lane from the Docks wear their colour.' We fancy this does not arise so much from sympathy with our University institutions on the part of the East-enders, as from their association with the River, by which many of them, in two senses, live. The Thames—no 'silent highway' in this locality—brings with it their occupation. Their livelihood, in very many cases, although they live on shore, depends upon the winds and tides. When the wind brings the ships, every one has his hands

full of work; but when it blows against them, the dock-labourers stand idle at the gates. The wealth that lies in the huge, ugly storehouses in this region, or hidden among 'the square plantations of bare masts,' is inconceivable, while the wares themselves are of the most poetic and sumptuous kind. Without, is Wapping; within, is the Arabian Nights. 'Here are stores of ebony and ivory. Here are the choicest cigars, the richest drugs, the brightest dyes, the sweetest perfumes, and the finest wines. . . . Pinea from the West Indies, oranges from Seville, teas from China, masses of ice from Norway, marbles from Carrara, and spices from Ceylon.' All the products of the world are to be found within a few square feet of one another. Walk round the little dock of St Catharine, and here you shall see ten thousand bags of coffee, and here seven hundred and fifty thousand pounds worth of indigo, and here thousands of fagots of cinnamon scenting the air. Sometimes you may come upon things that do not exactly scent the air, such as half-a-dozen wagon-loads of asafetida, which, it seems, is used as a condiment in Persia, and thought capital with beefsteaks. At other times, you may stumble upon a quantity of 'old-fashioned trunks, with the hair outside,' which are cow-skin packages full of quinine bark, sewn up with thongs. Then there are the wine-vaults at the Docks, where most of us have gone when we were middle-aged and foolish, with a 'tasting order,' and repented of it. For one thing, there are no less than 'six acres of port, sherry, and madeira, and, under one roof, sixty thousand huge casks of brandy, worth, on the average, seventy pounds apiece.' In the Docks is maintained a standing army of three hundred cats to kill the rats which swarm there, besides many human auxiliaries who get their living by clearing the freshly unladen ships of these vermin. The charge for 'ratting a ship' is a pound; but the rats are caught alive and sold for twopence apiece to 'sporting gents;' so that the calling is remunerative.

In the longest vault of the London Docks, the iron rails on which the casks are rolled reach altogether twenty-two miles! The alleys, however, are narrow. All along the track, the ceiling is black with fungus. But there are worse things than that to look at and think about. 'The sugar, molasses, and treacle-stores in the Docks are anything but appetising. One day,' says our author, 'I was walking along the huge sheds on the ground floor, where all this sweet stuff is lodged, and saw a parcel of men scraping the floor with hoes, much in the same way as the scavengers do the streets. And the mud they scraped up was very black. On my asking what they did with it, one of the superintendents told me it was going to be made into lollipops.' It is fortunate that *East and West London* is not a book likely to be very popular in juvenile circles, else this disclosure would be alarming indeed.

The East of London, while in the very van of the time in many respects, retains some of our oldest institutions. The curfew, for example, is still tolled at St George's, and in fulfilment of its original design. When the clock strikes eight, the bell 'goes' for a quarter of an hour, and gives the signal for turning off the gas in various work-shops. At a quarter before six in the morning, too, it begins a designedly irregular clang—very

* *East and West London*. By the Rev. Harry Jones. Smith and Elder.

pleasant for the poor rector who lives under the shadow of the belfry—to awaken the East-end workers. 'The tower is so close that I can hear the rattle of the rope and the groan of the wheel before each metallic "boom." And when the last stroke of six has been struck in a storm of accompanying clangour from the heavy alarm-bell, the air long remains filled with an angry hum, as though the emperor of all the hornets was flying about the room.' Such is one of the pleasures of shepherding a 'working population.' But Mr Harry Jones does not mind work, or any of its associations. Indeed, he likes it so much, that he is easily angered against the drones. He informs us rather grudgingly that fifteen of the City churches—which an inquisitive but accurate friend of his attended for the purpose of taking a census of their congregations—have for the sum-total of their attendants (barring the charity-schools) two hundred and ninety-one individuals, or less than twenty apiece. 'Their priests frequently live away, perhaps in the pleasant places of the country, and on Sunday come up to their cures with two sermons in a little black bag.' Some of the livings are of considerable value, but the main sum is out of sight, consisting, as it usually does, of the proceeds of their 'parsonage,' let at a very high rent for business purposes. 'It has been estimated that the parochial charities of the City could, without serious inconvenience to any one, produce two million pounds—enough, according to an estimate of Sir Sidney Waterlow, to provide sufficient sites for as many improved dwellings for working-people as are needed in the metropolis.'

Of the newspaper literature of the inhabitants of the East, our author gives a very humorous account. No print over a penny in price is in circulation there. 'We file the *Times* in the vestry, but it is too dear for local use. I take it in, but, unless I ordered it, I could not get a copy at any of our local newspaper shops. I fancied, however, that I had found a neighbour with a special literary or political interest in the leading journal. My copy of the *Times* goes on the second day to a worthy butcher hard by, to whom it thus comes cheap. On one or two occasions, however, when I wanted to refer to something in the copy of the previous day, and sent to beg the loan of it, I found that it had been torn up. The truth gradually revealed itself to me, that my practical neighbour preferred the *Times* because of the toughness of its paper. He desires to have the news, but is content to get it rather late if printed on material tenacious enough to hold small parcels of meat without bursting.' The East, indeed, is not very 'cultivated' as respects literature, or very 'æsthetic' as respects religion, but, as a rule, it is neither graceless nor godless; 'a district is not necessarily degraded because it has no opera-house, polo club, or footman in powder,' and, it may be added, only one *Times* newspaper. 'It is distinguished,' boasts its chief pastor, 'by a steady and laborious discharge of duty, which before God is of great price.' We are afraid that, in our author's eyes, 'the Eastern Position,' about which such a fuss is being made by people who don't know what real parochial work—not to say real religion—means, is of small importance compared with such an Eastern fact as this. Moreover, despite the poverty of his new parishioners in St George's in the East, they beg much less than do

the poor in St George's Hanover Square. Their manners on the whole are good; there is not much courtesying or touching of hats, but a certain frankness and pleasantness of address, which a right-thinking man calls wholesome. There are not many actual 'roughs' in the district, though many of the population are 'conspicuously the reverse of smooth;' and our author is a judge of roughs. He has been in some queer places in his time, and seen queer people, for he is the sort of priest that shrinks from going nowhere if upon his Master's errand, and as such he has come to the conclusion that even in the 'ugliest corners' people are inclined to be civil to you if you are civil to them.

There are a good many things, indeed, in this book, both about 'East' and 'West,' that are calculated to astonish even moderately strong minds. Herein may be read in brief the whole history of the working-man, including his club, which some good folks thought could be carried on by the subscriptions of the aristocracy. The one which Mr Harry Jones started was self-supporting from the first, bought its own liquors, its own billiard-table (it has now two), and had its own servants. 'It was for some time found cheaper to send to an eating-house than keep a cook; but now the cooking is done as at the Athenæum or Reform Clubs, though we have not had a Francatelli or a Soyer. . . . Once or twice I was asked to dinner there, and had a very good meal and a kindly welcome.' This is a writer who knows the working-man well; and one of the causes to which he attributes the growing vice of drunkenness is very curious, and we have no doubt worth notice. It is the monotony of trade, the universal division of labour. Work is now so subdivided that a man gets tied down to the ceaseless repetition of a particular process. A bootmaker does not make boots, he only fastens the 'upper' to the 'sole;' a 'closer' does the stitching. This is the same with all trades. Human nature abhors the tedium of it, and 'breaks out.' Then there is want of air, want of amusement, and above all things, the degrading influence of a crowded lodging. It is hopeless to expect the light of education, morality, religion, or whatever else is best, to keep alive in that tainted air. The wholesome dwelling-house is his great remedy for much that is amiss; and when one reads what he has to plead in behalf of it, how idle are all the questions that convulse the so-called 'religious world' beside this simple need, which can mainly be met by the pocket. However, these matters are only touched upon in the book before us, though, as it seems to us, with a master-hand.

We should like to be with the rector when he presides over the annual drawing of the lots of the six marriageable maidens from 'Raine's Charity,' the lucky one of whom gets a hundred pounds as a dowry. Mr Raine left his money away from his nephews, well convinced, as he sets forth in his will, that if they had seen, as he had, the innocent maid who got the prize burst out into tears of joy, they would have been quite content with that disposition of his property! But 'how about the five poor innocent maids,' inquires our author, 'who don't get it?' and who have all provided themselves with suitors, some of whom may cry 'off' when they have drawn

blanks. Sentiment, to suit Mr Jones' taste, must be of a nature to stand 'frying,' and we wish there were more folks of his opinion.

Space forbids us to speak further of this excellent book, save to quote one singular fact. If Mr Harry Jones is not a lion, he is very near one. 'I suppose that there is no other place in the world where a domesticated parson could ring his bell and send his servant round the corner to buy a lion. I could indulge this whim at five minutes' notice.' The fact is, he is neighbour to Mr Jamrach, the great wild-beast collector. At present, in the East of London the market is high for tigers, which cannot be bought under two hundred pounds; whereas a lion fetches but seventy pounds, and a lioness even less. You may buy orang-outangs for twenty pounds apiece; and even these are not the most remarkable inhabitants of East London.

A RAILWAY RUN.

ONE day in August of last year I travelled from Paddington to Exeter by the eleven forty-five train on the Great Western Railway. By the courtesy of the management, I was permitted to travel in any portion of the train at pleasure, and to ask any questions respecting the working of the line, the signals, &c., of any of the officials. The eleven forty-five A.M. express is the fastest train in the world; and when I saw the huge and powerful engine on which my journey had to be performed, a slight feeling of nervousness came over me, because I then realised that, like it or not, having once started, there was no help for it but to remain where I was for seventy-seven miles. One glance, however, at the face of the polite engine-driver, Mr Price, was quite sufficient to reassure me, for there I saw clearly written, not only courage, but skill. The guard's whistle sounds, and I take my place on the foot-plate of the engine. We go slowly until we clear the outskirts of the station, and notwithstanding the great weight of the engine (28 tons), we have a few bumps over the points; when, however, we are clear of these little obstructions, it becomes quite evident that our iron monster means business. With a jaunty shake of his funnel, as much as to say, 'Look out, I'm coming!' he increases his speed; the telegraph posts begin to fly past; the whirl, tear, and crash of the engine get louder, so that with difficulty I can hear myself speak, and the speed becomes so great that I am fain to hold on, for very fear that I shall be shot off like a stone from a catapult. Onward still faster, for we are in the open country, with miles of straight road before us; and now, were it not that we have profound confidence in the skill of those who laid down the rails, we should feel convinced that the said rails must be torn up—that nothing can keep them secure against the great speed and power of the monster engine. All this time the engineer, with placid face, keeps a sharp look-out with his hand on the controlling lever, ready at any moment for action, should any obstacle occur; whilst the cheery-faced stoker (a veritable Mr Toodles in

appearance) every few minutes heaps great shovelfuls of coal into the jaws of the furnace. Just as we are going at a high speed, something appears to require adjustment near the funnel of the engine. With as much coolness as you or I would cross Hungerford Bridge, our engineer walks over the side of the monster, and gives two or three turns to a screw—just as we are approaching a sharp curve on an embankment twenty feet high. I look upon his destruction as inevitable; hold on doubly tightly myself, under the certain impression that he, and most likely all of us, will be shot over. But no; he quickly returns, as if the speed were of no importance to him, and as if all such things were mere matters of course.

Presently, when we have accomplished about half our distance, the speed seems to flag a little, whereupon our engineer turns a couple of small screws at his feet: the effect is immediate and startling: fast as we were going before, the speed now is something terrific, and it requires an occasional glance at Mr Price's placid face to reassure me that all is right.

People riding in railway trains, and seated comfortably in their carriages, have but a faint notion of the great speed at which they actually go when travelling by express. You must be on the engine, with nothing before you but a couple of small and apparently fragile iron rails, which it seems must be torn up, before you can have the least idea of what railway travelling actually is. On the broad gauge, owing to the great size and weight of the engine, there is comparatively little jolting and vibration; for when going at the greatest speed, I am able to pour out a glass of wine without spilling a drop. At length, we slacken speed, and Swindon Station comes in view, which we reach, having performed the run of 77½ miles from Paddington, without stopping, in a little more than an hour and a quarter. Here, I take leave of my engine friends, having ascertained that the engine is called the 'Estafette'; that it was born in September 1850, and renewed June 1870; that it is one of the, if not the best and most powerful on the line; that it weighs 38 tons 8 cwt.; and that during its lifetime it has travelled 666,605 miles—or considerably more than half a million!

Pursuing my plan, I next enter the quarters of Mr Jones, the guard, who tells me he has conducted the express for twenty years; and 'I've never, sir,' says he, 'had any accident, not even to take the skin off my finger!' I learn some useful facts from Mr Jones, and get some interesting anecdotes. He too seems to have eyes in every side of his head, so constantly is he on the look-out. 'Don't you think, guard,' say I, 'that the trains ought to keep better time? They are frequently very much behind.' 'Well, sir,' he replies, 'it's pretty nearly entirely the fault of the public. Passengers are greatly offended if we don't wait for them when we see them running to catch the train. It only keeps you a minute, they say; but just consider, sir—now, there's a parliamentary train to-night leaving Cornwall which will have to stop at eighty stations; and suppose we are only a minute, or even half a minute, behind at each station—see how that tells up—and, of course, you know that we must wait the advertised time before we start.

Depend upon it, it's the people's own fault; because passengers won't keep their time.' Knowing how often I have only allowed a minute to catch a train, I feel that what Mr Jones says is true, and am rebuked accordingly.

'Another cause of want of punctuality,' says the guard, 'is the fluctuating nature of the passenger traffic. The very train in which we are travelling affords a remarkable instance of this. For some weeks the passengers leaving Paddington have been counted, and the fluctuation is really remarkable. On the first week of counting—on Monday, 90 passengers travelled; Tuesday, 116; Wednesday, 91; Thursday, 131; Friday, 56; Saturday, 172. And the variations are not affected, as you might suppose, by the days of the week. Without a sufficient knowledge of the subject, one would naturally say: "Oh, everybody knows that more people travel on a Saturday, and the railways ought to make preparation accordingly." But mark the actual truth. One week, 173 passengers travel on a Saturday; the next, 188; and the third, only 125; whilst on one Friday, 56; on the next, 200; and on the third, only 60. And when we consider that not five minutes before the starting of the train do the railway officials know how many passengers they have to provide carriages for, we must admit that it is wonderful that trains start with even an approach to punctuality—as increased numbers mean not only a crush at the booking-place, and additional carriages to the train, but also an increase in the luggage to be labelled, and a heavy tax upon the energies of all the employés.'

I learn a good deal more from my friend the guard; and amongst other matters, he tells me that passengers are in error when they imagine that the latter part of the train is the best to travel in. 'People make a mistake, sir,' he says, 'when they try to get as far from the engine as they can—the first three or four carriages are the safest.'

I obtained much valuable experience from my trip; and after a most exciting but pleasant run of four hours and a quarter, reached Exeter, where I horrified an hotel waiter by presenting myself with a face like a coal-heaver's.

I should like to conclude with a few remarks of a practical nature. Railway managers often get more blame than they are entitled to, and are made responsible for accidents over which they really have not the slightest control. Captain Tyler, whose experience is very great, remarks, 'that whatever the amount of care taken, the item of human fallibility will always remain, and will always be the cause of a certain number of accidents.' Yet, taking into consideration the enormous number of travellers who go by rail, one must admit that accidents are comparatively few.

It will be interesting to glance at the amount of traffic on one or two of the lines.

The average number of trains running on each week-day over the Metropolitan extension of the Chatham and Dover line (twelve miles) is 546; and the number of passengers conveyed over those twelve miles during six months is over seven millions. The Metropolitan Railway conveyed on Whit-Monday last over 244,000 persons. During the Whitsun week, over 1,088,000 passengers travelled on that underground line. One-sixteenth of the entire population of London made use of

this railway in one day, without an accident. In the busiest time of an ordinary day—that is to say, between nine and ten in the morning—a train passes over the line every forty-three seconds, or seven trains in five minutes. In the course of the day, 768 trains have to run backwards and forwards. Safety is secured by insuring not an interval of time but of space between the several trains, which is arranged by the operation of what is known as the Spagnioletti system of signals. During twelve years, 294,258,535 persons have travelled by 'underground.'

During a single twelvemonth, the Great Western Railway ran 255,986 trains; some of them contained seven hundred passengers; and it is not an uncommon thing for an excursion-train in three parts—each part containing six or seven hundred passengers—to arrive within a short time of each other at the terminus. Every train has its record—the time it starts, the time it arrives and departs from each station on its way, the time it passes every signal-post. Thus, the manager, if you ask him, will turn to a book, and tell you that of the 255,986 trains just alluded to, 138,646 arrived at their destination punctually to the minute; 48,785 not more than five minutes late; and so on. There is no room in the present paper to allude to signalling, a system daily improving in its working, and gradually becoming more and more perfect.

MOON SHT.

I love the sunset's glowing ray,
The 'sober evening's twilight gray.'
But yet more beautiful to me
The calm moon setting in the sea.
Unlike the sun, who fills alone
His grand but solitary throne,
The tranquil empress of the deep,
While Nature sleeps a dreamless sleep,
Not unattended seeks her rest
Upon old Ocean's heaving breast.
Her starry courtiers placed on high,
A shining cortege, through the sky,
In stately, slow procession glide,
Reflected by the dimpling tide.
While, as she glides her downward way,
Silence assumes a stiller sway,
And broods like the Eternal Love
O'er all below, around, above.

Soon crossing the horizon's verge,
Her disk, half-hidden by the surge,
Reflects a still decreasing light,
Then dips, and disappears from sight.
The stars, whose paling rays are seen
Nearest in order to their queen,
Ere in her wake they plunge below,
Pause, as if half-afraid to go,
Suspended in a transient rest
Upon the billows' snowy crest;
Until the perfumed breeze of night
Breaks the reflection of their light,
When lo! they vanish, one by one,
Like torches when a feast is done.

LESSEPS AND THE SUEZ CANAL.

GREAT and unforeseen events often spring from what appear to be very insignificant circumstances. Such has been the case with the Suez Canal, about which everybody has been lately talking, and the execution of which is undoubtedly the most momentous engineering feat of our time. To know precisely how there should have been such a grand undertaking projected, we have to carry the mind back to the early years of the present century, when the French endeavoured to effect the conquest of Egypt. Ruffled in the attempt, Bonaparte, as First Consul, still retained an interest in Egyptian affairs, with a view, possibly, to some advantageous political movement. Assisted by Talleyrand, his minister of foreign relations, he appointed a M. de Lesseps to act as French agent at Cairo. For the world at large it was a fortunate appointment. Lesseps was an able man, as discreet as he was intelligent. He did good service to France by contributing to the elevation of Mehemet Ali Pacha to the viceroyship of Egypt. Mehemet Ali, as is well known, had arrived in the country a poor man, unable to read or write, but he was naturally acute, and resolute as a soldier, he rose to power by the destruction of the Mamelukes. They were slain at Cairo, to the number of sixteen hundred—only one of them escaping, by leaping over the ramparts on horseback—on the 1st of March 1811.

We do not know how long M. de Lesseps remained in Egypt. He certainly did not relinquish his connection with France, for there, at Versailles, he had a son born to him, November 19, 1805. To this son, Ferdinand de Lesseps, we have now to call attention. Well educated, and with tastes for diplomacy and engineering, he, from the very dawn of intelligence, heard Egypt spoken of, and felt interested in that country, to which in due time he proceeded as French agent. In this capacity, on account of the memory of his father, he received many marks of attention from Mehemet Ali, who, with all his imperfections, may be called the regenerator of Egypt. Ali, at

his decease, was succeeded by his adopted son, Ibrahim Pacha, who was chiefly noted for his military exploits. Ibrahim was succeeded by Abbas Pacha, who promoted the railway from Alexandria to Cairo, which gave Egypt a fresh impetus. Next comes the son of Mehemet Ali, Saïd Pacha, also an improver, who succeeded to power in 1854. It is not unnecessary to give these particulars, for they materially bear on the subject.

By a happy conjuncture of circumstances, M. de Lesseps was brought into acquaintanceship with a succession of viceroys, and acquired an intimate knowledge of Egypt, its language and manners—we might add its capacity for physical and commercial improvement. During his residence in the country, he pondered on the practicability of making a ship-canal to connect the Mediterranean with the Red Sea. The idea was not quite new. In ancient times, under the regime of the Pharaohs, a canal was constructed between the Nile and the Red Sea, the remains of which, dry and blocked up with sand, are still here and there visible. The project of Lesseps was on a vastly grander scale. It was nothing less than to form a canal without locks or other interruptions, straight along from sea to sea, capable of bearing the large ships which usually sail or steam to and from India. The water for the canal was not to be derived from lakes or rivers, but to be the water of the two seas. The ocean was to be let in at each end, so as to meet and form a salt-water channel, such as might have been formed by nature. It was a fine conception, but only applicable to a district unobstructed by rocks or mountains. There was reason to believe that part of the desert to be traversed, and more particularly that adjoining the Red Sea, had at one time been a salt-water lagoon, of which there were evidences in certain hollows, which, though dried up, were still covered with an incrustation of salt.

Why a ship-canal from sea to sea had not been long since effected, was to be explained by the political condition of Egypt, and the jealousy of rival powers, but still more by the prevalent belief that there was a difference of level between the

Red Sea and the Mediterranean. Lesseps felt satisfied that there was no difference in the levels, and that with the aids offered by steam and the electric telegraph, there would be no difficulty in conducting the traffic on a wide and well-constructed canal. The only serious obstruction was of a political and financial, not a physical nature.

It will be understood that the object of the canal was to accommodate and develop the traffic between Europe and India. In the course of ages, that traffic had undergone some remarkable changes. For several centuries, the commerce with the East had been overland through Asia, thence by sea to Venice, and so onward by land to the Netherlands and north of Europe. The discovery of a passage to India by the Cape of Good Hope in 1486 put an end to this tedious and costly traffic. Ships now sailed direct for India, and in effect the commerce of the world was revolutionised. Venice, Nuremberg, Antwerp, Bruges, and other marts of eastern commerce, sunk into comparative obscurity. There, matters have remained until our own times. The heavy traffic of Europe with India has been chiefly by sea, round the Cape of Good Hope, while the transit of passengers has only of later years been facilitated by the railway from Alexandria to Cairo and Suez. The project of Lesseps was designed to effect a fresh revolution in the traffic with the East. It was intended to do away with the long sea-passage by the Cape, and by the construction of a canal for ships, make Africa into an island. The design was magnificent and worthy of English engineers, but they left it to the more lively conceptions of a Frenchman. Let us see how Lesseps went to work.

Released from diplomatic duties, and returning to Europe, he devoted himself to the study of oriental questions, his mind naturally turning to the possibility of piercing the Isthmus of Suez. In his frankly characteristic lecture at Paris in 1870, translated by Sir Henry Drummond Wolff, M.P., and lately published,* he says: 'From 1849 to 1854, I studied everything connected with the trade between the West and the East. I discovered that the traffic doubled every ten years, and that the time had arrived at which the formation of a company for the construction of the Suez Canal could develop that traffic in a marvellous manner.' Impressed with the importance of his design, he went to Egypt on the accession of Mehemet Saïd in 1854. Having in various ways been serviceable to Saïd, with whom he had established a warm friendship, hopes were entertained that the project might at length be sanctioned. Visiting Saïd when on a military excursion across the Libyan Desert, he broached the subject, and spoke of what could be done by financial associations. It was further essential to conciliate the good-will of the viceroy's intimate associates, 'who were more skilful in the exercise of the horse than of the

brain.' An opportunity having occurred, 'I presented myself,' says Lesseps, 'at the tent of the viceroy, placed on an eminence surrounded by a wall of rough stones, forming a little fortification with embrasures for cannon. I had remarked that there was a place where one could leap a horse over the parapet, there being a terrace outside, on which the horse had the chance of a footing. The viceroy welcomed my project, and requested me to go to my tent to prepare a report for him, which he permitted me to bring him. His councillors and generals were around him. I vaulted on my horse, which leaped the parapet, galloped down the slope, and then brought me back to the inclosure when I had taken the time necessary to draw up the Report, which had been ready for several years. The whole question was clearly set forth in a page and a half; and when the Prince himself had read it to his followers, accompanying it with a translation in Turkish, and had asked their advice, he received the unanimous answer that the proposal of the guest, whose friendship for the family of Mehemet Ali was known, could not be otherwise than favourable, and that it was desirable to accept it.' As a result of this auspicious interview, the concession to make the canal was granted on the 30th November 1854. Now came a regular exploration of the isthmus, to settle upon the proper route. Besides M. de Lesseps, the party of explorers were three French engineers; the party of four requiring at least sixty camels to carry water and provisions, and conducted by a suitable body of attendants. Among the stores taken were live sheep and fowls.

Speaking of the route that was traversed, M. de Lesseps says that, beyond the live animals taken, 'there was not even a fly in this hideous desert.' He adds, by way of illustration: 'At night we opened the cages of our fowls, full of confidence, for we were sure that next morning all our beasts would come round us, not to be abandoned in these desolate places where solitude is death. When we struck our camp of a morning, if at the moment of departure a hen had lurked behind, pecking at the foot of a tamarisk shrub, quick she would jump up frightened on the back of a camel to regain her cage.' The journey of exploration lasted two months. After all, it was found desirable to submit the question of route to a Commission of skilled engineers of different countries, who, after due investigation, met along with Lesseps at Alexandria, where they were received at the gates of his palace by the viceroy. A touching scene ensued. When Saïd learned that the Commission considered the canal was possible by channeling the isthmus from sea to sea, without having recourse to the water of the Nile, 'he threw himself,' says Lesseps, 'into my arms, and shewed the liveliest satisfaction.' Furnished with a definite act of concession in his favour, that received the sanction of the Sultan, and which empowered him to form a company to execute the canal, this heroic Frenchman returned to Europe,

* *History of the Suez Canal.* Blackwood and Sons, 1876.

to stir up the public mind, and induce capitalists to take shares in the undertaking.

The difficulties he encountered in his mission were enough to have discouraged a man of less spirit and determination. Some of the more influential English engineers were of opinion that the operations for dredging, to keep the canal and its access from the Mediterranean clear of mud, would be so enormous as to render the project financially valueless. Then, there arose objections, jealousies, and hesitations, on the ground, that to aid the undertaking would be to play into the hands of a French Company—or, more probably, the French government. It is painful to look back to the speeches in parliament on the subject. On the 7th July 1857, Lord Palmerston said: 'The obvious political tendency of the undertaking is to render more easy the separation of Egypt from Turkey. It is founded also on remote speculations with regard to easier access to our Indian possessions, which I need not more distinctly shadow forth, because they will be obvious to anybody who pays any attention to the subject. I can only express my surprise that M. Ferdinand de Lesseps should have reckoned so much on the credulity of English capitalists as to think that by his progress through the different commercial towns in this country he should succeed in obtaining English money for the promotion of a scheme which is every way so adverse and hostile to British interests.' Ten days later, his lordship characterised the project as 'one of the bubble schemes which are often set on foot to induce English capitalists to embark their money in enterprises which in the end will only leave them poorer, whoever else they make richer.' These severe and unworthy remarks did not meet general approval, but their effect was discouraging. The susceptibilities of Lesseps were grievously wounded. With a degree of bitterness, he observes in his lecture: 'Lord Palmerston represented me as a species of pickpocket, wishing to take the shareholders' money out of their pockets.' It appears to us surprising that Lord Palmerston did not perceive and appreciate the immense facilities that the canal would offer to British intercourse with the East. Advantages of this kind were at once recognised by various Chambers of Commerce, and also by the Press. The cynical conduct of the government, however, could not be got over. In short, it substantially threw the undertaking into the hands of the French, to whom, along with the viceregal administration of Egypt, belongs the glory of making the Suez Canal. A little more generous consideration would have given a share in its accomplishment to the people of Great Britain.

From the very first, it was the wish of M. de Lesseps to give the undertaking an international character. The Company formed was entitled the *Compagnie Universelle du Canal Maritime de Suez*. It was stipulated in the articles that the canal was 'to be open always as a neutral passage to every commercial vessel crossing from one sea to the other, without any distinction, exclusion, or preference of persons or nationalities.' Further, 'that the Company cannot, in any case, grant to any ship, company, or person, any advantages or power not granted to other ships.' According to the stipulations of the concession, a stripe of land on each side of the canal should belong to the Company, for canal purposes, for ninety-nine

years. The Company being formed, and money provided by twenty-five thousand French subscribers, and by the Egyptian government, the works commenced in April 1859, and were prosecuted with great vigour. These works embraced a vast variety of accessories to the undertaking—piers, harbours, light-houses, dwellings for thousands of labourers—in fact, all the appliances of modern civilisation in a district which was an utter wilderness, without a blade of grass or a drop of fresh water. The thing could not have been done at all without the prompt and liberal assistance of Saïd, and afterwards of Ismail, who succeeded to power in 1863. A subsidiary undertaking, but one which became imperative in the circumstances, was the forming a canal fifty miles in length to bring fresh-water from the Nile to a central spot where was built the Company's town of Ismailia. For the excavating of this fresh-water canal, there were for a time employed as many as eighty thousand men, furnished by the Paclia. On the great salt-water canal, the works were on a stupendous scale. For one thing, two hundred and eighty-five dredging-machines were working with a steam force of eighteen thousand horses, consuming twelve thousand tons of coal per month. It is difficult for any one to realise the magnitude of the effort to excavate a track across the wild sandy desert from sea to sea, ninety-nine miles in length, and sufficiently broad and deep to float the larger class of ships. The quantity of stuff lifted and carried off amounted to about two millions seven hundred and sixty-three thousand cubic yards monthly—as much, M. de Lesseps said to his Parisian audience, 'as would cover the whole of the Boulevard from the Madeleine to the Bastille as high as the first-floor of the houses.' He added: 'Let us do justice to the men of science and of courage who executed this immense labour. They have deserved well of their country and of civilisation.'

The excavation and works of the canal generally occupied ten and a half years, during which M. de Lesseps was constantly at hand to give advice and tide over difficulties. At length, all was ready for the day of inauguration, which took place ceremoniously in presence of numerous invited guests, including Eugénie, Empress of the French, in November 1869. It is unnecessary to speak of the rejoicings on the occasion. Such was the excellence of the arrangements, that vessels of large size sailed across the desert from sea to sea. The triumph of art was complete. Ships for India, China, and Australia did not any longer require to spend time in rounding the Cape of Good Hope. By a short-cut, they could reach the Southern Ocean, and much time and expense could be saved. On the day of the formal opening, what a proud man must have been M. de Lesseps. Despite every obstacle, his dreams, pronounced visionary, had at length been realised.

Let us say a few words concerning the nature of this extraordinary canal. It crosses the desert to the east of Alexandria, at a place now called Port Saïd, where vessels sailing into properly prepared basins get into the appointed channel, and where there are steam-tugs to help them if required. The course pursued in a southerly direction is for about thirty-one miles perfectly straight, the width at the surface of the water being three hundred and twenty-seven feet, and seventy-two feet at the

bottom, with a depth of twenty-six feet. This measurement prevails over nearly three-fourths of the canal. Passing the forty-first mile, the canal makes a bend to Lake Timsah; the bending being due to the practicability of cutting through some sand-hills. Lake Timsah—only a lake by the sea having been let in—may be called the central station. Here, on the west side, we come to Ismailia, with the fresh-water canal and railway from Cairo, both of which continue at no great distance all the way to Suez. At the fifty-third mile, we reach the Great Bitter Lake, which is connected with the Little Bitter Lake, the two together measuring about twenty miles in length. Like Lake Timsah, they are nothing more than natural depressions in the sand filled with sea-water to the ordinary depth of the canal, the fair-way being cleared by dredging. At the seventy-third mile, we get on the canal, which now pursues a straight line to Suez—not that it touches the town, but makes a curve eastward, and ends at Port Ibrahim, in the Gulf of Suez, a portion of the Red Sea. Along the whole route there are defined stations, houses of officials, and the electric telegraph, with mooring-posts, and other accommodations. To avoid a congestion of traffic, the transit is placed under strict regulations, and usually occupies sixteen hours. Apprehensions as to the difference of levels of the two seas have proved entirely groundless. At each end the tides exert an appropriate influence. If anything, there is a current from the Red Sea; but as it meets a wind from the north, it does not affect the navigation. Fears as to the drifting of sand into the canal have likewise been greatly exaggerated. Along the sides of the fresh-water canal, trees have been planted; these, when grown, will serve to condense the clouds and draw rain; wherefore, we may expect that at no distant date the desert will assume the character of a green and fertile region.*

Since the inauguration of the canal in 1869, no instance has occurred of any stoppage of traffic. Daily, vessels of different kinds have safely made the passage, the steamers making their own way, and sailing-vessels being drawn by tugs. Anticipations concerning the traffic have been more than realised. Merchants and ship-owners have quite appreciated the advantage of a rapid voyage to and from India, not only as regards less tear and wear, and less expenses, but the saving of insurance. Against such advantages there are the demands made by the Company, in the shape of dues levied on the tonnage of vessels, and other charges. But, although these form a heavy outlay, they seem to have no serious effect in diminishing the traffic. The truth is, the traffic is already trenching on the capacity of the canal, and it may soon be a serious question whether the channel should not be enlarged. In approaching Port Said by sea, we observe strings of vessels standing their turn, as it were, to get into the harbour and canal, and in all cases they have to abide by rules as to following slowly one after the other, and at certain places stopping to let vessels pass which come in a contrary direction. According to a recent Report of the traffic, thirty-

three vessels have been in the passage in one day. On the 27th of last July there were four hundred and thirty-two vessels on their way to the canal in one direction or other. By far the larger number of vessels using the canal are British—the actual proportion being eighteen British out of every twenty-five vessels; that is to say, the people whose government pooh-poohed the whole concern are its best customers.

In 1873, the number of British vessels using the canal was eight hundred and ten, while of French there were only eighty-three, and of Austrian seventy; the number for other nationalities being comparatively small. The great advantage to owners of British vessels trading to and from India is pointedly stated by M. de Lesseps. 'A vessel sailing from Bombay passes through the canal, and leaves its cargo of cotton on the quays of Liverpool. The cotton, immediately sent to Manchester, is manufactured; and, nine days later, the ship, with its former cargo in a manufactured state, again sets sail, and returns to India by the canal. Thus, it has been found possible, in seventy days, to bring the raw cotton from India, to unload in England, and to send it back manufactured to India.' He might also have instanced the rapidity with which British government transports, each carrying a whole regiment, can now make the passage by the canal to Bombay, instead of by the tedious voyage round the Cape, or the cumbrous transshipment by the overland route.

The original estimated expense of the canal was four millions sterling; but the outlay has been nearly double that amount, exclusive of a very heavy expenditure by Egypt on Port Said, graving-docks at Suez, and other things of a less or more remunerative character. It is believed that as much as nineteen millions have been altogether expended in connection with the undertaking. In becoming aware of this fact, one would be disposed to admire the enterprise and generosity of the Egyptian government, in contributing almost four-fifths of the expense, without an immediate prospect of adequate remuneration. Unfortunately, most of the money was borrowed at a high rate of interest, and it seems not unlikely that the Khedive, from financial exigencies, will find it desirable to dispose of much, if not the whole, of his interest in the concern, including the reversion of the property at a prescribed period.

It has been stated, as indicative of the revenue, that the canal dues for the first ten days of January 1876 amounted to £32,000. But whether the traffic will be sufficient to remunerate the Company, is not easily seen. Besides the original capital raised by shares, and by loans at interest, there is a continual and onerous expenditure for dredging and for facing the banks with stone or concrete. Perhaps the heaviest outlay of all is caused by operations in keeping clear the entrance at Port Said, for the sea in this quarter is constantly receiving accessions of mud brought down by the Nile, and driven ashore by northerly breezes. But for the operations of an enormous dredging-machine, which is constantly ploughing a track in the sea half a mile long and two hundred yards broad, the entrance to the canal would soon be silted up, and alluvial land added to the coast of Egypt. From these and other

* A remarkably good chart of the Suez Canal, from Admiralty and French surveys, along with a descriptive account, has been published by George Philip and Son, 32 Fleet Street, London.

circumstances, the Suez Canal is evidently more to be esteemed as a maritime highway valuable to the world at large, and to Great Britain in particular, than as a commercial speculation. M. de Lesseps deserves the thanks of the nationalities—of all friends to human progress—more than the members of the Company of which he is the head. Latterly, he has spoken with gratification of the purchase by the British government from the Khedive of shares to the value of four millions; and it must have been little less soothing to his feelings to know that the canal was used by the *Serapis* in conveying the Prince of Wales to India. In both particulars, the opposition so unhappily offered by Lord Palmerston, may be said to be atoned for.

w. c.

LOCHVIEW.

A TALE IN THREE PARTS.—PART II.

THE next morning found me true to my purpose of beginning work in earnest, and I rose early, that no time might be lost. I had visions of spending the long hours of the day in bending over columns of figures and adding up vast sums and totals. I longed to herd with rich merchants in the Exchange, and hear them talk of stocks and dividends, of speculations and profits, and all the yet unknown mysteries of vigorous, heart-stirring business. No racehorse, kept back by rider and barrier, ever panted more eagerly to set forth on its course than I did. I longed to run side by side with those who were trying for high prizes.

So it was rather a disappointment to find the breakfast-room empty when I entered it. I believe I expected to find Mr Forbes and his son Dick there, snatching at an early breakfast, ere they set off for the office, hardly giving themselves time to swallow a decent meal. But nothing was to be seen of either of them. The table-cloth was laid, however, and there seemed some signs of preparation, so I stepped out of the low window into the garden, to pass away the time till all was ready. Like most other town gardens, this one was prim and formal in the extreme. A square grass-plot filled up the middle—smooth and well kept—and croquet wires at even distances, shewed that the game was sometimes played there. Round the sides were standard rose-trees, and here and there white statues held up their burdens of terra-cotta vases, filled with blue lobelia and scarlet geraniums. At the lower end of the garden, a vigorous attempt had evidently been made to form a fruit inclosure. Some pear-trees of a pyramidal training put forth puny branches, with a scanty display of unlovely looking fruit, and a few espalier apple and plum trees gave promise of a meagre future harvest. I examined all this in my ramble, and contrasted it mentally with the rich, over-abundant crop that was even then ripening in the sunshine in our Lochview gardens. The flowers and fruit there seemed altogether of a different nature to this puny growth in a town garden. When I grew tired of rambling about, I walked up round by the side-path to the low window, and looked in to see if

breakfast was ready. Hester Carew was in the room; I recognised her *petite*, slender figure at once, with the well-shaped head and graceful outline. Her side-face was towards me, and she was bending over the table, putting some finishing touches to its arrangements. Perhaps it was wrong of me thus to gaze unobserved through the rose-branches, but the girl had strangely attracted me as I have said before, and I wished to see if daylight confirmed my first impressions. Even while I was making up my mind on the subject, Mr Forbes entered the room, and Hester met him with a 'good-morning' kiss. I walked into the room then.

'Ah! Mr Alec, you are an early riser, I see. I wish I could say as much for the rest of my household; they are still finishing their morning naps, I daresay. You know Hester already, don't you?'

'I have not been introduced, though I saw Miss Carew at the dinner-table last evening,' said I, bowing.

'Now, Hester, pour out the coffee.—You'll take breakfast with us, won't you, Mr Alec? I suppose you will give yourself a holiday this week, and look about the town a bit before you settle down to work?'

'O no; I wish to put on harness at once. I long to take up the pen and handle the ledger,' I said laughingly.

'I daresay work will have charms for you at first, as any other novelty would; but you'll soon tire of it, my dear sir—tire of it, mind and body.'

Mr Forbes sipped his coffee with a sigh, as though he meant what he said; and I have since found out he had good reason for the assertion as far as *he* was concerned.

I would fain linger on the recollections of that pleasant meal. Hester handled the breakfast things with a grace peculiar to herself, and handed me my cup with such a pleasant smile, that I turned to her again and again for a fresh supply. She did not smile often; her face in repose was rather a sad one, with a kept-down, thoughtful expression, a patient look, as though the full brightness of her nature was held in check. Nor did she talk much. From the very first she was a little timid, a little shy, but her words came out pleasantly and wisely, gaining infinite expression from the sympathising glance of her eyes and the magic tones of her voice. All was in harmony; when she spoke, her whole nature seemed to respond to her words; they were not mere empty, rapid forms of speech with her. The simplest thing she did seemed gilded by the glamour of boyish romance. Mr Forbes talked a good deal at breakfast. He had many memories of my Uncle Hans to recount that I would much sooner he had kept to himself, and he finished up by saying, as he rose from the table: 'A tall, handsome man Sir Hans was, and no mistake. A man who cared for nothing, and stopped at nothing: it was all spend, spend, scatter, scatter with him. Mr Alec, you don't resemble him a bit.'

'No; and I am thankful for it. Where he spent, I hope to save, and where he scattered, I hope to gather together again. I will never rest till our glorious Lochview is free from the hideous load of debts he heaped up over it. I mean to be a great business man some day.'

'Sir Hans would have scouted the very idea of business, Mr Alec.'

'But I, his descendant, don't follow his example. I hope to win my way into the very heart of the world's traffic.—Won't you wish me success, Miss Carew?'

'O yes; I wish you success, indeed I do; and I think you will win it.'

'Thank you for that encouragement. I shall begin with fresh hope now,' replied I, returning her smile, and trying hard for one more glance of her eyes, which I did not get.

Mr Forbes was prolix enough as we walked along the streets, and I listened with patience while he unfolded various anecdotes of my venerable ancestors—still not much to their credit; but all the while I was longing to ask some questions about Hester Carew.

At the first pause I ventured: 'Is Miss Carew a relative of yours?'

'Well, yes, a distant one. Poor child! hers is a sad history.'

'Sad? She looks very young to know much sadness.'

'She was cradled in sadness, Mr Alec. Her father, Captain Carew, was a cousin of mine; he was sent out to India just after his marriage, and died there of sun-stroke. He never set eyes on poor Hester.'

'Is her mother living?'

'No; poor Fanny died ten years ago, just after I married Mrs Merritt, and Hester has lived with us ever since.'

'That must be very pleasant for her.'

'I don't know about that. Mrs Forbes and Hester don't seem to get on well together, and the girls are a bit jealous. I'm afraid they're rather hard on Hester sometimes; but there, I've stood out to it from the first, that while I have a roof over my head, poor Tom Carew's daughter shall be welcome to share it.'

I looked round at Mr Forbes with more respect, and with a greater regard than I ever expected to feel for him. He went on musingly:

'Her mother, poor Fanny Stewart, was once quite a belle among the county folk—she used even to visit at Lochview sometimes—so it was a great surprise when she married Tom, who had nothing but a handsome face and a good heart to recommend him. Her friends gave her the cold-shoulder in consequence; and when her father died, her name was never mentioned in his will.—But stop; I want to call at this bank: will you come in, or wait for a minute outside?'

I waited for many minutes outside the bank; and when Sandy Forbes came out again, I saw he was rather more flushed in the face, and rather more depressed in his spirits, than when he went in.

I was soon installed in the office, and placed in rather a responsible position at once—somewhat to the envy of several of the clerks; but they had their revenge by seeing how little I knew about my duties. I had grand though hazy theories of business in my mind, and ambitious plans and purposes enough for any one; but with regard to the detail, or the practical working, I was utterly at fault. However, I gave myself no airs, but set myself humbly to learn all I could; and with timely help, had already begun to master some of my duties,

when Dick Merritt lounged in. He was foppishly dressed still; his face was haggard, his eyes blood-shot, and there was an air of out-of-sortishness about him that did not add to his attractiveness.

'I'm rather done up to-day, for I never got to bed till three o'clock this morning,' drawled he.

'What kept you up so late? I'm sure everybody went away before eleven,' said I.

'I went to a supper-party after that. We had some capital play too, and I lost no end of money. Wouldn't the gov'nor open his eyes if he knew how much! Ah, well; I'll have my revenge to-night, I hope, and win it all back again. I say, Allen, some of the fellows were angry with me because I didn't ask you to join us—will you come to-night?'

'Thank you; I'd much rather not.'

'You'd better: there'll be some fun, a jolly good supper, and lots of play'—

'I detest suppers, and I detest gambling still more. Now, Merritt, if these are your kind of invitations, I shan't be in the least offended if you leave me altogether out of them in future—I shall always refuse them.'

'Everybody to his taste, I say; but what's the good of life if one doesn't enjoy it?' sneered Dick, with a kind of contemptuous laugh, as he drew off his delicate lavender gloves.

He thought me very narrow-minded, strait-laced, and prejudiced, I daresay, but I didn't much care for his opinion.

My time soon became fully occupied, for I spent all the day at the office, and in the evenings Alice Merritt was good enough to cater for my amusement. Once we went to a stylish dinner at the Cornishes, a costly set-out indeed, that, in its piled-up profusion and gaudy display, would have made our sleek footmen at Lochview turn up their noses, and pronounce the affair 'overdone,' 'plebeian,' 'bourgeois.'

Alice, in a rich apple-green dress and lace flounces, sat beside me at the table, devoting herself to my especial entertainment, and keeping up a strain of lively badinage which must have impressed the company with the idea that we were very good friends indeed. Again, we went to a Philharmonic concert. But ere long I discovered the custom of the house was, in all these amusements, decidedly to ignore the very existence of Hester Carew. Now and then she came into the drawing-room in the evenings, when Miss Merritt was thundering out some brilliant piece on the piano, all execution and sound, but with no more real feeling in her touch than an automaton would have had; or Hester would walk quietly in and seat herself away in some far-off nook, while Carrie was gushing out some of her sentimental songs. But I seldom had the chance of speaking to her; some impediment was sure to come in the way. Though no look or word of hers was unobserved by me, I did not venture to make either her or myself conspicuous. The only times when my restraint nearly exploded were when Dick Merritt would flutter round the pensive little figure, and overwhelm her with attentions, evidently unwelcome. Then I had more than once felt inclined to thrust him out of the room, as he deserved.

As time passed on, my grand theories about business were gradually fading away. No man could work harder at figures and accounts than I

did, but they seemed to lead up to no result. I knew there were mysteries and speculations, and bargainings and calculations going on, of which I was kept in complete darkness; else why all those secret conferences in Sandy Forbes's private room? Who were these men with whom he seemed to hold such deep consultations? Were they 'bears,' or 'bulls,' or 'stags,' or whatever other name they go by? I wanted to understand all the transactions by which the House of Forbes courted Fortune's smiles. I was not contented with the harmonious working of the machine and its sum-total, but I wanted to dive down to the deeper mysteries, to see the wheels and screws, the axles and cranks, the bolts and nails. Understand me fairly. I only sought to know what I then believed to be legitimate. I would have scorned to soil my fingers in any concern that had not strict moral integrity for its basis, or that was not perfectly straightforward and in good faith. When I pressed Mr Forbes to give me a clearer insight into the matter, he would draw into his shell like a timid snail, and grow inscrutable and dark like the oracles of old: the more I pleaded with him, the more reticent he became.

'Keep you on the safe side, Mr Alec, and don't dive too deep. Not one of your race was ever good at bargains; and many a man with as good intentions as you have has been drawn into a vortex that has swallowed up all his gains and his character to boot. Keep you clear of speculations, as you value your peace of mind.' And then Sandy would hurry off to the Exchange, leaving me to my own meditations in the office.

I soon found out Mr Forbes was not a happy man. At home, he was a mere cipher, for his ambitious wife—his late employer's widow—hardly took the trouble to conceal her contempt for the little man. She snubbed him on every possible occasion, and her daughters caught the tone from their mother, and snubbed him also.

Mrs Cornish had taken a seaside house somewhere beyond New Brighton, and one day she invited us all to join a garden-party down there. I made sundry excuses at breakfast, for I did not wish to give up a whole day to pleasure—such indulgence formed no part of my code—but Miss Merritt took me in hand.

'Do come, Mr Allen; the party won't be complete without you, and every one will be so disappointed.'

'I have some writing I must finish,' urged I.

'Pray, don't let that keep you at home, Mr Alec; I'll see to that, and some of the correspondence can stand over,' said Mr Forbes. So at last I made a compromise, and promised to join the party in the afternoon.

Just at the last minute, when I was on the point of starting from the office to keep my engagement, I remembered I had left a letter for my father locked up in my desk at home; so I made a detour round by the old square to fetch it. The streets looked half asleep in that blazing August afternoon; people had their blinds drawn down to keep out the glare; and I began to think an hour or two with the cool sea-breeze would not be such an unpleasant change after all.

'Everybody must be gone—even Hester Carew,' thought I, as I made a dart up-stairs in the quiet house. But no; a soft prelude on the piano

made me pause at the drawing-room door, and presently a full rich voice burst out with its youthful freshness:

Wake, North wind, waken from thy sleep,
And now, with dark sails all outspread,
Along the twilight sea we'll sweep,
To regions lonely as the dead—

It was the song I heard Carrie Merritt sing the first evening I spent in Liverpool, and I listened till the very last note died away like a breath; then I opened the door, and found, as I expected, the voice was Hester's.

She gave a little start, rose from the piano, and began gathering up the music.

'Do sing that again, Miss Carew.'

'I will, if you wish,' replied she, seating herself shyly at the piano. As she went on, she regained her self-possession, and I listened wondering and charmed. Never had I heard such singing before.

'Thank you very much. What a lovely voice you have. Why do you hide it, Miss Carew? You ought to sing for us sometimes in the evenings,' exclaimed I, hardly able to conceal my intense satisfaction.

'No one ever asks me to sing in the evenings, and besides, I should hardly have courage to do so, for I've never learned singing.'

'Then how do you manage to get on so well?'

'I've taught myself; and I don't think Carrie would call it "well" if she heard me stumbling over her songs,' she replied quickly.

'Carrie ought to give you some lessons.'

Hester shook her head.

'Carrie wouldn't have time; indeed, I don't think she would much like my even meddling with her songs. But it's a great treat to get everybody away, and then give myself lessons. I'm glad you don't think I get on so badly.'

'Badly! You get on beautifully. I never thought that song could be so pretty. Will you try another?'

The sweet girl did not argue the point—a kind of timidity prevented her doing so—and she went through song after song as I laid them before her on the piano, her tones gaining in expression, her voice in courage, as she went on. I turned over the leaves for her, and when a passage was not quite perfect, she went over it again, and we sang the words together. How well I remember that afternoon! The sunlight came slanting through the trees, and fell on her as she sat there, and the golden and crimson clouds of sunset appeared in the western sky, and were reflected on the mirror opposite the piano while I still stood there, bound by the spell of Hester's voice. As for Mrs Cornish's garden-party, the very recollection of it had vanished; and I might have stood there for hours longer, had not most uncongenial sounds recalled me to my senses. I heard Dick Merritt rushing up the stairs, three or four steps at a time; he threw open the drawing-room door with a puzzled and comical look in his eyes.

'Upon my word—duets going on! Is this the way you usually spend your time in our absence, Mr Allen? I really admire your taste very much.—Go on, Hester; sing for me now.' But Miss Carew had already gathered up the music, and was putting it aside. 'Won't you give me one verse?' exclaimed he petulantly.

'I'm very tired now, and you must excuse me,

she said, slipping out of the room as quickly as possible.

'It's a pity I disturbed you and Hester. Shall I go back and tell them at New Brighton you were spell-bound here by a siren, and could not get away?'

'Tell them what you choose. I suppose the party is nearly over now?'

'Not at all; they're going to have a hop in the evening. Alice made me drive back in the dog-cart to hunt you up. She said she was sure something dreadful had happened to you, as you didn't keep your word.'

Dick's sneer was hard to bear, but I controlled myself.

'I'm ready now, Merritt. Where's your dog-cart?'

'Come along, then; we shall just catch the steamer. The trap's on the Birkenhead side.'

I am bound to say Dick Merritt was a very surly companion as we drove along that evening. He watched me narrowly, with a keen distrust in his glance, and more than once seemed inclined to quarrel. Evidently he fancied my being with Hester was a planned and concerted affair between us, and he was jealous. Mrs Cornish's country place was called Rocky Mount. When we arrived, outdoor sports were over, and the guests were trooping in to tea. Only a few were still lingering out of doors in the soft moonlight, and amongst them were Alice Merritt and two or three other girls.

'Go and fetch them in, Mr Allen. You'll be sure to find them soon; for our whole place—gardens, grounds, and walks—do not cover an acre of land,' cried Mrs Cornish.

Nothing loath to get a ramble in the cool fresh air, I darted off, and soon found myself on the top of a sloping mound, on which some ambitious person had erected a small tower and planted a flag-staff. From this was a capital view of the sea, which the full moon had silvered and flooded with her silver light. The soft breeze came in over the waters laden with freshness, and I flung myself down on the soft turf beside the flag-staff, and watched the scene with a quiet happiness altogether new to me. Need I say I had forgotten my mission out there, and had begun to dream sweet, foolish, waking dreams about Hester. What they were, I need not recount; most people have had such dreams some time in their lives. Ere long, I heard voices on the other side of the tower, and some words fell distinctly on my ear. My name was mentioned, and Alice Merritt was the one who spoke.

'No, no; I am not yet engaged to Alec Allen, but we quite understand each other.'

'His father is a baronet, isn't he?' said another voice.

'O yes; Alec will have the title some day, for he is the son and heir.'

'So you will be Lady Allen. Oh, Alice, won't that be nice? How I envy you!'

I daresay I ought to have warned the young ladies to defer their confidences, as I was within hearing; but I was spell-bound at being disposed of so summarily, and with a muttered, 'Will she be Lady Allen?—Not if I know it,' I heard the next question:

'Is Alec handsome? You know I haven't seen him yet. Carrie says he's quite the reverse.'

'Carrie's a goose. I like his style of face—it's refined and classical; and he's quite a gentleman.' 'Is he clever?'

'Well, I never noticed any deficiency, but Dick says he isn't; and he can gauge mental calibre better than I can.'

(I muttered something else just then, not complimentary to Dick.)

'But what about Willy Dykes, Alice? Poor fellow! he won't like to be jilted?' asked the voice.

'I must break it to him by degrees. He won't be back from New York for six months yet, so there will be plenty of time.'

'I don't think you'll ever love Alec as you did poor Willy.'

'Perhaps not, if it comes to that. But, there, my days of romance are over, and I can't wait for ever for Willy; I must take a good chance when I get it.'

There was a pause for a moment or two, and then Alice said in a subdued voice, and with a little sigh: 'Come, Maud, let's go in. I feel so cold and shivery, you can't think; just as if some one was standing on my grave.'

'Thinking of poor Willy perhaps?' suggested her friend.

Then the voices grew fainter and fainter, as the girls went slowly down the winding path from the tower. I did not follow them; but pondered on what I had heard. So Alice had willed to be my wife, had she? Old Janet's warnings were turning out a true prophecy after all, and Miss Merritt was going to marry me for the sake of the title that might be mine some day! My eyes were open at last, and I became painfully conscious that all along I had been giving Alice some ground for her expectations. I shuddered to remember that many a one might have been misled by the tacit acquiescence I had given to all her plans for me. Often and often her name had been coupled with mine, and I never cared. At concerts, and dinners, and parties, we had always been set down together, and people had looked on smilingly, thinking, no doubt, our engagement was a settled thing. My cheeks flushed with indignation as I thought of it all. Alice had wound her web so skilfully, that the unthinking fly was nearly entangled. Perhaps, had I been thinking less of Hester Carew, I might have been more alive to the danger. I pictured Janet shaking her wise head at me, and exclaiming: 'Ye would not heed me, Maister Alec, but I told ye these misses, with their fine ways, and their feathers and gewgaws, would be wanting ye for your title. Ah! ye know but little of the wicked world.' Then I thought of Jessie Duncan. How her merry blue eyes would sparkle, as, with one of her silvery peals of laughter, she would torment and tease me in her mocking way: 'Poor Cousin Alec! I always told you, you never could be trusted all alone, to take care of yourself.' After long ruminations, I decided the wisest plan was to back out of my dilemma as speedily as possible, and, as a first step, I made myself anything but congenial that evening. Mrs Cornish came to meet me as I went in.

'Here's Mr Allen at last! We are waiting for you to get up a set of Lancers; and Alice wants you to sing a duet with her.'

But I would neither sing nor dance—I am ashamed to say how disagreeable I was—I plunged

myself at once into the midst of a conversation Mr Cornish and Sandy were holding together—a long dreary conversation, that made me for the first time understand how thoroughly heavy and dull the interchange of words can be made. How wonderfully people are gifted with the power of boring one another! I stood it all patiently, knowing I deserved such a Nemesis, and felt truly relieved, when, in a most subdued state of mind, I took my seat beside Sandy in the dogcart, and drove homeward in the bright moonlight. Dick did not come with us; and I think I heard his footstep on the stairs about three o'clock in the morning, as he crept cautiously up to his room.

THE RUDE STONE MONUMENTS OF BRITTANY.

By far the larger number of tourists who visit Brittany are attracted to it by its widely famed rude stone structures. It is obvious, however, that the traveller who visits the country for the first time may miss the best examples, unless he has some previous knowledge of what is most worth seeing, and that without some plan of systematic observation he may fail to notice the special features which impart an interest and value to the personal inspection of these ancient monuments. It is therefore of some importance for the intending tourist to know that with the lately published *Guide to Barrows and other Prehistoric Monuments in Brittany*, by Mr W. C. Lukis, for his pocket-companion, to point out to him the readiest mode of access to the localities where good examples of typical monuments occur, he may now familiarise his mind and eye with the archaeological characteristics of the prehistoric remains of Brittany, on the easiest terms.

There is no reason, however, for going out of the beaten track to look at a stone monument, unless with the view of becoming acquainted with its aspect as a work of human art. The only interest it can have for us is that it was made by men who lived very long ago. Contemplating the number and magnitude of the prehistoric remains with which the face of the country is everywhere studded, the conviction grows upon the mind that they were the work of a large and settled population, in permanent possession of the soil—a race actuated by deep feelings of respect and reverence for the memory of the dead, and possessed of a social organisation which enabled them to express these feelings in massive and enduring monuments.

The groups of lines or avenues of pillar-stones so frequently met with in Brittany are among the most stupendous and inexplicable monuments of the unrecorded ages. It seems as if in this circumscribed area we had the concentrated expression of a Titanic energy and intensity of purpose, unparalleled in the history of the early races. They consist usually of a definite number of lines or avenues, marked by huge unshapen blocks set on end at irregular distances. The lines thus formed are roughly parallel, but they converge slightly towards one end, and they also exhibit a gradation in the size of the stones, which are higher towards the wider end of the group. As a rule, the wider ends of the groups are placed towards the west, and in several instances there is at this end a terminating circle

of smaller, thinner slabs than those composing the lines. The Erleven group, of tall, bulky, granite blocks arranged in ten lines, is about seven thousand feet in length, 220 feet in width at the west end, and 190 feet at the east end. The Kermario group, consisting of about one thousand stones arranged in ten lines, extends 1250 yards in length, its breadth at the west end being 323 feet, and at the east end 180 feet. The Menec group consists of eleven lines with a terminating circle. It extends to upwards of eleven hundred yards in length, the terminating circle being about three hundred feet in diameter. The Kerlesant group consists of thirteen lines, about one thousand feet in length. The largest stones in the Kermario group are about twenty feet high, twelve feet broad, and six or eight feet thick.

These monuments are so mysterious and impressive by their vast proportions, and so deficient in their indications of intention or destination, that archaeologists have been puzzled to assign to them any definite or probable purpose, utilitarian or monumental. The middle age notion was that they were the tombstones of the eleven thousand virgins. The most recent theory is that they are military monuments—representations of troops in battle-array. But the fact that they are constructed on a plan which is nearly uniform, with a direction or orientation which corresponds in some measure with that of 'dolmens' or chambered tombs, appears to indicate a purpose more analogous to sepulchral than to military monuments. Plans of the principal groups, drawn to scale by Sir Henry Dryden, have been published in the Proceedings of the Ethnological Society, of 10th January 1871. On referring to these, the reader who wishes to satisfy himself on this subject will see at a glance the relative magnitude and orientation of the several groups, as well as their general uniformity of design. It is not generally known that we have in Scotland a corresponding class of monuments, though on a very much smaller scale, which are also associated with structures purely sepulchral.

Isolated circles of pillar-stones are not common in Brittany, and where they do exist they are much destroyed. Mr Lukis describes a curious double circle on the isle of El Lanic, which has been encroached on by the sea. When the tide is low, the prostrate stones of a great part of one of the circles may be seen on the beach, as well as a fallen stone still farther from the shore. In one of these circles, explored by Dr De Cloinadeuc, a large number of flint and other stone implements were found, consisting of polished axes of fibrolite, knives and scrapers of flint, hammer-stones, &c., along with large quantities of animal bones, and innumerable fragments of broken pottery. This is precisely the kind of deposit which might be looked for if the circle had been a place of interment of the later period of the Stone Age. In Britain, where the results of systematic explorations are more carefully recorded than has been the case in Brittany, the Stone Circles have been found in most cases to be places of interment of the same relative period, or of the succeeding period of the Bronze Age. In Northern Scandinavia again, though they are popularly known as *Dom-rings* or *Thing-places*, Nicolaysen states that archaeologically they are known as

burial-places of the Iron Age. This seems to indicate that the custom of constructing stone-circles appeared earlier in Brittany than in North Britain, and earlier there than in Northern Scandinavia, if we are warranted in assuming that the Iron Age of Scandinavia was later than the Bronze Age of North Britain, and this later than the closing period of the Stone Age in Northern France. It may be well to state, however, that these are all 'open questions,' to which definite answers are only to be obtained by the accumulation of evidence bearing on the comparative advancement of the populations of these countries at similar epochs. This indeed, is one of the most difficult and complicated problems of archaeology, only capable of being worked out by extending the field of observation and induction, and in effect creating a new branch of the science, embracing all the details of comparative archaeology.

The third class of monument mentioned by Mr Lukis, consisting of groups of pillar-stones arranged in a square or rectangular form, is almost exclusively confined to Brittany, and little or nothing is known with certainty of its original design.

The fourth class, of single pillar-stones (menhirs), is numerous and well known. In Brittany, however, these menhirs are often remarkable for their enormous size. The largest, at Locmariaker, now prostrate and broken, is upwards of sixty-seven feet in length. There is not a great difference between this prehistoric menhir and the most celebrated monoliths of the historic period. The shaft of Pompey's Pillar, and the standing obelisk of Thothmes III., known as Cleopatra's Needle, are not more than half-a-dozen feet longer. Single pillar-stones are probably, in most cases, sepulchral monuments. Jacob set up a pillar-stone as a memorial over Rachel's grave, 'which is the pillar of Rachel's grave unto this day.' They are common in Britain, and still more common in Scandinavia, where they are monuments of the later Iron Age.

The fifth class, termed *dolmens* in France, are better known in this country as 'chambered cairns'—huge mounds of earth or stones covering a chamber or chambers of sepulture, constructed of great blocks of stone. These are more numerous in Brittany than any other class of prehistoric structures.

As the application of different terms—*dolmen*, *cromlech*, and *chambered cairn*—to the same class of monument, naturally leads to confusion, it may be well to explain how this confusion is to be avoided. Mr Lukis holds very decided views on a question which has given rise to some difference of opinion in regard to the classification of prehistoric sepulchral structures. The term '*cromlech*' has been applied in this country to a structure consisting of an immense block of stone supported on three or more long stones set underneath it. Mr Lukis holds that there is no sufficient ground for regarding this as a distinct species of monument. When the covering mass of stones and earth has been removed by the improving agriculturist, the great blocks which form the monolithic skeleton of the mound and its chamber usually defy the resources at his command. As the skeleton implies the previous existence of the organised body of which it formed the framework, so, upon this theory, the existence of a '*cromlech*' implies the previous existence of the chambered tumulus of which it had formed

the internal framework. In our own country, Kite Coty House is an example of what is now considered to have been a chambered tumulus. The skeleton alone remains.

Sepulchral tumuli were formerly classified according to their external configuration or internal construction; but more extended and critical observation has shewn that mere variations of form afford no clue to the relative antiquity of the structures. But as it has always been the custom of the prehistoric races to bury with their dead objects in common use at the time of the interment, such as implements, weapons, and personal ornaments, we have in these the means of assigning the period of the deposit relatively to the Stone, Bronze, or Iron Age. Thus, when the great tumulus of Mane-Lud (two hundred and sixty feet in length, and one hundred and sixty feet in width) was explored in 1864 by the members of the Société Polymathique du Morbihan, a small sepulchral chamber was found in the centre of the mound, containing the bones of two individuals, one burnt, the other unburnt. Along with these burials there had been deposited an axe of polished fibrolite (a whitish mineral streaked with various colours), flint flakes, and fragments of coarse pottery. This deposit therefore belonged to the Stone Age, but to the latter part of it, when finely polished axes of these hard and rare stones were common, and burning the dead was in use, together with burial unburnt. This chamber was composed of dry masonry, and roofed by a rudely constructed vaulting, formed by bringing each successive stone a little further over the inner face of the wall than the stone immediately below it. The vaulted roof, formed of overlapping stones, is also a feature of the tumuli of Britain, but it is unknown in Scandinavia, where the chambers are always roofed by immense flat slabs.

Sometimes no traces whatever of human remains are found in the chamber. This was the case in the tumulus of Mane-cr-Hroek, in the earthen floor of which no fewer than one hundred and four axes of polished diorite were found, the largest of which was eighteen and a quarter inches in length. Besides these, there were an oval ring of jadeite stones three and a quarter inches diameter, nine large pendants of green turquoise, a necklace of forty-one beads of the same stone, a few fragments of pottery, and some flint flakes. As there is nothing so indestructible as burnt bone, the supposition is that the interments here had been unburnt, and had so completely decayed as to leave no noticeable traces of their former presence.

One of the most remarkable tumuli in Brittany is St Michael's Mount, now crowned by a church forming a conspicuous feature in the landscape around Carnac. It was explored in 1864, and found to cover a chamber of an irregularly four-sided figure, about six feet long by four and a half feet wide. The east end of the chamber which had formed the entrance was closed by two slabs. The other three sides were built of dry walling, and the roof covered by one large slab, which had been split throughout its length by the pressure of the superincumbent mound. The floor of the chamber was covered to the depth of some inches with a bed of dry soft dust, described as being like wheaten flour in fineness, though not in colour. This impalpable dust may have been in part due to the cremation of the bodies; but as the

mound was largely composed of sand, the infiltration of the finer particles in the course of ages had probably much to do with its production. The sharp edges of two stone celts were noticed sticking up through this layer of dust, and on a complete search being made, thirty-nine celts of jade, tremolite, and other hard stone, varying in size from fifteen inches to two inches and a half in length, were found. One had been broken into three parts, two of which lay at one extremity of the chamber, and the third at the other. Nine pendants and one hundred and one small beads, mostly of jasper, were also found; and under a small flat stone in the north-west corner, a necklace of 'bugles' or cylindrical beads of ivory. All the celts were set with their small ends downwards, and were grouped more thickly towards the western end of the chamber, leaving an open space in the centre. Underneath the bed of dust was an irregular pavement, beneath which there were ashes, charcoal, and burnt bones; while a small recess on one side of the chamber contained a mass of cinders, earth, and fragments of human bones. On the east side of this tumulus at its base lie two broken pillar-stones, one thirty-one feet, and the other twenty-five feet long.

The most imposing monument of this description in Brittany is the Butte de Tumiac, near Arzon. It is a mound nearly three hundred feet in diameter at the base, and fifty feet high. When explored in 1853, it was found to cover a small chamber not more than eight feet square, roofed by a single slab, which had been split by the pressure of the superincumbent mass. In it were found unburnt fragments of wood, thirty polished axes of fibrolite and jadeite, and three necklaces of beads made of green turquoise.

One of the most remarkable features of these chambered cairns is the occurrence on the great stones of rude sculpturings of wavy, curved, or zigzag lines and spirals, sometimes arranged as patterns, and covering almost the whole surface of the stones, as in the chamber of Gavrilis; at other times irregularly grouped, as at Mane Lud. Occasionally these designs are varied by rude representations of axe-heads, and axes in handles decorated with plume-like ornaments, as at Mane-hrook. The chambers of the great tumulus of New Grange, and of the great cemetery of Cairns at Lough Crew in Ireland, are covered with somewhat similar sculpturings. Axe-like markings have also been found on the stones of a chambered tumulus in Argyllshire. Such sculpturings on the stones of chambered tumuli do not occur in England, but they are found in Scotland and in Scandinavia, along with a peculiar development of this custom of sculpturing on exposed rock-faces and boulders. The objects represented in the Scandinavian rock-sculptures are mostly galleys with their rowers, sometimes a man and oxen ploughing; wheeled vehicles, swords, animals, and human figures are also rudely represented.

There is another class of sculpturings known to the archaeologists as 'cups' or 'cups and circles,' first made generally known in Scotland by the exhaustive treatise of the late Sir James Y. Simpson. These 'cups' are common on the stones of the Brittany monuments, usually as simple rounded hollows, often occurring in groups, of irregular arrangement, but sometimes so grouped as to suggest a resemblance to some of the con-

stellations. Nothing is definitely known of their meaning or object. In Scandinavia, where they are very common, they are still associated with superstitious notions among the people.

FALLEN FORTUNES.

CHAPTER XL.—MR HOLT'S ADVICE.

WHEN we lose one very dear to us, by death, the agony culminates at once; there is nothing more dreadful to be felt than it; it will break out again and again with intense severity, but always with a less violence than in the black hour of bereavement, and a day comes, sooner or later, when our friends—the best of whom do not know us half so well as we know ourselves—remark to one another: 'He has got over it.' The effect of a great stroke of ill-luck—of a very heavy pecuniary misfortune, for example—is generally quite different. The blow prostrates us for the moment, but almost directly afterwards vitality asserts itself; we are revived by a host of hopes, each insignificant in itself, and which, since they cannot coalesce, have really no practical value; but they inspire courage. A drowning man is said to catch at a straw, and ten thousand straws floating about him would doubtless proportionably excite his hope, though they would be of no more help than one, unless they could be formed into a straw rick. And thus it was with John Dalton, when he woke—for 'merciful nature' had given him nearly an hour's forgetfulness—to find himself, for the first time, a ruined man. We say 'for the first time,' because many respectable persons are ruined many times, and to them the picture I have painted of this man's wretchedness will doubtless have appeared too highly coloured. Nay, they will assert, 'Not even at first did we give way in such a miserable manner.' Very likely, my friends. Are you quite sure that you really lost anything? Had you anything of your own to begin with? And did you not go into that particular line of business which proved so unfortunate, with this catastrophe already more or less before your eyes? Now, John Dalton could scarcely have been more astonished at what had befallen him had he suddenly found himself changed into a bird or a beast.

He had left his own line in life, and entered into 'commercial enterprise,' it is true, with no higher aim than his own butler, who would doubtless now take a public-house with the money saved in his own service, namely, 'to better himself;' but he had had no idea of risking his all upon the result; and the shock—now he found that he had lost his all—was by consequence the greater. Still, as we have said, the clouds seemed to lift a little that morning; he was able to put in a cheerful appearance at the breakfast-table; nor throughout that day, except that he at times appeared preoccupied, could you have guessed the load of care he bore upon his shoulders. The *Pall Mall* confirmed the news of the previous morning, however: another commercial collapse, though, fortunately, it was

understood to affect only a limited circle, had taken place in the case of the *Lara* mine; it had been egregiously pulled, but had now gone the way of most mines; the expert sent out by the committee of English shareholders had 'cabled' news that the speculation was next door to worthless; that the proceeds of the mine would not even pay for its working. The shares, which, but the other day, had been at a high premium, were now unquotable. The fifteen thousand pounds which Dalton had invested in it, and which represented about half the value of the English shares, were irrevocably gone.

Convinced of this, he did not lose a post in privately communicating with such friends as he thought might have the power to serve him. He was frank with them, and yet concise: 'I have lost all my money, and urgently require some employment—the more lucrative the better,' was the burden of each note. After despatching them, he felt relieved, as a man will do who has done his best to help himself.

'From so large a principal of good-will,' thought he, 'I shall surely get a sufficient return of interest for my needs.' Nor did he in this calculation overestimate his popularity; almost everybody liked John Dalton, and would have done him a good turn if they could.

At dinner he was exceedingly amusing, and excited Mrs Campden's indignation by a spirited defence of the Indian system of suttee. The chief objection to death, in the case of comparatively young persons, he argued, was that no dear ones have preceded them into the dark and silent land; whereas the old may flatter themselves with the idea of rejoining their kinsfolk and acquaintances. Thus, although it might be a little selfish in His Highness, nothing was more natural than that an Indian prince, finding himself on the point of departure from this world, should require his favourite wives and servants to accompany him upon his journey to the other, where it was only too probable that he would not find persons to understand his little ways, and make him comfortable.

'I call it most abominably wicked,' said Mrs Campden.

'Doubtless it is, my dear madam; I only said it was natural, which, indeed, corroborates the view of the Church of England upon original sin.'

Mrs Campden did not quite understand this logic, but she had a strong suspicion that her guest was joking—a thing which in itself she detested—and, what was worse, that he was joking at her own expense. She shewed considerable annoyance; nor could Mrs Dalton avoid casting a reproachful glance at her husband. 'Is this a time,' it seemed to say, 'to give offence to friends, when it is so necessary to rally them round us?' But the fact was that it was the very consciousness of that necessity which tempted Dalton to shew his independence, by carrying to some extremity that guerrilla warfare which had always existed between his hostess and himself.

Mrs Campden had her revenge, if she had only known it; for she was very loquacious about certain plans for the future, in which Mrs Dalton and her daughters had their share, with respect to her next visit to London. Mary, as had been arranged, was to stay with the girls in Cardigan Place for some weeks, during which all sorts of

gaeties were to be enjoyed; and then Mr and Mrs Campden were themselves to come up to town, and exchange their present position as host and hostess for that of guests. In all these projects the wherewithal was, of course, taken for granted and as a matter of course; and it cut Dalton to the heart to hear the eagerness with which his daughters entered into them. In a few weeks' time, as he bitterly reflected, there would be no home, even for themselves, far less to offer to others.

His position during this unhappy day was, however, a less painful one than that of his wife; for she could not escape without attracting notice from the society of those dear ones whose unconscious gaiety inflicted upon her a thousand stabs, while her husband could seek solitude or the companionship of those comparatively indifferent to him, under pretence of transacting business. Indeed, he found some relief from his pressing anxieties in conversation with Holt himself, notwithstanding the unfavourable light in which he had begun to regard him. The man had a clear head for affairs, and was able to place his position and obligations before him with a greater definiteness than lay in his own power.

It is something to know where you are, however uncomfortable may be your predicament, and with this information Dalton was by this means supplied. If he was 'sold up to-morrow,' there would be three thousand pounds left for the support of his wife and family! a sum which had hitherto about represented his annual income.

'So you can live a whole year, my good fellow, as you have been accustomed to do,' said Holt cheerfully; 'and in the meantime it will be strange indeed if, with such influential friends as you possess, some post is not offered you.'

There were three things in this speech that annoyed Dalton excessively.

In the first place, he did not like the familiarity of it; the phrase 'my good fellow' had not often been in Holt's mouth, even if he had ever before used it; it seemed to him that the man was taking liberties with him because of his downfall. Secondly, he thought he detected a sneer in the tone in which his 'influential friends' were mentioned. It had been the object of Holt's ambition to be introduced to these friends, but their acquaintance could scarcely have been satisfactory to him, and it seemed probable that he meant to imply that they were broken reeds to lean upon, taking it for granted that they would be no more sympathetic with Dalton than they had been to himself. Thirdly, and most of all, he was irritated at the man's supposing he could be so unadvisedly selfish as to continue the same course of life, under his changed circumstances, as he had hitherto done. Nevertheless, he restrained his passion.

'You must take me for a very phlegmatic fellow, Holt—not to say a knave and a fool—to suppose I could enjoy such a year of prosperity as you suggest.'

'Indeed, I meant no offence. I have known many a man in a worse pickle than you go on precisely the same way as though he had not lost a shilling; and in the end, none but myself and one or two more ever knew that he had lost one. With a year to turn about in'—

'Don't talk such sheer nonsense!' interrupted Dalton impatiently. 'Such a phrase may mean something with your City friends, who have

always got some scheme or another of enriching themselves at the expense of the public; but as addressed to me, you must know it is mere moonshine.'

'Live on fifteen hundred, then, for double the time. Surely in two years'—

'No!' broke in the other. 'I am not likely to act a lie any more, I hope, than to tell one. I shall make no secret to any one, after I have left this house, of the ruin that has befallen me.'

'You will do as you please, Dalton, of course; but I see no reason why you should cry stinking fish. Nobody likes a man the better, or feels more inclined to help him, because he is poor; and then there is your family to be considered.'

'Sir!' cried Dalton sternly, 'I beg you will confine your observations to those affairs in which I have asked your advice. My wife and children will be guided by my own judgment in this matter, and by it alone.'

Mr Holt shrugged his shoulders, and threw his hands up (in the style that he believed to be continental) with an air so peculiarly vulgar, that it would have aroused Dalton's disgust under any circumstances; as it was, he felt his contempt for this man fast changing into a consuming hate. 'It is impossible to discuss this question, Dalton, if, in every suggestion of mine, you are determined to find some ground of quarrel. In my humble opinion, to inform the world of your ruin is to make that ruin certain. Men put water into a pump to make it draw; but if they know there is nothing in the well, they spare their labour. Except in the way of charity, no moneyed man will help you, if you begin by acknowledging yourself bankrupt.'

'And who told you, sir, that I was going to ask any man for his money?' The tone and manner of Dalton were so threatening, that Holt, who had recommenced his continental shrug, desisted from it half-way; his shoulders went up, but did not come down again, so that he remained like the famous jumping frog, who could not start by reason of the small-shot in his inside.

'I did not mean that you were going to beg, of course; but money or credit may certainly be very necessary for you, and that at once, supposing there is bad news from Brazil.'

'Bad news from Brazil! Do you mean as respects the *Lara*? Why, we have had such bad news already, that I don't see how it can be worse. I take it for granted that the shares must be paid up in full, and are worthless, and that all my fifteen thousand pounds are gone.'

'That is certain. But is it possible you have forgotten the fact that the liability is unlimited?'

The conversation we have been describing took place in the library at Riverside—a magnificent room, so contrived that to those within it there appeared no door at all, all the walls being lined from floor to ceiling with splendidly bound books. These gorgeous volumes, all gilt and colour, as well as the three large windows on which the afternoon sun was shining, now began to revolve before the unhappy Dalton's eyes; the world spun round with him, and that so fast, that it seemed he had no breath to reply to his companion's words.

'You *did* know that they were unlimited, of course?' continued the other after a long pause.

'I did; but you told me—you yourself—that they were only nominally so; that the operations

of the mine were on a comparatively small scale, and that we should never be required to pay up the shares in full, much less to become liable for more.'

'I daresay I did, my good fellow; but then I was deceived, like yourself. How could I know that the speculation would turn out to be so disastrous?'

'You mean that you did not know it was a swindle?'

'Well, a swindle is a harsh term.'

'It is the name, you have read, which the expert sent out by the committee has given to the whole concern: he says there is no gold worth speaking of, and that an attempt was made to "salt" the mine, in order to deceive him. In my opinion, to call men rogues, who are capable of such a plot as that, is to pay them a compliment. They are unmitigated cheats and scoundrels, who deserve to be laid by their heels in jail, and would be likely to contaminate those they found there.'

'My good friend, one must take matters as one finds them. If I could have foreseen that the promoters of the enterprise were such as you describe, you may be sure I should not have invested my own money in it, even for a day. It is no use crying over spilt milk; let us look at the matter like practical men. It is quite possible that the paid-up shares may cover all expenses; but, on the other hand, they may not; in which case it will be necessary that your friends should stand by you. I beg, my dear Dalton, that you will consider me as one of them, and certainly not the least interested in your welfare. I will myself be responsible for any liability you may incur in the *Lara*, over and above the amount of the shares. If you doubt the genuineness of my offer, let me put it on paper.'

'You are very good, I am sure,' returned Dalton, keeping his eyes fixed upon the carpet, and speaking as if every word was dragged from him by force. 'Your word is quite a sufficient guarantee of your wish to serve me.'

Whatever happened, he was resolutely determined that he would never lay himself under an obligation to this man.

'Good? Not at all, my dear fellow,' replied the other cheerfully; 'it is in such circumstances as the present that a friend should shew himself friendly. There is many a one who will lend you money, I don't doubt; but come to me first, I beg of you. As to security, be sure I shall never look for it; and as to interest, I hope I may be allowed to say, that another sort of interest, which I feel in the well-being of you and yours, will more than repay me for either risk or loss.'

'You are very good,' repeated Dalton mechanically.

It was not a hearty acknowledgment, far less an eager acceptance of his offer; but Holt seemed well content with it; perhaps he felt that it was something that he had been allowed to say 'you and yours' without awakening the passionate

* Unprincipled speculators who wish to make a worthless mine appear really a valuable one, sometimes surreptitiously sprinkle the ground with ore or precious stones brought from elsewhere. The unsuspecting public then rushes in and buys up the shares at greatly enhanced prices, on the faith of dazzling reports spread by the sprinklers. This process of strewing the mine with the tempting bait is called 'salting.'

resentment that he had aroused the previous night. If the gain was a small one, it had at least been made in a short time.

'We shall not know about this precious mine, I suppose, for certain, until next mail!' inquired Dalton after a pause.

'Nor even then, perhaps, as to the liability. They are sure of you, you see, confound them! or think themselves so; though, in such a case, considering how you have been imposed upon, there would be ample justification for your washing your hands of the whole matter. I know many a man that would do so, nor would the world blame him.'

'I don't understand you. How could I wash my hands of it?'

'Well, of course, it's a matter of feeling; I am not recommending you, mind, to take any steps of the kind; but it would only be acting in self-defence, if you were to say: "I have paid enough, and more than enough, for what was always worthless, and I will pay no more." You might realise what you could, and take yourself "out of the jurisdiction of the court," as the phrase is—to Sweden, for example.'

'What! and leave the rest of the shareholders to bear the brunt of it?'

'That, of course, sounds like injustice; but the question is, who *are* the other shareholders? There is not one of them who has lost fifteen thousand or five thousand, I will answer for it, beside yourself. Perhaps you are the only solvent man—I don't know, mind, but it is as likely as not—of the whole lot. If you were out of the way, it might not be worth their while to have a shot at anybody else.'

'Then you think I should abscond to Sweden with my wife and family?'

'I confess I think small blame would be imputed to you, if you withdrew yourself till matters were settled, either to that country or elsewhere; but as to your taking Mrs Dalton and the young ladies, that seems to me quite out of the question.'

'It is not more out of the question than that I should go myself, Holt,' answered Dalton coldly. 'Pray, understand that I am not yet a scoundrel, although I find myself connected with schemers, such as started the *Lara*; it will save you a great deal of pains in making any future suggestions, if you keep that in mind.' As he said this, Dalton rose from his chair, and pushing open the 'lummy' door, formed of the backs of books, walked out of the room, leaving his companion to his meditations.

Mr Richard Holt, however, was not a man to easily take offence (unless it was to his advantage—as it sometimes was—to do so); he doubtless made allowance for the soreness of one in whom the sense of ruin was so recent; and when he met his friend an hour or so afterwards in the drawing-room, it was with his usual air and manner. Dalton, on his part, also soon recovered himself; he could not but reflect that he had heard Holt give utterance to the like lax opinions and advice with respect to others, and had not rebuked him; so that it was not surprising he should have suggested such a course in his own case, without apprehension of giving offence. In spite of his dislike of the man, his company for the present was almost necessary to him; he was the only person—save his wife, who did not under-

stand them—to whom he would speak unreservedly respecting his affairs.

Holt might be useful to him yet; he had a keen practical mind, and if his advice had been at one time fatal to him, it could be no longer harmful, since he had nothing to lose. So much of assistance it seemed to him he had a right to claim. But as to accepting from him any such help as had been suggested, that was not to be thought of. He had never been indebted to him for any favour—his instincts had warned him against that from the first; and now least of all, in his wretchedness and ruin, did he feel inclined to accept assistance at his hands.

CANINE SAGACITY.

A CORRESPONDENT hands us the following anecdotes, illustrative of the remarkable reasoning powers of dogs.

The first case is one which occurred at a fashionable watering-place on the east coast of Ireland, some twenty years ago, and exhibits the remarkable sagacity displayed by a dog in carrying out the dictates of the animal passion for revenge. The jetty which stretched along the small harbour was at that time used as a promenade by the élite among the sojourners on the coast, where, after the heat of the long summer days, they regaled themselves with the fresh evening breezes wafted in from the sea. Among the frequenters of this fashionable resort was a gentleman of some position, who was the owner of a fine Newfoundland dog, which inherited the time-honoured possessions of that noble breed—very great power and facility in swimming; and at the period of the evening when the jetty was most crowded with promenaders, his master delighted to put this animal through a series of aquatic performances for the entertainment of the assembled spectators. Amusement being at a premium on the coast, these nightly performances grew into something like an 'institution,' and the brave 'Captain'—for such was his name—speedily became a universal favourite on the jetty. It happened, however, that among the new arrivals on the coast there came a certain major in Her Majesty's army, accompanied by two bull-dogs of unusual size and strength, and of very great value; but value in a bull-dog being inversely proportionate to its beauty, the appearance of the major and his dogs excited no very enthusiastic pleasure amongst the æsthetic strollers on the jetty. On the first night on which the major presented himself, nothing unusual occurred; and Captain dived and swam as before. But on the second evening, the brave old favourite was walking quietly behind his master down the jetty, when, as they were passing by the major and his dogs, one of these ugly brutes flew at Captain, and caught him by the neck in such a way as to render his great size utterly useless for his defence. A violent struggle ensued, but the bull-dog came off the victor, for he stuck to his foe like a leech, and could only be forced to release his hold by the insertion of a bar of iron between his teeth. The

indignation of the by-standers against the major was, of course, very great; and its fervour was not a little increased, when they saw the poor Captain wending his way homeward, bleeding, and bearing all the marks of defeat. Some two or three evenings after this occurrence, when Captain again made his appearance on the jetty, he looked quite crestfallen, bore his tail between his legs, and stuck closely to the heels of his master. That evening passed away quietly, and the next, and the next; and so on for about a week—Captain still bearing the aspect of mourning. But one evening about eight or ten days after the above encounter, as the major was marching in his usual pompous manner along the jetty accompanied by his dogs, something attracted his attention in the water, and walking to the very edge of the jetty, he stood for a moment looking down into the sea. Scarcely had the two bulldogs taken up their stand beside their master, when Captain seizing the opportunity for which he had so long looked, rushed at his former conqueror, and catching him by the back of the neck, jumped off the jetty with his foe in his mouth, down some twenty feet or more, into the sea. Once in the water, the power of his enemy was crippled, while Captain was altogether in his own element; and easily overcoming all efforts at resistance, he succeeded in resolutely keeping the bull-dog's head under water. The excitement on the shore was of course intense. The major shouted, and called out: 'My dog! my beautiful dog! Will no one save him?' But no one seemed at all inclined to interfere, or to risk their lives for the ugly dog. At length the major called out: 'I'll give fifty pounds to any one who will save my dog;' and soon afterwards a boat which lay at some little distance pulled up to the rescue. Even then, however, it was only by striking Captain on the head with the oars that he could be forced to release his victim, which was taken into the boat quite senseless from exhaustion and suffocation, and was with difficulty brought to itself again. Captain, on the other hand, swam in triumph to the shore, amid the plaudits of the spectators, who shared, in sympathy at least, his well-earned honours of revenge.

More remarkable than the sagacity in carrying out the desire for revenge displayed by the Newfoundland dog in the above case, is that which the following narrative illustrates. A gentleman of wealth and position in London had, some years ago, a country-house and farm about sixty miles from the metropolis. At this country residence he kept a number of dogs, and amongst them a very large mastiff and a Scotch terrier; and at the close of one of his summer residences in the country, he resolved to bring this terrier with him to London for the winter season. There being no railway to that particular part of the country, the dog travelled with the servants in a post-carriage, and on his arrival at the town-house was brought out to the stable, where a large Newfoundland dog was kept as a watch-dog. This latter individual looked with anything but pleasure on the arrival of the little intruder from the country; and consequently the Scotch terrier had not been very long in his new home when this canine master of the stable attacked him, and, in the language of human beings, gave him a sound thrashing. The little animal could, of course, never hope by himself to

chastise his host for this inhospitable welcome, but he determined that by some agency chastisement should come. Accordingly, he lay very quiet that night in a remote corner of the stable, but when morning had fully shone forth, he was nowhere to be found. Search was made for him, as the phrase says, high and low, but without success; and the conclusion reluctantly arrived at was, that he had been stolen. On the third morning after his disappearance, however, he again shewed himself in London, but this time not alone; for, to the amazement of every one, he entered the stable attended by the big mastiff from Kent. This great brute had no sooner arrived than he flew at the Newfoundland dog, who had so badly treated his little terrier friend, and a severe contest ensued, which the little terrier himself, seated at a short distance, viewed with the utmost dignity and satisfaction. The result of the battle was, that the mastiff came off the conqueror, and gave his opponent a tremendous beating. When he had quite satisfied himself as to the result, this great avenger from Kent scarcely waited to receive the recognition of his master, who had been sent for immediately on the dog's arrival, but at once marched out of the stable, to the door of which the little terrier accompanied him, and was seen no more. Some few days afterwards, however, the gentleman received a letter from his steward in the country informing him of the sudden appearance of the terrier there, and his as sudden disappearance along with the large mastiff; and stating that the latter had remained away three or four days, during which they had searched in vain for him, but had just then returned home again. It then, of course, became quite clear that the little dog, finding himself unable to punish the town bully, had thought of his 'big brother' in the country, had travelled over the sixty miles which separated them, in order to gain his assistance, and had recounted to him his grievance; it was plain also that the mastiff had consented to come and avenge his old friend, had travelled with him to London, and having fulfilled his promise, had returned home, leaving the little fellow free from annoyance for the future.

The following well-known story is a strong example of the great intelligence which may be developed in a dog by careful training. A fashionably dressed English gentleman was one day crossing one of the bridges over the Seine at Paris, when he felt something knock against his legs, and looking down, he found that a small poodle dog had rubbed against him, and covered his boots with mud. He was, of course, much annoyed, and execrated the little brute pretty freely; but when he got to the other side of the bridge, he had the boots cleaned at a stand for the purpose, and thought no more about the matter. Some days after this occurrence, however, he had occasion again to cross that bridge, and the same little incident occurred. Thinking this somewhat odd, he resolved to watch where the little dog went to; and leaning against the side of the bridge, he followed with his eye the movements of his dirty little friend. He saw him rub against the feet of one gentleman after another, till he had exhausted all the mud off his once white skin, then rush off down the bank of the river, and there roll himself in the mud collected at the side. Having thus got

a new supply of dirt, the little animal ran up to the bridge again, and proceeded to transfer it to the boots of the passers-by, as before. Having watched his movements for some time, the gentleman noticed that on one occasion, instead of running down to the river, he went off to the proprietor of the stand for cleaning boots, at the other end of the bridge, who received him very cordially. The truth then for the first time dawned on him, that the little animal belonged to the man who cleaned the boots, and was trained by him to perform these mischievous deeds, for the purpose of bringing in custom. Being very fond of dogs, the Englishman resolved to purchase this clever little fellow, and bring him back to England with him. When, however, he went to the dog's master, that person at first denied any connection with him, and only admitted the ownership when he was perfectly satisfied that his interrogator had no connection with the police. For some time also he refused to part with the little poodle, saying that no money could pay him for the loss of his dog, who really made his living for him. Tempted, however, by a very high price, he at last consented to sell the dog; and the gentleman, a few days afterwards, brought him over to England, travelling *via* Boulogne to Folkstone. His residence in England was some thirty or forty miles from Folkstone, and to this place he brought his little purchase. He had not been many days in his new home, however, when the little French poodle suddenly disappeared. Search was made for him everywhere, but to no effect. His new master offered a reward for him, but with the same result; and he had at last made up his mind that the little fellow had been either poisoned or stolen, when one morning, about six weeks after his mysterious disappearance, the gentleman received a letter from a friend in Paris telling him that his dog was back again there, and at his old trade of soiling boots in the interest of his former master. The little fellow not liking the dullness of a country life, had resolved to return to his former home, and had made his way to Folkstone; there, as the gentleman afterwards ascertained, he had got on board a steamer going to Boulogne, and from Boulogne had found his way back to Paris.

Of the foregoing three stories, the first two are probably even more remarkable than the last. The last (except as to the dog's finding its way back to Paris) illustrates only the possibility of developing in a dog, by the training of its natural intelligence, an almost human ingenuity. But it is by instilling into the dog the intelligence of a higher being that this skill is engendered. The spring of the intelligence is in the trainer, and it is to attain an object which the higher being, and not the lower, has in view. But in the first two cases, the whole process is the dog's: the object to be secured, namely, revenge, is what the dog himself seeks, and the means by which that object is to be attained are devised and carried out by the instinct of the dog. That a dog should harbour revenge is, of course, not a very wonderful fact; but there is a calm reflection and a cool calculation displayed in the first two cases above given, which make them somewhat peculiar. If what we call instinct in these animals embraces powers so very like reason; if they are swayed by the same passions and affections which move us, and they are able to communicate to their fellows the feelings which

stir them, and the external circumstances which bring those feelings into play, the border-line between man's mental territory and theirs becomes a little bit indefinite.

MEMORIES.

When the gray twilight softly spreads
Her robe o'er earth and sky;
When the far mountains' shaggy heads
Are lost to human eye;
When the tired bird at eve hath sought
Sleep in the tuneless bower;
When the last bee wings homeward, fraught
With forage from the flower;
When the dark pinewood dimly shows
Its deepening tints of green;
When in the west with crimson glows
The sunset's closing scene—
I watch the glimmering shadows kiss
The threshold of the night,
And o'er my heart a soothing bliss
Falls in the waning light;
And grosser thoughts that sternly cling
To Life's dull sober day,
Leave me, as swallows on the wing
Flit from our sight away.
And soft as ripple on the lake,
Within my bosom rise
Half-whispered yearnings, that awake
A thousand memories—
Sweet memories, that only come
To woo my waking dreams,
When twilight shrouds the woodlands dumb,
And slumbers on the streams—
Of faces that I loved of yore,
And songs the loved ones sang,
And children's voices—heard no more—
That through the greenwood rang.
O spirit treasures, ye are mine,
And to my heart belong,
Yet linger not till I repine,
Or sing a sadder song;
But leave me while I still have power
To catch the sunny glow
Wafted from Memory's blissful bower—
The shrine of Long Ago.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MS. should be written on one side of the leaf only.

5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

OUR FEATHERED NEIGHBOURS.

ROOKS.

THOUGH I was born and bred in the country, I passed a quarter of a century in an important provincial city, during which time I was pretty actively engaged in business. Throughout that term of years I constantly cherished the hope of being able to retire from the bustle of commerce, to spend the closing days of my life in a rural home of my own. This desire has also been gratified. My place is known as 'The Holly Bush,' though it was none of my naming; but that is nothing to the purpose. The house is very pleasant, being surrounded by a garden and orchard, with about twenty acres of good pasture-land. We have a couple of cows, a pony—or I should say a col—several pigs, and a well-stocked poultry-yard. It is quite necessary that I should enter into these matters at the outset, in order that the reader may understand that the particulars I am about to state concerning my neighbours are the result of observation, and not a mere compilation of other men's experience.

The neighbours concerning whom I am about to speak are the Rooks. Their colony, a very extensive one, is about a hundred yards from the gates of my dwelling, and, indeed, it forms the boundary of my property, though, to speak correctly, it stretches far beyond the limits of my modest domain. Having abundance of leisure, I amuse myself by watching their proceedings, and as my observations have been spread over three consecutive years, I believe I have gained some special knowledge of their habits and customs.

Our attention was first attracted to these birds on a bright sunny morning in the month of February, when they came by hundreds, and set up such an outbreak of 'caws,' that the most indifferent persons could not be unaware of their presence. The severe weather of winter had prevailed but a few days before, and I considered it was somewhat strange at the time that these birds could be looking for the spring season on so short a notice, so I watched their doings very

attentively. It certainly appeared to me, after a while, that there was much more noise than work amongst our neighbours. Indeed, I could not discover that they did any work at all. Each rook shouted as loud as it could, and every shout awoke a hundred reverberations. Sometimes a large number would simultaneously set out on the wing, and make a flight of considerable circuit, and then return, and set up as loud a cawing as ever. Though, of course, I knew that rooks are gregarious, I observed that there existed a statute of limitation amongst them. If some of the nests were built very near to each other, I saw, in other instances, that the sanctity of home was strictly guarded, and that only the proprietors themselves were allowed to come within what I judged to be a restricted number of feet. It struck me that all the hubbub that was made had reference to a settlement of old sites and new ones; some stood in their nests, and proclaimed as from so many rostrums, probably the continuous rights of property. It might be to save themselves the labour of building, that they pleaded the necessity of the first-comers being first served, though others who had no nests were equally uproarious. Be that as it may, such a maxim was not favoured by the republican law of rooks, for if ever a bold and rebellious young couple sought to take possession of a nest by force—it might be the one in which they themselves were reared, and therefore the property of their own parents—they were invariably overpowered by numbers, and ignominiously expelled. Neither are any of the community allowed to become separatists, for if, in a sulky mood, these youngsters shewed signs of such intention, punishment would follow. It may therefore be readily imagined that the building stances are regulated by fixed principles.

We all know that bright February days are generally followed by north-easterly blasts, of which there is an old adage that 'they are good for neither man nor beast,' and, most certainly, they are not calculated to excite any merriment in the rookery. The birds sit in silence on the branches, swayed by the force of the wind, and

have the appearance of being uncomfortable to the last degree. I have occasionally thought that they felt ashamed of being deceived by the treachery of the weather. In a few hours they look as if they had grown prematurely old, and could never again take any interest in sublunary affairs.

About the first of March, however, if the weather be dry, and the wind not too boisterous, the work of building begins in earnest. The older birds have only to effect a few repairs, but the young ones have to begin from the foundation. On the 6th of that month, I observed a couple just making a start, and though there was a great deal of noise, the tone and manner of the birds were different. They did not appear to be shouting one to another, as before, but seemed to caw for their own delectation and encouragement. At the end of the first day but little progress was made. No form of a nest was indicated by the few sticks that might have been carelessly thrown together. On the two following days the wind blew very hard, and all hands struck work. None was so adventurous as to attempt to carry on business. The day following, however, the storm subsided; and though the weather continued cold, the colony once more became the scene of noise and activity.

In the first stage of building, and even until the nest begins to assume a finished form, it is found necessary that one bird should remain on guard, whilst the other goes forth in search of building materials. From very careful watching I have come to the conclusion that this is not done alternately by the male and female birds. The former does the work, not only of bringing home the sticks, twigs, and other requisites, but also of arranging them in order; whilst the lady's duty is to take care of the property already acquired. Occasionally, as if to assert her independence and equality with her husband, she will take to flight, either for food or exercise, or perhaps in her anxiety to hasten the progress of the building. It is during her absence that most of the depredations are committed. Such pilferings are managed in the most stealthy manner possible; the thief, which is generally a near neighbour, pretends to be very busy, and when she imagines that no one is looking on, will nip up a twig and apply it, as well as any other portion of the unprotected property, to her own purposes. I have never seen a theft committed openly, probably from the fear of exciting popular indignation.

The breaking off of twigs and sticks from the branches of trees must be very hard work. A rook may be often seen tugging away for half an hour before its purpose can be accomplished. During the two days' storm to which I alluded just now, a great quantity of what might appear, at first sight, to be useful material, was strewn on the ground, but the rooks never attempted to make any use of it. Probably they knew by instinct that what they gathered, themselves, from

off the living trees was more sound and durable than such as was brought down by the wind. When carrying home the larger sticks, the birds often appear to be much exhausted with the labour, and in attempting to wend a somewhat intricate way amongst the branches, they not unfrequently lose their prize when within a few yards, or even feet, of their destination; still I could not make out that under such circumstances a rook ever descended for the purpose of recovering what it had lost. They seemed to bear their misfortunes in a philosophical manner, and set to forage again without delay. At the end of a week's work the nest I was especially watching began to assume its veritable form, the female was able to sit in it, but would hop out on the return of her partner, in order that he might the more conveniently continue the building or lining process. At a certain point the nest is supposed to have attained a legal settlement, after which both birds may leave home with impunity. In about a fortnight the dwelling is complete.

Up to this time, the entire colony leave the building-places at night and proceed to their roosting-quarters in a body, which are frequently some miles away, generally in an extensive wood, which affords shelter from the wind. It is interesting to observe that in their course the number of the flock is frequently increased, being joined by parties coming from different quarters, and falling in amicably together. A short time since I witnessed quite a different movement. A large company was flying in one direction, when suddenly they wheeled round, and went through what reminded me of a series of military evolutions. Presently, they divided into two bodies, and set off in different directions, the stragglers on both sides making all speed to join their own relatives. Had this happened at break of day, I could have accounted for the circumstance, seeing that the rooks—which of all birds are amongst the earliest stir—quit their night-quarters in large flocks, some of which diverge at certain points for the purpose of repairing to their several building-stations. As it took place in the evening, I looked upon it as somewhat peculiar, but I have since frequently seen the same thing.

As soon as the period of building is over, and the time for laying their eggs has come, the rooks take up their permanent quarters beside their nests. And now the female begins to display all the blandishments of coquetry, ruffling her feathers on her partner's approach, cawing at him fondly with outstretched neck, then striking him playfully with the tips of her extended wings. All this is followed by what many have mistaken for a battle-royal, when in reality it is quite the reverse. Though rooks do quarrel and fight occasionally, their general disposition is more peaceful and amiable than they receive credit for. Their fighting propensities have been grossly exaggerated.

In a week or ten days they usually have four or five eggs in the nest, and then the process of

incubation begins. During this time the male bird is most assiduous in the discharge of his domestic duties. He brings home abundant food for the use of his sitting mate, and occasionally takes her place in the nest, whilst she goes abroad, it may be for an airing. About the middle of April, the young birds may be heard giving utterance to a squeaking note, whilst the parents send forth a gobbling kind of sound. Their labours in bringing food for their young are unwearied, commencing with the first streak of dawn for the 'early worm,' and finishing only at nightfall. Sometimes they return from the fields singly, sometimes together, to their clamorous brood. And so the daily round of labour goes on until the young birds are 'branchers,' and the branchers have flown.

Rooks have their partiality and their aversion to certain classes of other birds. Jackdaws and starlings are free to visit the colony without fear of molestation, but not to build there. If a magpie, however, should put in an appearance, a great commotion would be the immediate consequence. I have seen the latter bird compelled to beat a retreat when followed by several black gentry, who assumed a very threatening attitude. On such occasions the pie is wont to give vent to what I interpreted to be very much like a torrent of abuse rebutted in a decidedly cursory manner. On one occasion in particular, my attention was attracted by this kind of controversy, so much so that my curiosity was aroused to discover, if possible, the cause. I soon found that an unfledged rook had accidentally, as I suppose, dropped from its nest, and was lying dead on the ground. This the magpie desired to remove, but however good its intention might be in a sanitary point of view, the strong prejudice of its opponents would not permit the thing to be done.

Rooks have frequently taken up their quarters amidst the bustle and constant traffic of public thoroughfares, apparently unconcerned about the passing and repassing of the crowd; but when their abode is situated in a remote district, they are extremely susceptible of the approach of strangers. Even the appearance of a strange dog or cat is, in some cases, a sufficient cause for exciting a great noise and commotion; whilst those which belong to the place would attract no attention whatever.

In common with other kinds of birds, rooks will sometimes help themselves to fruit, newly sown corn, and the young tubers of potatoes; still, the incalculable good they do in clearing the earth of grubs, so destructive to crops, is surely more than a compensation for such depredations.

The second or third week in May is usually considered the season for rook-shooting. At the first discharge of a gun, the old birds make off, or soar so high as to be beyond the reach of the shot. The young birds only remain, and aim should never be taken at them except when they are on the wing. It is not considered fair to bring down branchers, unless it be imperatively necessary to greatly thin their numbers; but the practice sometimes resorted to of killing them in the nest is one that deserves the utmost reprobation.

It is a mistake to suppose, as some have asserted, that when the young broods are reared, and are able to take care of themselves, the nests and rookery are deserted until the following year. It is true the whole company of birds do not constantly remain there, and some days, or even a

week or two, may elapse without any such visitors being observed. At the same time, they may be seen in the neighbouring fields plying their beaks in the soil in comparative silence, or following the plough at a later period, for the purpose of picking up the grubs which have been turned up from their subterranean hiding-places. This desertion is not continued for a long period. A sudden visitation may take place at any time, and, judging from the noise that is often made, the rooks on such occasions transact important business. At other times, and especially in the winter season, about a dozen birds may be seen busily occupied in the work of inspection; and I have been led to imagine they were a deputation of surveyors, authorised to look after and report on the condition of the general property. That they have any extraordinary prescience concerning the decay of trees, there is considerable reason for doubt; and that they have been so far affected by the removal of a family as to desert the locality, must be traced to the lively imagination of the poet.

FALLEN FORTUNES.

CHAPTER XII.—SYMPATHETIC INK.

THE days at Riverside went on as of old: there were croquet-parties, riding-parties, water-parties, during the daytime; and in the evening there were dinner-parties, dancing-parties, and charades. The house was neither gayer nor less gay than it was wont to be, and in all these entertainments John Dalton bore his part—which was always the chief part. He possessed the reputation of being the 'life and soul' of every social gathering, and he had to sustain it; just as a great nobleman must 'keep up' his vast estate, although he is in reality as poor as his meanest tenant. It was not so difficult a task as many would imagine. The high spirits which had hitherto carried him so bravely and buoyantly on the very top of the wave, it is true, had vanished; but the light manner and the sparkling wit remained; they had become as natural to him as pomposity or melancholy to another; and it needed a keen observer to note that paste had taken the place of the diamond. It was only remarked of him that he was growing cynical, a condition at which most men of wit and pleasure arrive long before his time of life.

Jenny indeed had gravely asked: 'Mamma, what is the matter with dear papa?' And when her mother had answered: 'Nothing, darling,' she came to the conclusion there was something very bad indeed. But Jenny, as we have heard her observe, was a looker-on at the game of life, and saw more of it than the players.

On the third day, the answers to John Dalton's applications to his friends began to arrive; each of them a page of human nature, complete and characteristic in itself, yet differing from all the rest only in degree. He was a man too popular with the crowd—for the 'crowd' is a term that suits with the highest fashion and the most cultured minds, as fitly as with the lowest and the most ignorant—to have secured the best sort of friends: he had 'dulled his palm' too much with welcoming mere comrades, to have grappled to himself true men with hooks of steel; that kind, perhaps, did not exist in the society among which he had

moved, and where *camaraderie* rather than friendship was cultivated; but such hearts as there had been to win, he had really won. He did not receive one letter such as satirists have described as the reply of a rich man to a ruined one. No man absolutely turned his back upon him, or offered him a five-pound note in compromise and farewell.

His knowledge of the world had doubtless prevented him from applying to the intrinsically base. Yet these letters were very various; there were some that brought the blood into his cheek for very shame, and some the tears into his eyes, with their outspoken tenderness and generosity. There were apprehensive letters—or what, perhaps, his soreness only took for such; letters in which he thought he read a fear lest the writer should be called upon to put his hand into his pocket; and there were letters in which such offers as the following were to be found, couched in more or less delicate phrase: 'As to money, my dear fellow, though you do not mention it, and I am afraid would be backward in doing so, pray, remember, if you should want a banker, to apply to me.'

Three letters in which that suggestion was made came from very wealthy men, who had never in their lives known what it was to want a shilling, or a thousand pounds. If they had made their money, their readiness to appreciate the want of it in another would have been less surprising. As it was, their generosity overwhelmed him; while it pricked his pride only a very little, for he had not the smallest intention of taking advantage of their offers. These last two classes were, of course, at the opposite ends of the scale of his correspondents. Between them, came a number of replies representing less marked varieties of character. What was most displeasing to him were the conventional condolences which were expressed, and especially the confident expectations the writers affected to entertain that all things would be well with him by-and-by. 'A man with ready wit like yours,' some said, 'cannot long be without some profitable employment'; and one even wrote that 'he could hardly help congratulating a man of such abilities that he would be now compelled, though the compulsion for the moment might seem irksome' ('Confound his impudence!' exclaimed Dalton in a fury), 'to apply them to the benefit of the state; for, as to his getting some high post under government, there could not be the smallest doubt.'

As to this last, almost all his friends were agreed in the same view; they had not 'the smallest doubt' that he would get something—and at once, added the more sanguine—'which would relieve him from his anxieties, and perhaps place him in a more agreeable groove of existence than he had hitherto occupied.' Only a few honest friends allowed that he was 'in a hole,' and hoped, evidently against hope, that he would be soon out of it. He noticed, with a bitter smile, that these last persons had themselves been place-hunters in their time, and understood the difficulties of the pursuit.

For the rest, the answer to the main question which he had addressed to each was in every case the same, and identical with that given to all beggars: 'I am very sorry, my good man, but I have nothing for you.'

Dalton felt that they had spoken the truth; but the truth was only less bitter than if they had replied: 'We have something, but we will not give it to you.' Such would in effect be the answer of Sir William Skipton, he knew, no matter in what terms it was conveyed, and he was not going to put himself in the way of such a rebuff. He had already exhausted every channel to which he might reasonably look for aid, and it was idle indeed to make application in less likely quarters.

A day or two more passed by, and the last of the replies had reached him. They all told the same tale. There was nothing for him but to wait and not hope: there was no ground, in truth, to build ever so small a hope upon. He had laid all the letters before his wife, and she had perused them with infinite care; not glancing through them with a sort of scornful impatience, as he had done, and then throwing them aside, but well weighing every word, and from some extracting here and there a grain of comfort. But her great consolation and hope of help lay elsewhere altogether.

'John, dear, God will never forsake us; however we may have deserved His wrath, He will never leave our innocent children to starve.'

'You have deserved nothing but good of Him,' cried Dalton passionately. 'That is what makes it so bitter to me.'

'O John, how can you talk so!' pleaded she earnestly. 'We have little—at least I am sure that I have fallen very, very far short of my duty, and many times; and even if it had not been so, if I had been what your blind love supposes, does not St Paul himself call himself the chief of sinners?'

'Yes; but he did not believe it; or if he did, he had his reasons: you never went about persecuting people, for example, to persuade them to be Pharisees.'

'O John, John! I beseech you, whatever happens, do not give up your faith. It is certain we are all sinners.'

'I am quite willing to own as much in my own case,' answered her husband. 'I don't say I have not deserved even such a blow as this: but as for you and the children—you will not tell me, I suppose, that Jenny, whom nothing but a miracle could have healed from the first, and who will now perish from sheer lack of means to save her—has deserved it?—There, darling; I am sorry: don't give way like that. I was wrong, very wrong, to talk so, but I feel at times so desperate. It is over now. You shall never hear me question the decrees of Fate again.'

He kept his word to her from that hour; but in his heart he did still question them, and resented them; for bright, and even brilliant, though it was, John Dalton had a very undisciplined mind. Moreover, he had been all his life a favourite of Fortune, and now that she had turned her back upon him, he was as furious as a lover who has just been jilted. The world was not only out of joint with him, because this *Lara* mine had turned out an ill success, but both worlds. The whole system of the universe seemed to him either to be thrown out of gear, or to be wrong *ab ovo*; a state of mind which will appear not only intensely wicked, but absurdly unreasonable—to all persons who have not experienced a like misfortune. In sober fact, the three thousand pounds or so which

still remained to him, and which some would no doubt regard as a small fortune, seemed to one of his habits a mere stop-gap—a halting-place upon the road to ruin; and in his place, it would probably have so appeared to most of us. He felt himself 'going under'—not, indeed, at one plunge, but quite as surely as though it had been so, and that he was dragging with him those he loved into the depths of poverty—a condition which they were utterly unfitted to endure. Escape for himself there was none; he no longer looked, or wished for any such; but how to rescue his wife and children was a problem that was never absent from his mind. And at last a plan occurred to him. He had had it, fitfully, in his mind before, but had always discarded it for a certain reason; but now it was suggested to him anew by his host, of course unwittingly, since he had not been let into the secret of his misfortune.

Mr Campden was a man who, though not exactly what is called 'self-made,' had risen from comparatively small beginnings; his father had had a moderately good business, which enabled him to send his son to college, where he had first become acquainted with Dalton; and this business—it was type-founding—the younger Campden had greatly extended. But the mass of his fortune had arisen from the eligible investment of his savings. It was a maxim of his never to sell what he had once bought; he held on to it through good report and evil report, and in almost all cases—even when the stock was depreciated—had found his account in doing so. He contended that in this consisted the great advantage which a rich man possesses over a poor one in the matter of speculation—that he can afford to hold on.

He had shares in every description of property: in banks, in railways, and in ships; and taking them all round, his investments had been very fortunate. He was the last man to boast of his wealth—purse-pride was a sentiment utterly beneath and foreign to his wholesome nature; but he did plume himself a little upon those transactions which had done credit to his judgment.

Some ten days after the misfortune that had befallen his guest, a certain dividend came to him by the morning post which afforded him unusual satisfaction.

He threw it across the table with a chuckle, and bade Dalton look at it. How little he knew that he was behaving like the cruel school-boy to his hungry class-fellow: 'Do you like cake? Then see me eat it.' He would rather have cut his hand off, or at all events a finger, than have insulted the ruined man with the display of his good fortune.

Dalton ran his eye over the sum-total, which was in four figures.

'You must have a heap of money in the concern said he carelessly, 'to produce such a dividend as this?'
 'As to this?' replied the other gleefully; 'but it for ~~our~~ paid less than ten per cent. since the go on to my advice in a certain matter. It's in the *Palm Branch Insurance Society*.
 themselves died Dalton as coldly as before; but while their ~~our~~ rush to his cheeks, and then ebb almost infallibly *Branch* was the company in of the folk-lore 'as was insured for five thousand Inlander is rejoy was it you raised the dividend, as a poor

'Well, it was the simplest thing in the world. I had long noticed that the insurance companies that were most popular with the public are those which cover every description of loss, and which do not haggles about exceptional risks. A man don't want to go to the Cannibal Islands—and as a matter of fact doesn't go—but he also does not like to be told that he may not do so if he chooses. Well, I, as their chairman, persuaded my brother-directors to sweep all these restrictions away, and the results have been surprisingly satisfactory. Our applications for policies have almost doubled, and yet we are not a penny the worse. A man may even join the *Palm Branch* and cut his throat the next morning if he pleases, and yet his widow will get her money.'

'And nobody has ever done it?'

It seemed to Dalton, as he put this question, that every one was looking at him, though for his part he looked at none, but toying with his tea-spoon, stared at the bottom of his cup. His wife, he felt certain, had her eye upon him, and Holt also.

'Of course nobody has done it,' returned his host contemptuously; 'and it is ten thousand to one that nobody ever will. If he does, so much the better for us. We should pay his policy in a month by the increase of our clients. "The *Palm Branch* for our money," they will say, "for it makes no objections to anything." Other companies are already copying us so far as to allow their people to put an end to themselves after six months; but that is a half-measure which will do neither good nor harm. It is the most satisfactory suggestion in the way of business that ever I made.'

'I think it a very horrid one,' remarked Mrs Campden sententially.

'Then you mustn't drive your new pair of ponies any more, my dear,' was her husband's quiet reply, 'for the price of them came out of it.'

'Well, I suppose it is not so bad as it looks,' returned the hostess, in a more mitigated tone; 'but on the first blush of it, it appears almost like a premium upon suicide.'

'No, my dear; the suicide pays the premium, not we; though, perhaps, he may only do it once.'

'I do not see anything to joke about, Mr Campden, on so shocking a subject,' observed the lady austere, as she rose with the rest of her sex from the now finished repast.

'I assure you, my dear, I only wished to remove your scruples about those ponies. They are really not the price of blood, because nobody has yet reaped any advantage from our new arrangement. There is, perhaps, a little temptation to some of our clients, when they shave; but as to using their razors for—'

'Ugh!' interrupted the lady, as she swept out of the room in the rear of the retreating force. 'Don't talk of such things, I beg. If that is what you call humour, I am glad I don't understand it.'

'Now, my wife would drive those ponies, Dalton, —and with just as great satisfaction if half our board of directors should cut their throats to-morrow,' observed Mr Campden, as the door closed behind her.

'But not if the chairman did it, I hope?' said Dalton, smiling.

'Well, I think in that case she'd wait—perhaps a week,' answered the host with a cheerful laugh. His dividend had put him in great good-humour.

For the moment, nothing more was said, but when Dalton and his host were presently smoking their cigars together in the garden, the former resumed the subject.

'I suppose,' said he, 'this obliging permission of yours, to all whom it may concern to make away with themselves, is not retrospective? You don't allow people to do it who have insured with you under the old system?'

'Well, no; because there is nothing attractive about that to new clients. But at the same time there is some doubt—at least so our secretary thinks, who is a lawyer—whether they might not take advantage of the concession if they would. It seems deuced hard that a man who has insured with us for twenty years, for example, may not blow his brains out if he pleases, while any fellow who joined us yesterday enjoys the privilege. For my part, however, I think the law would be upon our side; and—setting aside that the thing is a crime—the Gospel too. We have agreed with the old set for a penny a day, and if we choose to give the new ones twopence, the former have no right to complain.'

'You mean no legal right?' observed Dalton, to whom a parable from the Scriptures had just now no overwhelming force of conviction.

'Well, yes. Of course there would be something to be said morally—if the subject admitted of morals—upon the other side. The man who had insured with us for twenty years, for example, would certainly not be as guilty of fraud, if he were to commit suicide and to conceal it, as he would have been had our new system never been inaugurated. There would, at all events, be more excuse for him, since his case would—by comparison—be a hard one.'

'And yet I suppose you would not pay a policy thus forfeited?'

'Yes; I should recommend it to be paid, because I think it would be *our* policy to pay it. It would be a most splendid advertisement, and would not cost more than the usual method of advertising. You have no idea what a lot of money is spent in that way even by an insurance company.'

And Mr Campden went off into statistics upon that subject, and the topic of life insurance was dropped.

Mr Campden was a man of large ideas in business transactions, and hated details unless they were of real importance; he had never had the curiosity to peruse the list of policy-holders in the *Palm Branch*, and was quite ignorant that his guest—who, on his part, never troubled his friends with his own affairs—was insured in it.

Mrs Dalton, whose parents had died while she was little more than a child, had come of age shortly before her marriage, and, as we have said, had refused to have her fortune of ten thousand pounds settled upon her in the usual way, but had given the absolute disposal of it to her husband; and he in his turn—though at that time he had thought the money as safe from any act of his, as though it had been tied up by the most stringent of deeds—had insured his life for half that sum—namely, five thousand pounds. He had not dreamed, although the thing had thus been done in the way of a 'set off,' that this provision for his family would ever be a matter of great moment; but its importance, if 'anything should

happen to him,' had now become paramount. This sum added to the three thousand pounds which he still possessed, would secure them a competency. On the other hand, if he should continue to live on, the three thousand pounds would be spent all the quicker; for, instead of being the bread-winner of his family, he would only be the largest consumer of their bread; while the insurance itself would be a millstone about their necks, by reason of the yearly premiums, one of which, as it happened, was due in a month's time.

TRADITIONS OF THE ESKIMO.

AMONG the remarkable people with whose existence under the name of Esquimaux we have all been familiar from childhood, there exists a tradition that a small tribe in one of their long summer wanderings became separated from their brethren, and winter coming upon them, the possibility of retreat was cut off; that, accepting their fate, they established themselves on land situated immediately at the north pole; so that the happy man who ultimately succeeds in planting the flag of his nation there, is to find he has been preceded by a handful of people, who have contrived to exist for ages in a state of complete isolation from the rest of the world. In all probability, the events of the next few months will prove the basis on which this myth rests to be a very hollow and insufficient one. But meanwhile, it is certain that when Kane first visited Smith's Sound he discovered a small tribe of Eskimo living there, who were astonished to find they were not the only people on the face of the earth. The learned author of a little book which is now before us (*Tales and Traditions of the Eskimo*, by Dr Henry Rink), spent sixteen winters and twenty-two summers among this people, first as scientific explorer, and afterwards as royal inspector or governor of the southern Danish establishments in Greenland. Dr Rink's acquaintance with the language of the Eskimo enabled him to appreciate, and to take down for our benefit, the oral traditions; some of which, from very ancient times, had been handed down from father to son, and got themselves repeated in the long and dreary arctic night. Taken in the lump, and read by the uninitiated, these stories might only too easily be regarded as a mass of rubbish. But the practised eye detects the thread of gold that may be hidden in the lump of clay; and so in these wild, often apparently meaningless tales, our author has discovered relics of an early social (he uses the term spiritual) life, which, as he says, are surely as important when studying the history of a people's progress, as the ornaments, weapons, &c. which are so eagerly searched for in the very bones of the earth, as indications of material progress. The Eskimo are essentially a people of the back. They are seldom to be met with more than 800 miles or at farthest eighty miles from the sea. If we trace the extent of country, as they had turned line occupied by them, we find not more than a few thousand miles between those of the north and either the shores of Behring's Strait and the Gulf of St. Lawrence: a state of the extreme east of Labrador. Only intensely it is easy to believe how, so circumscribed a space, to all persons physically, they have become a source of misfortune. In tribes, some of which are not more than a few hundred or so which

existence of the rest. Dr Rink divides these tribes into a few principal sections.

1. *The East Greenlanders*, along the whole of the east coast of Greenland down to Cape Farewell, the southernmost of whom every year make bartering excursions to the Danish settlement nearest the Cape, and have intercourse with the next section. 2. *The West Greenlanders*, or inhabitants of the Danish trading districts from the Cape upwards to seventy-four degrees north latitude. 3. *The Northernmost Greenlanders*, or inhabitants of the west coast to the north of Melville Bay, or what Sir John Ross called the 'Arctic Highlanders.' 4. *The Labrador Eskimo*. 5. *The Eskimo of the Middle Regions*, occupying all the coasts from Baffin and Hudson Bays to Barter Island, near Mackenzie River. 6. *The Western Eskimo*, who are the nearest akin to the Aleutians and the inland Eskimo, and shew traces of intermingled Indian blood. And lastly, the *Asiatic Eskimo*, with whom we are not at the present moment concerned, since it is of the people settled principally on the coast of Greenland that Dr Rink writes. It has been usual, until very lately—that is, till after the introduction of Christianity amongst them—to speak of these people as savages, without law, order, or religion. A superficial way of regarding them, very possible, as Dr Rink observes, to those who only went ashore for a few hours, and proceeded in some vague way to question a people with whose very language they were unfamiliar, and then returned home full of the results of their investigations. It would be curious to know what a nineteenth-century Eskimo, suddenly landed at Wapping or Glasgow, might report of us after an hour's scrutiny!

But this superficial mode of obtaining information is in the course of giving place to more accurate and painstaking inquiry. We no longer believe in communities existing without some binding laws, or in any considerable bodies of people uninfluenced by a religion or by some superstition which bears its name. But the first inquiry concerning the Eskimo which is of real interest to us is, Where did they come from? Their origin is extremely obscure, but it is evident on the surface of things that the inhabitants of these polar regions must have migrated from more southern latitudes, and have gradually accommodated themselves to the changed circumstances in which they found themselves placed. Dr Rink, after careful study of the subject, believes that the Eskimo were not originally a coast-people at all, but far more probably emerged from some interior country, and followed the river-banks towards the shores of the Polar Sea. The result of his investigations and those of Lewis, Morgan, and others, would point to the primitive hunting nations of North America having obtained their principal subsistence from the rivers, especially by salmon-fishery. As these primitive people expanded, they of necessity drove out one another in the struggle for subsistence, and those so driven out would go on to the sea-shore. Here, says Dr Rink, in the polar seas the new settlers would find themselves rich in the means of sustenance, while their attitude towards the Inlanders would almost infallibly be hostile; and so we find in most of the folk-lore which originated at this time, the Inlander is represented as an enemy to be dreaded, as a power for evil, as capable of almost

any amount of villainy, accused of cannibalism, witchcraft, &c. By a careful comparison of the tales with existing geographical conditions, Dr Rink considers they all point to an American rather than an Asiatic origin; but he admits the possibility of early intercourse and subsequent mutual influence existing at some remote period between the northernmost nations of the two continents. The Eskimo appear even in remote ages to have been familiar with trade, and to have undertaken some of their longest expeditions in order to barter soap-stone, whalebone, walrus' teeth, skins, lamps, and even *kayaks*, or boats. The articles regarded by them as most precious for purposes of exchange were those made of metal or other materials possessed exclusively by foreign nations. Their mode of life necessitated from a very early period the development of considerable ingenuity; for being very much dependent for their means of sustenance upon the capture of seals, which afforded them skins for clothing, and blubber for oil and food, their hunting contrivances were at once clever and peculiar. Dr Rink's description of some of the implements used by them is interesting, as furnishing evidence of the progress in the arts of life which must, in very early times, have been made by this people. For instance, their kayaks, or shuttle-shaped boats, made of a framework of wood covered with skins impenetrable to the water; the manner in which the kayak was covered, so as to provide entire shelter for the kayaker, or seal-hunter; the adaptation of a bladder filled with air to the harpoons or javelins, to prevent the harpoon sinking should the hunter miss his aim; and the sledges with their trained dogs—all point to something other than mere savage life.

With the dwellings and dress of the Greenlanders, most of the readers of any history of arctic discovery are sufficiently familiar; but there are a few facts concerning their mode of life which are noticeable here. They may, our author says, be considered, broadly speaking, as possessing no regular property. 'They only possess the most necessary utensils and furniture, with a stock of provisions for less than one year; and their belongings never exceed certain limits fixed by tradition or custom.' The owner of a boat or tent is considered as the head or chief of the family, and his small possessions lay upon him a considerable responsibility, since upon such head or chief devolves the duty of providing not only for his wife and children, but for the unmarried women, widows, or unfortunate relatives who may be immediately connected with him. After the tie of family comes that of house-mate, it being very general for two or more families to dwell under one roof; then that of place-fellows, or inhabitants of the same wintering-place, who were all expected to render each other help, and to share with each other all surplus gains in food and clothing. No one was allowed the chief place, or to usurp authority over his fellows. There is abundant evidence in the folk-lore that any one seeking such pre-eminence was speedily killed, and his death regarded as a public benefit. Every grown man was bound to become a sea-hunter, and earn a living for himself and those for whom he was the acknowledged provider. Even the most ancient of these unwritten laws seem founded on a strong sense of justice; and

the way they were enforced simply by public opinion strikes us as quaint, and not without a sense of humour, affording evidence of intelligent sensitiveness, such as we should hardly have looked for amongst a people so situated. The evil deeds of the transgressors of these unwritten laws were recounted in public in satirical songs, and this punishment seems to have been as effective a deterrent as more modern inventions. The necessity for a friendly mode of speaking among people so dependent upon each other, made quarrelling to be considered as unlawful; and Dr Rink asserts that the Eskimo language is devoid of any real words for scolding.

The ancient religion of the Eskimo is a more difficult matter to determine. The last pagan among them died only a few years since, and many of their ancient superstitions have become mixed up with the faith they have learned from Danish and Moravian missionaries. But with the help of the tales, traditions, and folk-lore which the people still treasure, and which men living among them, as Dr Rink did, are able to study, much may be gathered concerning their old superstitious notions.

The tales, from which it is possible to extract many of the ancient customs we have thus briefly outlined, contain also indications of the first attempts at culture in the effort to provide tools or weapons from the rough material which lay at hand. Thus, we have a needle of reindeer bone, spoken of as a precious treasure, in a story valueless but for that sentence. And in another, the taming of animals for the purpose of sleighing is alluded to. Or we find a man at work at a boat with no tools but only a heap of shells to work with: in this story the *Inlanders* are represented as having knives and being rich; and Kumagdlat, the hero, goes off in search of the rich people, and returns laden with knives with 'beautiful hafts.' A few of the stories allude to the ancient Scandinavian settlers in the country, but for the most part they deal simply with the marvellous; with crude variations of ideas which in some form are to be found in all folk-lore; occasionally, with elves, whose adventures rival those of *Alice in Wonderland*; and in at least one instance—but that must be a story of modern date—we have allusions, but too well understood in every Greenlanders' assembly, to acts of violence committed by European visitors; and an extremely satirical description by the kidnapped Eskimo, on his return home, of the European town to which he is taken. But perhaps we could hardly give a better illustration of the general crudeness, and love of the merely marvellous, displayed in these stories, than by repeating one of the shortest, which has the advantage of connecting itself in our minds with a spot on which, just now, so many eyes are fixed. The story is told by the Greenlander thus: 'Of the southernmost part of Greenland, an island was situated, which some of the inhabitants of the mainland took a dislike to, because it cut them off from the open seas. Two old men got the idea of removing it by help of some magic lay. Their names were Nevingasilernak and Nivfigfarsuk; but another oldster, called Kiviarutajak, rather inclined to retain the island. The first two went in their kayaks to fasten a hair from the head of a little child to the outside, while the last from shore tried to keep it back by means of a thong of seal-

skin made fast to it. The two old kayakers then pushed off, chanting their spells, and tugging the hair. At length the thong burst, and the island got afloat; and continually singing, they pulled away to the north, and placed it in front of Kulissat. It is now Disco Island. The translation caused the bottom of the sea to rise all along where they travelled.' A glance at the map will shew the humour as well as the absurdity of this legend.

LOCHVIEW.

A TALE IN THREE PARTS.—PART III.

AFTER the evening of the garden-party, things, somehow, did not go on smoothly in Mrs Forbes's house, and I daresay I was a little to blame in the matter. In the first place, I withdrew myself from the conspicuous position I had too often taken beside Alice, and she withdrew her smiles accordingly. Many and broad were the hints that ere long fell from the maternal lips about the state of her daughter's health and spirits.

'Something,' said she, 'preys on dear Alice's mind, Mr Allen, for I'm sure her ailment is a mental one, she pines away in such a hopeless kind of manner. Will you try and find out what is the cause of her depression? I'm sure she always makes quite a confidant of you, and she would be certain to tell you.'

But I did not accept Mrs Forbes's permission to pry into her daughter's secrets; rather, I kept as much as possible out of the way. Early at office, and late in returning, never had Mr Forbes found such a willing helper before; and the deeper I went into the work, the more I was puzzled at the number of things Sandy had in hand. I heard of shares in joint-stock companies—of companies that had collapsed, or which were about to be floated—of financial agencies, of commercial panics, and so many other terms, that I marvelled much at the multitude of irons Mr Forbes had in the fire; but I did not then suspect how too many irons are very apt to exhaust the vitality of the coals, and put the fire out altogether. I admired the versatility of his genius, and was amazed at the wide range of his ambitions, that spread far away out of the usual well-trodden but safer path.

One evening there was to be a musical party at the square—not a large one, for Mrs Forbes said: 'Dear Alice could not bear the fatigue of a crowd, while her health was so shaken.'

I felt this was a thrust at me, and had a flush of consciousness on my cheek as I turned away from the lady, and retreated to the library, where I hoped to have a little quiet reading before the company arrived. But it was not my good fortune to read a single page that evening, for, ere I had seated myself, I heard the door softly open, then a rustle of silk and a faint sigh. Turning round, I saw Miss Merritt had come in, and that she was dressed for the party.

'Oh, I only want an almanac from the shelf, Mr Allen; pray, don't let me disturb you.'

She was stretching up to a shelf rather above her reach, so I started over to assist her.

'There, now; I am disturbing you. How stupid of me! and your time is so very precious now, Mr Allen.'

'Yes; I don't find much time to spare. This is the almanac, I think.'

'Thank you very much. But do tell me what I have done to offend you, Mr Allen? What has changed you so?'

'Am I changed?'

'You are indeed; I would give the world to regain your friendship. What have I done? what have I done to you?'

A mist, very like tears, had risen in her eyes—at least there was something in her emotion that resembled crying; and I hate to see a woman cry; it quite irritates me. Looking at her straight in the face, I suddenly hazarded: 'I don't think Willy Dykes would approve of your setting such an intense value on my friendship as to wish to give the world to regain it. Ask him if he would, when next you write to New York.'

I never saw such a change in any one as came over Alice then. The sentimental expression fled from her face, and she turned on me the full force of a pair of passionate, flashing eyes.

'Who told you about Willy Dykes? That viper, Hester Carew, has been trying to prejudice you against me.'

'Miss Carew has done nothing of the sort. I never heard her mention Mr Dykes's name.'

'Then somebody has been acting spy, and if I only knew who it was, I'd—I'd—'

'Be calm, Miss Merritt. I am not angry at your having a lover in New York—indeed I am glad, and I hope you will both be very happy together some day.—I hear some of the guests arriving. Will you allow me to lead you up-stairs?'

Alice looked at me for a few moments, as if undecided what to do; then, with a haughty bow, she took my arm, and we walked up the broad stairs, and reached the drawing-room. There I discovered Hester, as usual apart from the others. Seating myself beside her, I asked: 'Have you been singing any of your songs lately?'

'Not once, Mr Allen.'

'What a pity! Why haven't you been practising?'

'Because—oh, because the piano is always locked now.'

'What a horrid shame! I'll speak to Mr Forbes about that.'

'Please, don't, Mr Allen; promise me not to mention it to him. He's away so often, and he could not possibly help it.'

'Perhaps not. I'm very sorry you can't practise, though, music seems such a pleasure to you.'

'Oh, it is a pleasure—the greatest I know, almost: I never feel tired or unhappy when I'm playing or singing.'

We were beginning to enjoy our little conversation, commonplace though it was; but I saw Alice

Merritt was intently watching us, and presently she whispered something to her mother. So I was not surprised that little Hester was called out of the room soon after, on some pretence or other, to be seen no more that night.

Not long after this, Mr Forbes called me one day into his private office.

'Sit down, Master Alec; I want to have a little talk with you. You recollect you have often urged me to give you a deeper insight into our business; are you still of the same mind?'

'I certainly am. All the time I have been with you my experience has been most superficial. The merest tyro could have done as much as I have done.'

'It was needful to give you a trial first, Master Alec. Gentlemen like you don't often settle down to business. When the novelty is over, they throw it up. Now, I have a proposal to make.'

He bent over his papers for some time, and then hesitatingly it came out that he wanted me to enter into partnership with him, to share the profits, and likewise—the risks.

'I have not much money to bring into the concern,' said I.

'No, Master Alec; I know that; but your name will have some weight, and we shall be able to extend our connection and influence.'

'I must consult my father about it before I give an answer,' I replied.

'You are of age, Master Alec.'

'Yes; but all the same I shan't do anything without my father's advice. Yours is a paying business, I presume.'

Sandy looked up from his papers, and his eyes met mine for the first time since our interview. What a hungry, haunted look they had! His face was ghastly, with a strange unnatural whiteness. What in the world had come over the man?

'Are you ill, Mr Forbes?'

'No; it's just that spasm at my heart again; 'twill be gone presently.' He sat quiet for a minute, then he turned over his papers nervously. 'There, I'm all right now. Of course ours is a paying concern. You surely cannot doubt it?'

I did not doubt it, and so I told him; and for an hour or more I sat there while he talked of his monetary transactions, and partially enlightened me about his mode of action.

My letter went off to Sir Dugald; and I determined, as soon as the answer came, I would change my residence. Now that some of the hidden workings of the family tactics were revealed to me, I had grown quite uncomfortable, and I wished to be away from Alice and her mother and all their machinations. The next morning, when I was rambling about the garden as usual, waiting for breakfast, I saw a little hooded figure dart down the side-path, and half hide itself behind a tree. It was Hester Carew.

'Is it true,' she anxiously inquired, 'that Mr Forbes has asked you to be his partner?'

'Yes; and I have written to my father for his consent.'

'Have nothing to do with it till you have inquired into his affairs. The night before last I overheard him tell Mrs Forbes he was on the brink of ruin; and she urged him to draw you into it. She said your name might keep off the blow a little longer; that it was his only chance.'

'Are you quite certain of that?'

'Yes; and I thought it such a pity. You could not save poor Mr Forbes from misfortune, and would only bring ruin and disgrace on yourself.'

'That I should, and on my father too. Instead of helping him, I should have heaped up misery on his head. I am so glad you have told me this, Miss Carew.'

'I could not help it. It seemed such a terrible wrong to you; so unkind, so wicked!'

'My dear girl, I shall never forget the service you have done me—never!—I would have said much more; but Hester did not wait for thanks, she was already drawing her hood over her head, and with a quick glance of her liquid brown eyes, so tender, so truthful, she darted away over the grass, the faded leaves rustling as she went.'

The next day, the expected letter from my father came, and he, in his own trustful manner, told me to use my own judgment; and if going into partnership with Mr Forbes would aid my interest, he gave his full consent to the step. But for Hester's timely whisper, I should have hailed this letter with satisfaction, and gone blindly on to my doom. Now, I was rejoiced it was not too late to withdraw from the proposed arrangements, which I accordingly did. As I was endeavouring to cut out some new and less hazardous business connection, an invitation reached me that I resolved to accept. It came from Mrs Stephen Grey, and was inclosed in a letter from my cousin Jessie. I have not mentioned the latter lately, but she had found Harry Western a more than sufficient substitute for me, and they had been married about three months. They were now on a visit to Mrs Stephen Grey's hospitable mansion, a few miles from Chester, and they wanted me to join them, and spend the Christmas there; so I set off at once, hoping to recover from my disappointment and annoyance and everything else. Jessie was as merry as ever, and ten times as happy. It was a treat to see her with her husband. Big fellow as Harry Western was, she led him about at her will.

It was while I was staying at this house, the grand crash fell on poor Sandy Forbes. The crisis had come, and he fled to escape the irate creditors. Many people were astonished at his failure, for he was supposed to be very rich; and no doubt at one time he had made a tolerable fortune. But a mania for reckless speculation had haunted him as fatally as a gambler's infatuation. He had gone on from bad to worse, forsaking the true, honest path, and plunging into wild and shady courses. I heard Mrs Forbes and her family had gone to Boulogne. She had a good settlement from her former husband; so poor Sandy's fall did not drag her and the girls down to misery also. I concluded Hester Carew had gone with them; and though there seemed but little chance of our meeting again, I did not forget her; I never could do that.

Shortly after my visit to Mrs Grey had terminated, I found myself once more in Liverpool, and rallying forth to have a look at the house, still dear to me for Hester's sake. It was shut up. I expected that; but I lingered about, looking up at the windows, and thinking already the touch of misfortune had made a great change in its appearance. Presently, to my surprise, the door opened,

and Mrs Wills, the old housekeeper, came out with her shawl and bonnet on.

'Oh, Mr Allen, sir, I'm so glad you've come. Do come in, sir, please.'

'I thought everybody was gone away, Mrs Wills?'

'No; poor Miss Carew is still here, and she's just breaking her heart, poor thing!'

'Left behind! Why?'

'Well, sir, the master went off to the country all of a sudden, and then the mistress and the young ladies went, and then the servants; and poor Miss Carew was left behind.'

'Is she alone in that great house?'

'No, sir; I stop with her. I wouldn't leave the poor dear. And—and—the bailiffs is there in possession.'

'May I go in and see Miss Carew?'

'I'm sure she'll be right glad to see a face she knows, sir. It was cruel hard to go away and leave her like that. Come in, sir, do.'

Mrs Wills opened the door a little bit, and we went in together. How dismal the place looked! The hall was littered with remains of packing, as though Mrs Forbes had taken away her boxes in a hurry; doors were locked, windows closed, cupboards and closets sealed up, and a couple of ill-looking men were stalking about. They eyed me with suspicion, and seemed about to order me out again; but when I said I had called to see Miss Carew, they sulkily pointed up-stairs.

'She's in the back drawing-room, sir,' quietly said Mrs Wills.

'Ay, and she'll have to clear out of it to-morrow, and so will you too,' muttered one of the men.

The large room looked chill and deserted, with its bare, fireless grate, and its tables and walls stripped of every picture and ornament. Hester was sitting beside a little table near the window, and before her were several letters. She started up with surprise when she saw me, and held out her hands.

'I'm sorry to see you here under such circumstances, Miss Carew.'

'Yes; isn't it all very sad? I am trying to get a situation as nursery governess at Mrs West's,' said she, looking at the letters.

Her lip quivered as she spoke. Going out to seek her way in the world must have seemed a bitter trial to one of her timid nature.

'Did Mrs Forbes purposely leave you like this?'

'Yes; she went away a week ago, and told me I must earn my own living now. Oh, that I were well educated and clever; but I can do so little.'

'It was very cruel of Mrs Forbes,' said I bitterly.

'And yet I think she would have taken me; but Alice would not hear of it. I can't think why Alice was so bitter against me.'

I could, though, but I did not say so then.

'Was Carrie averse to your going with them?'

'I don't think she cared one way or another. Carrie was kind even—she came back, and kissed me, and wished me "good-bye," and gave me some money out of her purse.'

'I am glad of that; I always thought there was some good-nature in Carrie. And so you've been here ever since?'

'A whole week now; and I've been trying so much to get a situation. I feel I'm only here on

sufferance, and it's dreadful to see those two men about the house.'

'I hope they have been civil to you?'

'I keep out of their sight, and Mrs Wills hardly ever goes out, or leaves me.'

Fain would I have pressed the poor trembling, lonely girl to my heart, and there and then have poured out the whole tale of my long-hidden affection for her; but with an effort, I restrained myself. Not for worlds would I have startled her with such demonstrativeness then, as she thus told her sorrows as to a brother.

I was on the point of saying: 'Come with me, Miss Carew, and I'll take you to my cousin Jessie; she will take care of you, for my sake;' but I recollected there were reasons why that could not be done, till I had first consulted Jessie herself on the subject.

'Will you remain here till you see me to-morrow morning?' I at length said.

'Yes, if you wish me to do so; I need not go to Mrs West's till the afternoon. I hope she will like me, and take me in, for I have nowhere else in the wide world to go.' The eyes were full of quick tears now, and she turned away to hide them. The situation was exceedingly trying, but I still strove hard to retain my self-possession.

'Do not be discouraged,' I implored; 'try and keep up your spirits for another day, Miss Carew. Remember you did me a great service once, and it is my turn to serve you now. Will you trust to me?'

'O yes; I will trust you.'

I resolved to consult Jessie without delay. So, after bidding a temporary adieu to Hester, I reached Mrs Grey's house, and told my cousin the whole tale; and, as I expected, her womanly heart was deeply interested. She came to the rescue in her own prompt way.

'Poor little creature! Only think of her deserted in such a way. Of course she shall come here. I'll tell Mrs Stephen Grey the whole story, and I am sure she will send her an invitation at once.'

'I knew I could reckon on you, Jessie,' I said, deeply touched.

'Of course, silly boy, you could. But Alec, what do you propose for Miss Carew's future? I know lots of people who have troops of children. Shall I try and get her a more profitable situation than nursery-governess to the little Wests?'

Jessie looked straight into my eyes, and what she saw there I can't say, but she pressed my hand, and whispered gravely: 'Conquered at last; poor boy! so you really care about her, do you? Then your Hester shall not take any situation at all, but shall come and stay with me as long as ever she likes.'

'How kind of you, Jessie! you overwhelm me with obligations,' I exclaimed, in a voice that I think was rather husky, for I was moved—despite my once boasted stoicism.

'Obligations! Indeed, they are all on my side, Alec,' retorted my cousin, with one of her bright smiles.

'How can that be?' I asked.

'Didn't you leave all the nut-picking for Harry Western last autumn? And wasn't it during those very picnics that I first found out how much he cared for me? When you and Hester are married, you and I shall be quits, but not till then.'

'I can never expect so great a happiness as marriage with Miss Carew,' I said, feeling half-dizzy with Jessie's rapid glance at such a possible future for me—for, in truth, the sketch seemed rather visionary, considering I had never yet spoken one word of love to the young lady.

The next morning—bearing Mrs Stephen Grey's invitation to Miss Carew—we all three drove to Liverpool—Jessie, Harry, and myself; and poor Hester looked pale and half-frightened as we all stood before her. But Jessie, with her usual impetuosity, soon banished restraint. She caught the poor girl in her arms, and embraced her as she would a long-lost sister. Then Hester brightened up, warmed by the influence of my cousin's manner; and it was a happy face, not a frightened one, that was presently turned towards me.

'How good you all are to me!' said the dear girl; 'what have I done to deserve such kindness?'

'If it is a burden to you, you can easily return it, Miss Carew.' I spoke softly, bending down to her, for just then Jessie had called her husband into the front drawing-room, where they were making a critical examination of a portrait of Sandy Forbes. Jessie was perhaps admiring this painting, or perhaps she was giving me the chance of being for a moment alone with Hester. So I drew nearer to her, as I whispered again: 'You can return the kindness a thousand-fold, Miss Carew.'

'How can I do that, Mr Allen? I am poor, and—and—'

But I had caught her hand in mine, and was passionately pleading my cause—pleading it in a low, rapid whisper. 'You can return my love. You can promise that some day you will be my wife. You will learn to love me—won't you, Hester?' The little hand was not withdrawn; the soft eyes were for a moment lifted to mine, and then instantly cast down, as a quick glow rose to her cheeks; but that one glance was enough; it told me all I wished to know, for I saw my pleading had not been in vain.

Jessie and Harry returned to the back drawing-room. The invitation was given, and joyfully accepted. A polite declinature was penned to Mrs West—the last letter ever written by Hester in the hated house.

Then she gathered up her few scanty belongings, and we prepared to go. The bailiffs had grown wonderfully respectful, for the sight of a carriage like Mrs Stephen Grey's will impress even bailiffs sometimes.

Hester and I both looked back at the old house as long as it was in sight. What her thoughts were I cannot tell; but when the carriage drove out of the square, she glanced up shyly and wonderingly at me. No doubt it was difficult for her to realise the present state of things; so I whispered softly in her ear: 'The old life has ended now, Hester, and a brighter and happier one has begun, I hope. Can you trust me fully?'

'O yes. I have never doubted you.'

I lay down my pen for a while, and leaning back in my arm-chair, look out on the grounds of Lochview, and see a picture calm and beautiful, and dear above all earthly things to me. I note the gambols of a youngster, with soft brown eyes, and curly locks, who flits about among the flower-beds like a butterfly. He is my son Murdoc; and the lady in white near him is my wife—once

Hester Carew. A letter has just been received with the news of Sandy's death and Alice's marriage to Willie Dykes. I pity the latter.

Our beautiful house, Lochview, is no longer under a cloud. It is free from all debt. Improvements on a large scale are going on; dilapidations are all cleared away; there is a stir of life and action about the place, and there is not a brighter, better kept domain in the county. 'But how was all this brought about?' asks one. All in a very simple way, my friend. When I returned home from Liverpool, no better in fortune than I was when I went away, my parents did not reproach or twit me, or say they knew it would be so—so I was not discouraged. And when I told them I was betrothed to a girl no richer than myself, they did not storm and rage, as some people would have done. My father recollected Fanny Stewart, Hester's mother.

'A sweet, pretty creature she was; I only hope the daughter will resemble her,' he said.

And when I brought home my bride from Jessie Western's house, where at my cousin's urgent request we had been married, she was received with open arms; and my father and mother took the darling to their hearts.

Ere long, Sir Dugald gave me up most of the management of the place, and told me to steer the bark out of the shallows if I could. I have tried my best ever since. Though I made no mark in the world of business, yet I brought home with me some business habits, that served me a good turn in after-days. I looked into the accounts of Lochview myself, and soon found the steward had been cheating my father frightfully for years past: the man was dismissed. Then the hounds and hunters were disposed of; and a splendid price they made. Also, the large staff of lazy, over-fed, rapacious servants were paid off; creatures who lounged about the place, turned up their noses at economy, and thought only of doing as little as they could for their wages. The tradition in our family had ever been that we must keep 'open house,' where all sorts of extravagance might go on unchecked and unrestrained. With our new set of domestics, this tradition vanished. Janet ruled the nursery, and Mrs Wills was the housekeeper under our new régime. My wife, my own Hester, was neither too lofty nor too silly to help me in my efforts. She regulates the household expenditure, and thus untold sums of money have been saved.

Acres of pasture-land we did not require have been ploughed up, and rich harvests of oats, wheat, and barley are now waving in the summer breeze in our fertile fields. Large portions of waste ground have been let out to good tenants, and two or three capital farms have thereby sprung up on the confines of the Lochview estate. But I should weary you were I to tell of all the draining and reclaiming of land that has been going on. With all this retrenchment, not one whit of our comfort is lessened. Our wants are amply supplied, thanks to a good Providence, and we are far happier than we were in those wasteful, riotous, scrambling days of old.

This, then, is the only magic that has been used. We have studied frugality, industry, watchfulness, and care, and a blessing has rested on our efforts. We have not lost one atom of true dignity, nor abated one particle of real nobility, nor sacrificed one fraction of self-respect. Happiness and peace

reign in our household like a perpetual sunshine. The hateful shadows of debt and dishonour are driven away from Lochview for ever; it is now ours in deed and truth, and can no longer be called an encumbered estate.

BOOK ABOUT THRIFT.

OUR old and ingenious friend, the indefatigable Samuel Smiles, known for his *Lives of George and Robert Stephenson, Self-Help*, and other works, has just added another to his list of useful productions in the form of a small handy volume under the title of *Thrift*. We are not going to attempt a review of the book, further than to say that it is a painstaking assemblage of hints, advices, and remarks on the subject of domestic and individual frugality, seasoned with pithy anecdotes collected from a variety of sources. The book, of course, is addressed chiefly to the manual-labouring classes, but the conduct of those in a higher social sphere does not escape criticism, and for all there is something which may be laid to heart. As an addition to village and town libraries, *Thrift* may be recommended as eminently suitable. We subjoin a few extracts.

Remarking in his plain way, that 'if a man does not know how to save his pennies or his pounds, his nose will always be kept to the grindstone,' Mr Smiles observes how very greatly good resolutions may be strengthened by the quiet and gentle encouragement of a thoughtful wife. That brings on a story told by a clergyman—a friend and adviser of working-people—relative to a man, a calico-printer, at Manchester, who was led to make an agreement with his wife on their wedding-day. The man was to allow 'her two half-pints of ale a day as her share. He rather winced at the bargain, for, though a drinker himself, he would have preferred a perfectly abstemious wife. They both worked hard; and he, poor man, was seldom out of the public-house as soon as the factory was closed.

'She had her daily pint, and he, perhaps, had his two or three quarts, and neither interfered with the other; except that, at odd times, she succeeded, by dint of one little gentle artifice or another, to win him home an hour or two earlier at night; and now and then, to spend an entire evening in his own house. They had been married a year, and on the morning of their wedding anniversary, the husband looked askance at her neat and comely person, with some shade of remorse, as he said: "Mary, we've had no holiday since we were wed; and, only that I have not a penny in the world, we'd take a jaunt down to the village, to see thee mother."

"Wouldst like to go, John?" said she softly, between a smile and a tear, so glad to hear him speak so kindly—so like old times. "If thee'd like to go, John, I'll stand treat."

"Thou stand treat!" said he, with half a sneer: "Has't got a fortin, wench?"

"Nay," said she, "but I've gotten the pint o' ale."

"Gotten what?" said he.

"The pint o' ale!" said she.

'John still didn't understand her, till the faithful creature reached down an old stocking from under a loose brick up the chimney, and counted out her daily pint of ale in the shape of three hundred and sixty-five threepences—that is, four

pounds four shillings and sixpence, and put them into his hand, exclaiming: "Thou shalt have thee holiday, John!"

"John was ashamed, astonished, conscience-stricken, charmed, and wouldn't touch it. "Hasn't thee had thy share? Then I'll ha' no more!" he said. He kept his word. They kept their wedding-day with mother; and the wife's little capital was the nucleus of a series of frugal investments, that ultimately swelled out into a shop, a factory, warehouses, a country-seat, carriage, and, perhaps, a Liverpool Mayor."

Speaking of men who have raised themselves to distinction by thrift, our author mentions the case of Joseph Baxendale, who was largely concerned in getting up the great goods-carrying concern of Pickford & Co. Baxendale was a man of strong common-sense, and might have been styled the Franklin of Business. He was full of proverbial wisdom, and also full of practical help. He was constantly urging his servants to lay by something for a rainy day, or for their support in old age. As to Pickford, who began as a carrier, Baxendale helped him with capital, organised his agencies, established relays of horses, went about night and day seeing after the vans, and keeping everything in working order. Then, when all had been put in fine condition, came the railway system, which knocked all the organisation on the head. Baxendale had more sense than to repine. He saw that railways were inevitable, and would soon drive him off the road. Like a wise man, he went over to the enemy. The business was transformed into a wide-spread system of collecting and sending on goods by railways.

"He," says Mr Smiles, "relieved the Liverpool and Manchester Company of a great deal of trouble, by undertaking to manage their goods-traffic, and by collecting and delivering it at both towns. Then, when the railways from Warrington to Birmingham, and from Birmingham to London, were projected, he gave evidence before the Committees of parliament in proof of the estimated traffic. And when the lines were made, he transferred the goods from his carrying vans to the railway. He thus became a great railway carrier, collecting and delivering goods in all the cities and towns served by the railways which had by that time become established. He also became a large shareholder in railways. His status in the South-eastern line was so great, that he was invited to become chairman of the company. He was instrumental, in conjunction with the late Sir William Cubitt, in pushing on the line to Dover. But the Dover Harbour Board being found too stingy in giving accommodation to the traffic, and too grasping in their charges for harbour dues, Mr Baxendale at once proceeded, on his own responsibility, to purchase Folkestone Harbour as the port of the South-eastern Company. He next proceeded to get up the Boulogne and Amiens Railway, which was for the most part constructed with English capital; and the direct line from London to Paris was thus completed." Ultimately, he was helped by his sons, but continued to the close of his life to take an interest in everything that was going on. Baxendale, in fact, was never weary in well-doing, and in offering good advice, the result of his experience, to all in his employment.

Some interesting notices are given of manufacturers who have risen to eminence through

frugality and good business-management, and who are noted for a generous attention to the interests of those they employ. Sir Titus Salt of Saltaire, who might be called the Prince of Manufacturers, is the son of a Yorkshire wool-stapler, and worked his way up by thrift, ingenuity, and enterprise. To this category of distinguished manufacturers belong the Ashworths at Egerton and New-Engley, the Struts of Derby, the Marshalls of Leeds, the Crossleys, and the Akroyds of Halifax, the Brooks of Huddersfield, and many others. "All these benefactors were originally men of moderate means. Sir Joseph Whitworth was a journeyman engineer. Sir Josiah Mason was by turns a costermonger, journeyman baker, shoemaker, carpet-weaver, jeweller, split-ring maker, copper-smelter, and electro-plater, in which last trade he made his fortune." We might specify the Tennants of St Rollox, as offering a remarkable instance of a stupendous concern springing up from small beginnings within two generations, all through painstaking professional skill and persevering industry. Nor might we omit the Brassies. But the enumeration of such cases would be endless.

A number of instances are given of improvidence keeping pace with increase of wages. We quote a few sentences. "In a large iron-work near Newcastle, where the men were paid the highest wages for rolling plates and rails - and where they were earning between three and four hundred pounds a year—the proprietors observe: "Except in a few instances, we are afraid that workmen and their families spend most of their earnings." Another employer in South Staffordshire says: "In the majority of cases, the men employed in the iron-works spend the whole of their wages before the end of the following week. There are, of course, some exceptions; but they are, unhappily, very few." Another, in South Wales, says: "As to the thrifty habits of the men, a small minority are careful and saving; they generally invest their money in cottage property. But the great majority of the men spend their money often before they earn it, and that in the most reckless way. Large sums are spent in drink: this leads to idleness; and, owing to drinking and idling, the works are kept short of men until about Wednesday in each week, when the greater part of the most idly disposed have become sobered down. Of course, when wages are low, the men work more regularly. There is less drinking, and altogether the condition of the place is healthier in every respect, both in a moral and physical sense." Another observer remarks, that the miners of Bilston are about six thousand in number, and they spend more than fifty thousand pounds annually in the purchase of ale and liquors."

The following is a curious case in illustration. "A clerk at Blackburn took a house for twenty pounds a year, and sublet the cellars underneath to a factory operative at a rental of five pounds a year. The clerk had a wife, four children, and a servant; the operative had a wife and five children. The clerk and his family were well dressed, their children went to school, and all went to church on Sundays. The operative's family went, some to the factory, others to the gutter, but none to school; they were ill-dressed, excepting on Sundays, when they obtained their clothes from the pawnshop. As the Saturdays came round, the frying-pan in the cellar was

almost constantly at work until Monday night; and as regularly as Thursday arrived, the bundle of clothes was sent to the pawnshop. Yet the income of the upper-class family in the higher part of the house was a hundred a year; and the income of the lower-class family in the cellar was fifty pounds more—that is, a hundred and fifty pounds a year! An employer in the same neighbourhood used to say, "I cannot afford lamb, salmon, young ducks and green peas, new potatoes, strawberries, and such-like, until after my hands have been consuming these delicacies of the season for some three or four weeks."

Mr Smiles emphatically adds: 'It is most disheartening to find that so many of the highest-paid workmen in the kingdom should spend so large a portion of their earnings in their own personal and sensual gratification. Many spend a third, and others half their entire earnings, in drink. It would be considered monstrous, on the part of any man whose lot has been cast among the educated classes, to exhibit such a degree of selfish indulgence; and to spend even one-fourth of his income upon objects in which his wife and children have no share.'

Should *Thrift* reach a second edition, as we hope it will, the author will have an opportunity of drawing some pointed examples of misspent time and money, from the late Report of the United States consuls to their government, concerning the labouring-classes in England. Comparing the social condition of English with American workmen, a superiority is assigned to the latter in consequence of their better education and more temperate habits. What the consuls say on this seriously important subject, may bear quotation.

'The English workman,' they say, 'requires a day or two to get over his Saturday night and Sunday drinking sprees. The extent to which the English labouring-class drink up their wages appears in a melancholy form in this Report. The consul at Sheffield reports that great numbers of workmen stop work on Saturday noon, and do not commence again till the following Wednesday. This is, in part, because they need Monday and Tuesday to enable them to recover from the effects of Sunday's drinking. "Increase of pay," says the consul at Birmingham, "means increase of drink." In Manchester, our consul reports that many sober working-women complained that increased wages and shortened hours of labour were a curse to the families, as the men were only the more tempted to drink. In Liverpool, there seems a wide-spread and fearful demoralisation of the labouring-class from their intemperate habits. And thus from almost all the manufacturing centres, our officials report a wretched condition of working-men's families, and reduced efficiency of labour from the habits of intemperance prevalent. A curious fact also appears in these researches—namely, that a rise of wages does not always produce more work. Thus, in the collieries of Leeds the product for each person in 1864 was 327½ tons for 313 working days, or 21½ cwt. for each person per diem. In 1868, it fell to 317 tons, or 20 cwt. per diem; in 1873, to 17½ cwt. for each person per diem. That is a reduction of production in ten years of 19 per cent., while wages have risen 30 per cent. and upward. In Manchester, the average earnings of a certain mine were 4s. 7d. per day in 1871; in 1872,

the wages had more than doubled, and yet the earnings were 2d. less per week for each man. The workmen averaged less than four working days per week, while many only worked three days.' The statement thus presented by the United States consuls regarding the terrible loss and degradation to the English labouring-classes produced by their thriftless drinking habits, will not be one of the least of the good results accomplished by this able Report.

THE MONTH:

SCIENCE AND ARTS.

SINCE our last notice of the subject, Mr Crookes has made further progress with his radiometer, and has communicated the results of his investigation to the Royal Society, of which he is a Fellow. His instrument, as our readers will remember, is a wheel made of straw, or pith, or some material equally light, which, in a vacuum, rotates by the mere action of light or heat. It is very surprising to see the little wheel begin to move round when the glass under which it is confined is touched with a warm hand, or on the approach of a candle. If two candles are brought, the rotation is twice as fast as with one, and so on with a larger number; and in full sunshine, the speed is almost incredible. 'Nothing can be seen,' says Mr Crookes, 'but an undefined nebulous ring, which becomes at times almost invisible. The number of revolutions per second cannot be counted, but it must be several hundreds, for one candle will make the radiometer spin round forty times a second.'

It is an evidence of progress in the inquiry, that radiometers of different forms can now be made, and their movements exhibited to a large audience, while others keep a telegraphic account of their rotations on a self-recording instrument.

This seems curious; but is it of any use? The answer is, that Mr Crookes has already discovered two practical applications which promise to bring the radiometer into general use as a philosophical instrument: one is a photometer, or light measurer, for artificial light; the other, for sunlight, or daylight. In the former case, the amount of deflection of the radiometer by a single candle, at a given distance, can be ascertained. The distance of a gas-burner that would produce the same amount of deflection, can also be ascertained. Mr Crookes found the correspondence took place when the candle was forty-eight inches distant, and the gas-flame one hundred and thirteen inches. This shewed that the burner was equal to five and a half candles; and here at once a standard is established. For, if at any time a burner of known power did not deflect the radiometer to the proper amount, it would be a proof that the gas was not of standard quality. Gas-consumers ought to rejoice in the thought of having so simple and effectual a check on gas-manufacturers. Another practical application is, a method by which light may be weighed. This, if Mr Crookes is not mistaken, will prove of high importance in science.

The sunlight measurer may become of service as a meteorological instrument, for experience has shown that it is important to keep a record of the amount of light that falls on the earth, as it is to note the rise and fall of the barometer, or changes of the wind. Professor Roscoe, F.R.S., of Owens College, Manchester, published at the beginning of last year a description of a 'self-recording method of measuring the intensity of the chemical action of total daylight,' being the outcome of an investigation commenced ten years previously; from which we may infer that the want of something of the kind had long been felt in the laboratory and the observatory. It is well for observers that they have now the alternative offered by Mr Crookes' radiometer.

Dr Tyndall's researches, which we noticed very briefly last month, may be regarded as a repetition in brilliant style of a demonstration made and established long ago. He, so to speak, proved a fact over again; but the advocates of spontaneous generation still maintain their argument, and contend that they can produce life from lifeless matter. While the controversy is going on, the attention of thoughtful minds will be directed to the subject, and beneficial results can hardly fail to follow. Dr Tyndall, in his latest experiments, approaches the question of infection. He shows that sewer-gas, though very offensive to the sense of smell, is harmless in itself, and is hurtful only when floating germs are mingled with it. The subject is most interesting, but we shall not say more about it here, as we understand it will be treated in a separate article in the present work a week or two hence.

Mr Lagot, of Pembroke College, Cambridge, has invented what he calls a 'patent safety indicator.' It might with equal truth have been called a danger indicator, for placed in a mine, a ship, a warehouse, hotel, or private dwelling, it makes known to any required distance any extraordinary pressure of the atmosphere from the presence of noxious gas or any unusual increase of temperature. For example, if an indicator were placed at the bottom of a mine, it would, when a rush of fire-damp took place, ring a bell in the office above ground; and in like manner, if buried amid the cargo of a ship, it would, if the cargo grew too hot, ring a bell in the captain's cabin. These two cases may suffice to suggest a great variety of applications of this useful invention. It resembles the aneroid barometer, and is made in pairs—the one to indicate pressure, the other temperature—and when in use, is connected by wires, which may be of any length, with an electrical battery. Thus, by ingenious contrivance, warning is given of every increase of pressure or of heat; and simultaneously with the ringing of the bell, an indicator falls, and tells the exact place of danger. Any one desiring to have further particulars of this praiseworthy instrument, should apply to Mr Apps, 433 Strand, London.

This does in another way what was done by Mr Siemens some time ago in detecting the heat in a coil of telegraph cable when stowed on board ship. We described his process at the time. Mr Siemens has now invented an instrument for telling the depth of the sea without the use of a sounding-line.

At a recent meeting of the Odontological Society,

a discussion arose on the tendency of certain teeth, especially the incisors, to elongate, and fall out. Such cases were said to be very common; and the chairman, Mr Coleman, mentioned that the occasion of the elongation was the want of 'antagonistic' teeth, which, by pressure in mastication, would keep the upper ones in their place. 'But,' he remarked, 'in the present state of society, when the food was presented to them in a softened state, and the knife and fork usurped the true office of these teeth, their early loss by falling out was very common. That it was greatly on the increase, there could be no doubt. When patients would not bear any mechanical appliances, he had recommended pressure by the finger or thumb; for example, that while employed in reading or any similar occupation, they should press the thumb gently, but steadily and continuously, upon the tooth. If that were persevered in, he thought they would find that after a time a considerable improvement would take place.'

That the sun has an atmosphere as well as a photosphere has long been known; and that the surface is less bright at the edges than in the centre has been taken as a proof that the atmosphere is an absorbing atmosphere. Calculations on the amount of absorption, and its effect on our earth, were made by Laplace and other astronomers; and of late years the spectrum has been used in investigating the question. Mr Langley of the Allegheny Observatory, United States, has just published the result of his steady observation of the phenomenon, and he states that the sun's atmosphere is a thin stratum, which cuts off one-half of the heat which otherwise would reach us. Any diminution or increase in the absorption would affect us to an important extent. For example, if there were an increase of twenty-five per cent. only, it would lower the mean surface temperature of our globe by one hundred degrees Fahrenheit. The existence of living things on the earth thus appears to be dependent on the steadiness of the sun's atmosphere: let it become thicker or thinner, and we must be frozen to death or scorched to death. We know what arctic temperature is, and geologists as well as physicists are agreed that our earth has passed through at least one glacial epoch, and may we not assume that the sun's atmosphere has been the agent by which fluctuations of temperature were brought about in the past, and that similar fluctuations may await us in some far remote future? It is a subject for earnest consideration.

Professor Loomis, United States, says that the average velocity of storms on the Atlantic Ocean is nineteen miles an hour; but that over the American continent the rate is twenty-six miles an hour. He has in the ten years 1864-74 traced ten storms all across the Atlantic from America to Europe, and he believes there would be more if the means of tracing were more complete than they are at present. The average path of the storms in crossing from west to east has a tendency to bend northwards.

In the Report of the Geological Survey of North Carolina, published by authority of the legislature of that state, a fresh instance is given of the influence of the rotation of the earth on geology. The fact is brought out that on the *south* side of certain rivers there are usually bluffs and high banks, and on the *north*, swamps and low flats; and that the

miocene shell-beds are found only on the south side. The cause of these phenomena, says Mr Kerr, author of the Report, is doubtless the rotation of the earth co-acting with the river-current; and he brings forward the demonstration that 'in whatever direction a body moves on the surface of the earth, there is a force arising from the earth's rotation which deflects it to the right in the northern hemisphere, and to the left in the southern.'

The inhabitants of some parts of our eastern coasts know well what is meant by drifting sands. The coasts of the Mediterranean furnish examples on a prodigious scale, and it appears that the city of Beyrout is in danger of being swallowed up by drifting sands. A remedy is wanted, and General Cotton has drawn up *Notes on the Works of Sowing and Consolidation of the Dunes or Coast Sand-hills of Gascony*, and these having been published by the Royal Agricultural Society, are at the service of all enterprising land-reclaimers. The Gascony sands stretched 120 miles along the shores of the gulf from the Garonne to the Adour, with a width of three miles, and were always advancing towards the interior. The work of fixing was commenced about thirty years ago by sowing pine-seeds mixed with seeds of the broom plant. The places sown were covered with brushwood, which was taken away when the broom grew strong. The broom protected the young pines till they also grew strong, and then were cut and used as brushwood to protect other plots. The pine is a sea-pine well adapted to the climate, yielding large quantities of resin as well as timber; and by steady perseverance in the way here briefly sketched, there are now two hundred thousand acres of magnificent forest, which, in a few years, will be worth more than three millions sterling. The cost was forty-seven shillings an acre; and for this moderate sum a wild desert has been converted into fruitfulness, all danger of drifting sands is at an end, and the lands behind the belt of forest are protected from the furious gales that blow from the sea. Similar endeavours on the opposite side of the Mediterranean should produce similar results.

In a communication to the Philosophical Society of Liverpool, further evidence of change of climate through destruction of trees and other causes, is presented, and the existence of the great desert of Atacama may be adduced in its support. 'The Andes thereabout,' remarks the writer, 'appear to have risen considerably during the last few centuries, and, of course, every foot of extra height decreases the moisture of the winds from the east. Then, again, the Chilians have burned every tree and bush in the mines, and so altered the scanty rainfall to nearly nothing. . . . When Pedro de Valdivia marched from Peru to Chili, in 1540, he found this region well populated, and had to fight hard in order to pass to the south. Now, no people could grow enough to eat, from want of water.'

Professor Koch of Berlin has rectified a long standing error by shewing that the two willows classed as forms of the weeping willow, are not natives of Persia or Assyria, but of China and Japan, much farther east. Popular writers have described the willows growing by the rivers of Babylon; but the willows there are not larger than shrubs; and the trees on which the harps were hung were 'most likely poplars.'

At a recent meeting of the Asiatic Society of Bengal, in Calcutta, a piece of telegraph cable was exhibited, shewing that the india-rubber covering had been pierced by grass. The piercing was so complete, and the contact of the grass with the copper core was so perfect, that 'dead earth,' as it is technically called, was produced, and the efficiency of the cable destroyed. Is this an indication that submarine cables will have to be protected from vegetable as well as animal enemies? It was suggested as a probable explanation, 'that the seeds had become attached to the core when under water, and had afterwards germinated when the core was stored.' Owing to the dried-up condition of the grass, the species could not be determined.

At a subsequent meeting, a four-horned sheep was exhibited which had been brought from Afghanistan. It is described as 'of large size and beautiful form,' with 'beautiful wool.'

India produces what may be termed wild silks, of which that made from the tussar moth is a well-known example. Measures have been taken under the sanction of the India Office for collecting these silks, working them up, and trying experiments on them with various dyes. Should the attempt succeed, a large addition would eventually be made to the commercial resources of India.

An account of a remarkable whirlwind is published in the *Proceedings* of the same Society. This whirlwind was two hundred and fifty yards in diameter, travelled a distance of two miles in less than twenty minutes, in the neighbourhood of Nagarpur. It began about an hour after sunset, in the middle of the great river Jamuná, which was an exceptional commencement, for a whirlwind usually breaks out in a sun-scorched plain in broad daylight. The river is about a mile in width. The whirlwind first struck eighteen large barges, overturned, and drove them on shore; and one was lifted bodily into the air, carried over the bank (fifteen feet in height), and dashed to pieces in a field some thirty yards inland. Next, a village was struck, and a pathway of devastation two hundred and fifty yards in width was made through it in an instant; not a house was left standing; all the plantain trees were wrenched off or uprooted; twelve large mango trees were torn up by the roots; the bamboo clumps were twisted round and laid flat, and a dead cow was found among the broken branches of a mango tree, some thirty feet above the ground. On each side of the line of havoc everything remained tranquil, and many fields over which the storm passed were entirely uninjured. After rushing through three villages, the whirl struck the river, and there ceased as suddenly as it began. The villagers, when questioned afterwards, said: 'We suddenly heard a booming, whirling sound as loud as the firing of cannon. All became dark, but with a sort of fiery glare in it; there was a sense of suffocation from the tremendous whirling of the air, and in a moment everything was swept off and whirled away in all directions.' The glare was in all probability an electrical phenomenon rendered visible by the darkness.

THE GERM THEORY.

WHEN one finds himself afflicted with an ailment which does not readily yield to the counsels of a medical attendant, he falls back on some sort of watering-place with a curative reputation—the springs of Buxton or Bath for rheumatism, and so forth. Art has failed, and, pretty much at a loss what to do, we try Nature. It is a good resolution, for, as we reason, it surely has not been for nothing that hot mineral springs have been welling up from the centre of the earth, never changing an atom of their temperature or their constituent elements since the dawn of history thousands of years back. A fair inference this. If these springs have any rational meaning, try them, by all means. Drink as many tumblers before breakfast as it is possible to swallow, and, as a forenoon's recreation, soak in baths for the benefit of the constitution. Take two months of it. That would be only giving the water a fair chance.

Such were the recommendations offered to us four years ago, when afflicted with not a very serious, though a troublesome complaint—a matter of eczema, manifesting itself by certain inflammatory symptoms on the hands. In performing a round of the German baths—hot, tepid, sulphurous, and so on—one of the local doctors (on being pressed to give his views on the subject) learnedly gave it as his deliberate opinion, that the system had been affected by germs.

'The germs! please to explain,' said we; 'what do you mean by germs?' The answer, in wonderfully good English, was as follows: 'The whole atmosphere, sir, is full of germs. They fly about everywhere. They are in clouds. We eat them, we drink them, we swallow them in every breath we draw. It is impossible to avoid taking them into our system. They are so small you cannot see them. If the body is in good health, they do no harm. They have no proper ground to fasten upon, and so they disappear. You are as well as ever. But, if there be anything bad in the system—ha! that is quite a different matter. The germs take root. They find good

places to lodge, and thrive and live upon. They make themselves comfortable in the tissues of your body, causing much irritation. You are, in fact, preyed upon by them, and that makes you ill. Their activity is shewn by an inflammation of the skin. They like to settle on any sore or feeble part of the body. There they live at their ease, give immense trouble, and sometimes make the healing of wounds very difficult. These germs are a great perplexity to doctors. Medical men are not yet thoroughly alive to their operations.'

A little startling to be told, as an explanation of a petty ailment, that you have somehow swallowed a cloud of germs, and that they are now revelling like so many demons in the palms of your hands; that being the situation in which they have preferred to take up their quarters. 'What is to be done?' we inquire; 'how is the enemy to be dislodged?'

'Ah, sir,' answered the doctor, patting one of our hands in profound admiration, as if he had lighted on a treasure, 'it is a very beautiful case. But you leave it to me. I will give you hot sulphur-baths three times a week, and also some medicines to help to kill the germs. In good time, I will make you well. I assure you, it is a pretty case, and I am pleased to shew you how it will be cured. You will go home quite recovered.'

And so, following the advice of this learned authority, we go through a course of hot sulphur-baths, and, as directed, swallow tumblers of water of a certain spring, and take the prescribed medicines. Weeks pass on, and we begin to lose patience. We allow, there was a certain improvement; but the enemy, if there was any enemy at all, was not expelled. He was only less virulent in his attacks; but whether this modification might not have been as much due to change of air and constant rambling about, as to the doctor's prescriptions, it would be difficult to say. We returned home by no means cured. Only now, at the end of four years, by prodigious care as to diet, is the ailment dying out. Whether the germs are satisfied, and preparing to take their flight, we are unable to determine. In point of

fact, we have throughout been somewhat incredulous as to these said germs. The doctor's diagnosis was very fine, but we did not quite believe in it. Without disputing the Germ theory, we thought he had not, in the present case, hit on the right explanation, and that his mode of treatment was accordingly less or more insufficient. As far as we have been able to judge, the ailment was due to some derangement of the digestive functions, and never has had anything to do with germs of one kind or other.

Far be it from us to throw discredit on the Germ theory, which is now beginning to attract attention among British physiologists, and has already been made the subject of voluminous disquisitions. All we contend for is, caution in the way of practical application. To push a theory to extremes on all occasions is only to make it ridiculous. Until we listened to the oration of the German physician, we had never given serious attention to the Germ theory. It was almost new to us, as it will be to many whom we are addressing. Having now looked into it a little, we propose to say something on the subject.

The notion that the air is full of germs of the lowest forms of animal and vegetable life—or the germs of what may be half-animal half-vegetable—was brought prominently into notice by Pasteur, an eminent French chemist, about thirteen years ago, in a work on animalcules and the process of fermentation. By means of his writings, and other works, along with discussions in various learned societies, new and interesting views of Nature were introduced; the medical world, in particular, becoming quite alive to the importance of the discoveries. It had long been known that infinitesimally small creatures soon made their appearance in certain liquids, such as infusions of sugar, when exposed to the air. But the great and difficult question was, whence did these animalcules come? More pointedly—were these creatures of spontaneous production, or did they derive their life from previous living creatures? The idea of spontaneous generation was of old date, and seems never to have been questioned till the seventeenth century. The more exact methods of observation which then began to be followed led to the abandonment of the theory by men of science, until the experiments of Bastian and others seemed to revive it. The opinion of the scientific world, as a whole, is still against the notion of spontaneous generation—that is to say, against the doctrine that life in any case can be the result of a concurrence of conditions, but springs from the germs of living creatures of a like character. Here, then, stand two classes of inquirers, as it were face to face, in distinct opposition to each other. The numerous careful experiments that the controversy has led to, have certainly widened our knowledge of the circumstances under which the lower forms of life are developed.

For convenience, we have spoken of these small demonstrations of life as animalcules. They are,

however, known by different scientific names. Two kinds are almost universal in certain solutions. They are minute, transparent, oval bodies, slightly enlarged at each end, called *bacteria*; and very small rods, generally of two joints, called *vibriones*, from having a peculiar vibratile motion. However originating, these and other creatures in their germ form appear to hover about in the atmosphere. If a brilliant ray of sunlight pass through a chink, and traverse a dark room, its path is made evident as a long gray line of motes, dancing in the air. These motes settle down as dust; and if a little of this be magnified, it is found to be mainly broken particles of wool and grains of starch; but it contains germs as well; for if a little of the dust be shaken into an infusion, we have a crop both of animals and plants at once. According to this view of the matter, germs of animalcular existence abounding in the atmosphere, only need some appropriate field whereon to alight and come actively into life. Yet, it is not alleged that these small animals are a product of the atmosphere. They have possibly had their origin in the ground, or in decaying substances, and only float about in the air, like the seeds of thistle-down, till circumstances offer them the means of settling and increasing in numbers. These are points not yet clearly defined. Anyway, what a stupendous conception this, of Creative and Providential energy! The Earth enveloped in an atmospheric sea of life germs, invisible to the naked eye, designed to fulfil a beneficent purpose, and at the very least calculated to warn us of conditions detrimental to health, if not life itself!

As may be observable from newspaper reports, Professor Tyndall lately gave a series of discourses at the Royal Institution, London, on the Germ theory. His observations, which we abbreviate, afford a tolerably lucid explanation of this interesting topic. 'The basis of his experiments is that, in the course of searching for means of obtaining air free from floating motes, he found that if air is allowed to remain in a closed airtight vessel covered inside with glycerine, in the course of three or four days it deposits all its motes which adhere to the glycerine, and it thus becomes quite free from them. The test of its perfect freedom is to pass a powerful beam of light through the case, when, if any motes are still floating, they make known their presence by reflecting the light. With air thus freed from motes, Professor Tyndall has made a long series of experiments bearing on the question of spontaneous generation and on disease germs. He has placed test-tubes in cases like those referred to, and has arranged to fill the tubes with infusions containing organic matter, by means of a *pipette* so arranged that it can reach the tubes without admitting external air. The method is to allow the air to settle and purify itself, and then to pour in the infusion down the pipette. At the same time a portion of the infusion is placed in tubes exposed to the ordinary

air. The usual precautions and preparations laid down by those who believe in spontaneous generation are carefully observed. Thus, one sample of an infusion is exposed to the influence of notes, and another sample is protected from them. Over and over again with different kinds of infusions the experiments have been tried. The protected tubes shew no change, while the exposed tubes soon become putrid, and shew signs of low forms of life. In various ways, with sealed flasks, with calcined air, with filtered air, and in a vacuum, experiments all tending to the same results were exhibited.

The professor proceeded to shew how, for want of minute attention, a person is liable to be misled in accepting apparent proofs of spontaneous production; for a single drop of liquid from one of the putrefying tubes, on being transferred to the others, would set up a series of changes at once. From this, he argued that sewer-gas of itself is harmless; it is the germs 'floating in the sewer-gas' that sow disease. If there are no disease germs present, the gas does no harm. Another set of experiments on the horizontal and vertical distribution of motes led to the conclusion, that life germs float in little clouds, since an immense number of tubes exposed in different parts and at different heights in the laboratory, shewed that some were affected many days before others. Clouds of disease germs may explain a puzzle to surgeons—why a wound, going on well for a while, should suddenly, and without apparent reason, become putrid. It may be, that it is being dressed just at a time when a "germ cloud" is passing. In his concluding remarks, Professor Tyndall referred to the fact, that it has remained for modern science to discover that, more than by battle, or accident, or famine, humanity suffers from disease germs conveyed in air and water.

While our friend, the German physician, had perhaps carried his Germ theory a little too far, it will be seen from these observations of Tyndall that he was possibly right in the main. Evidently, the Germ theory is about to give a new character to medical and surgical practice. The object aimed at is to exclude the possibility of germ contagion. And that may be no easy matter, for the means of transmitting a species of germ-poisoning by clothing and otherwise are subtle beyond imagination. As is well known, there are particular cases in which a physician must change the whole of his dress, to avoid bringing the seeds of a deadly disease to his patient, and sometimes even that precaution will not suffice. Aware of the chance of injury to wounds by exposure to the atmosphere, some surgeons have begun to employ what is called the Antiseptic or anti-putrefying treatment, which consists of causing a spray of antiseptic liquid to play all around the wound during an operation, such as the amputating of a limb, or when the limb is dressed. The spray in these cases is supposed to destroy or neutralise the action of the germs that may be hovering about. This, we believe, is now a common practice at university hospitals in Germany, and it has been employed by Professor Lister with remarkable success in the Royal Infirmary at Edinburgh.

On the generally putrefactive powers of the air, along with warmth and moisture, little need be said. Every cook knows that, subject to these

conditions, meat very speedily becomes unfit for human food. The air germs have done their work. In short, air, which is so necessary to our existence, is also a destroyer. Its damaging tendencies, however, may be circumvented. By sundry devices, we can exclude it from articles of food; and as cold is an antiseptic, it is now found to be practicable to import quantities of fresh meat from the United States by simply keeping it under a stream of dry ice-cold air. A consideration of the Germ theory leads to endless suggestions regarding cleanliness in dwellings, ventilation, and other sanitary appliances. We are to keep in mind that we are environed by an invisible foe, ever ready to take advantage of any neglect on the score of health. Pure air, or air as free from destructive germs as can be procured, is now felt to be one of the first considerations in choosing a dwelling, and in getting out of the way of noxious impurities. Lately, it has been asserted that the common house-fly acts as a kind of domestic scavenger, in clearing the air of germs, but this would require to be experimentally proved, as flies are not usually esteemed to be such agreeable companions in a dwelling as to become objects of cultivation. w. c.

MY FIRST TIGER.

'JAPES, we're in luck this morning. Our little two months' holiday hasn't commenced so badly.' And as he speaks, Patsy Belton glances gleefully at a slip of paper he is jealously holding.

'My dear fellow,' I leisurely reply, 'I haven't the faintest idea to what you allude. Perhaps, if you let me know the contents of that letter, the fog might disappear. By-the-by, Patsy,' I continue, 'apropos of ideas, that is not a bad one my self-comforting butler has got hold of. He says that a suit of warm clothing is absolutely necessary in these cold regions, and that if I don't provide him with one'—

'Oh!' said my companion; 'listen to this, dated from DROOG BUNGALOW, Thursday, 7 A.M. —DEAR BELTON—Put on a pair of wings, and fly to me at once. If possible, bring with you one or two more men; and if I don't bring you and them in close proximity with a tiger, my name is not what I believe it to be—H. THOMSON.

Now, what do you think of that?' he exclaims, looking up triumphantly, and without giving me time to put my opinion into words, he springs from his chair, and the next moment is gone. Soon I hear him pouring forth numerous questions and various orders, all hurriedly spoken, and consequently, to an Indian servant, intensely bewildering. Some snatches of sentences and a few words, such as gun, cartridges, leggings, fool, not cleaned, &c., float through the chinks of the door, and reach my hearing.

'I wonder how much of all that has gone in at one ear, and *not* gone out at the other,' is my thought, and I chuckle over it. Under the soothing influence of my cigar, and a soft breath of cool air that just glides into the room, I tumble into a pleasant meditative mood, and think how delicious and enjoyable everything

is up here, after the miseries and tortures we have gone through down below.

'Down below' means the scorching plains, which Belton and I have just left for a two months' stay on the 'up here,' which means the beautiful, grand, and, once visited, never-to-be-forgotten Neilgherry Hills, where hedges are made of heliotrope, and one's abode (locally termed *bungalow*) is netted by roses. At length my musings veer round to more immediate matters, and I say half aloud: 'The house is very quiet, so Patsy can't be indoors. I suppose he has made tracks for the tiger-ground.'

'Upon my word, Japes'—a voice known to me breaks in here—'you are positively too bad. You know there is no time to be lost, and yet here you are, muttering to yourself in a cloud of smoke, instead of getting your guns ready, and your lazy person fitly harnessed.'

(I may mention here that 'Japes' is not the name my parents chose for me. It is my inharmonious nickname, the origin of which the reader shall not be troubled with.)

'What!' I exclaim, raising myself up, and looking at him in surprise; 'you surely don't want me with you? Bah!'—relapsing into my former comfortable attitude—'the idea is too ridiculous. I should only ruin all the sport. Why, man, do you know that I never in my life shot anything bigger than a pheasant?'

'Well,' he says, determinedly, 'if you don't come, then I shall stop at home also.' And forthwith he proceeds to place his gun in a corner.

'Nonsense,' I mutter.

'I tell you I shan't go without you,' says Patsy, subsiding into an arm-chair, and beginning to whistle.

'But why,' say I, still holding out, 'do you wish to have me, of all people, with you, considering that I shall of a certainty spoil the fun some way or other, and make a fool of myself, more than once, into the bargain?'

'That is just where you are wrong,' replies Patsy; 'instead of spoiling the fun, you will add to it. Besides,' he adds impatiently, 'I know perfectly well that you really would like to come; and come you must; so there's an end of the matter.' And thus it is settled.

Belton has been gone about half an hour, when I catch sight of him opening the garden-gate. He looks more radiant than he was even before, for he has in tow two more men, as eager for the coming fray as himself. They find me quite ready; so, without further delay, we make a start for that ground, where, for the first time in my life, I may in all probability be brought face to face with—a tiger.

No power of describing, either with the pen or the brush, could possibly be great enough to enable any one to give a good or just idea of the grand and imposing scenery that greets us at every step, and which our eyes feast on as we progress onward. Forests, ravines, waterfalls, lie at our feet; and there is grandeur all around. As the gusts

of wind pass over the forests, the tree tops bend before their force, and I almost fancy I am looking on a miniature ocean with its successive undulating wavelets. I am completely overcome by the picturesque; so, carried away by what I see, I stop and exclaim: 'Wait awhile. It is not often one hits upon such a scene as this. Let us take it in.'

'Posh!' is an unromantic rejoinder; 'who ever thought of taking in bits of scenery, when on the road to a tiger cover!'

'And when time is short and precious, and not a jot of it to spare!' adds another voice.

I perceive the force of these remarks; so, contenting myself with growling something, I follow on. To hold my tongue, but to keep my eyes wide open, is my mental reservation, and by so doing I hope to be able to pass muster. Having come to this understanding with myself, I jog on with less apprehension, and therefore, as is natural, with considerably more comfort. We reach the planter's (did I not say the invitation was sent by a planter?) snug-looking, but by no means palatial establishment, just as the sun begins to shew itself from out a rather dismal, gloomy-looking sky.

The planter greets us all very cordially. 'We have plenty of time in store,' he says; 'and as thirst must be upon you all after your long walk, come inside and quench it.'

I glance at Patsy with an aggrieved expression, which very plainly tells him that, in my opinion, there would have been no harm done if he had allowed me to finish my after-breakfast cigar in peace. He takes no notice of my speaking look, and says 'Thank you' in a manner as if he thought it nothing less than sacrilege to lose time, even so much as would be given to the tossing off of a glass of wine.

'We are only thirsty for blood,' he laughingly adds, at the same time, however, leading the way to where the liquor awaits us. So, with renewed strength we soon set out on the prime errand of the day.

'Who, in the name of Fortune, are all these fellows?' I exclaim, as we come to a spot where about a hundred niggers are congregated.

'Those,' answers our host, seemingly astonished at the question—'those are the beaters.'—I hear Belton laughing behind me.

'My very dear Japes, you surely did not expect the tiger to come and shake hands with us of his own accord—did you?'

'Their appearance,' reply I, smiling, and trying to speak jocularly, 'is certainly ugly enough to scare anything.'

It had been unanimously carried that everything was to be under the complete guidance of the planter. He is to choose which *sholah* (thicket) is first to be opened by the 'beaters'; in his hands is left the choice of each separate position for each individual 'gun'; in him our whole confidence is placed; and that we have put our trust in the right man we are certain.

'Before placing you,' he observes, 'shall I shew you the spot where the brute killed the bullock, and also the mark of the dragging, which is very distinct?' A general assent; whereupon he leads the way, and we all follow in Indian file. We have proceeded thus along the jungle-path for about ten minutes, when suddenly our guide halts, which necessitates our doing likewise.

'It would be better'—speaking in a very low and subdued voice—'to talk as little as possible, now and then only in a whisper, for we are approaching the ground.'

'All right!' each one answers in an undertone. Then comes an admonition chorus of 'Hush!' after which we again jog on in the same fashion, but in the most profound silence, making as little noise as possible in thrusting aside the twigs, and treading like cats. Again we are suddenly brought to a stand-still, for our guide has stopped at the margin of a small patch of grass-land, and is, with an uplifted arm, pointing towards something to which he wishes to draw our attention. Tigers were and are uppermost in my thoughts—fanciful encounters with tigers did and do run through my brain helter-skelter—in fact my whole soul is steeped in tigers, so what more natural than that I should think that at last I was face to face with one! At the planter's gesture I am at once on the alert, and bringing my gun to a more favourable position, am prepared for any emergency. My excitement thaws rather when he breathes the explanation: 'There is the place where he dragged down the carcase.'

Suppressed laughter is within hearing, and I am painfully aware that I have again made a fool of myself. The others having recovered themselves from being amused at my expense, and I having lapsed into a less warlike position, we then cross the patch of grass-land to obtain a nearer view of the spot indicated. There, plain enough, a large gap in the undergrowth is to be seen, and there, as plain, are the marks where some heavy animal has been dragged along the ground.

'I thought it was perhaps a tiger you were pointing at,' say I playfully and aloud, totally forgetting, in my sudden revulsion of feeling, the previous solemn warning we had all received.

A bomb-shell might have fallen amongst us, to judge by the expression of horror that shows itself in each countenance at my utter disregard of caution. Each forefinger of each right hand is held up at me menacingly, and each tongue hisses forth the solemn and warning 'Hush!' Four withering glances are thrown at me, and we then proceed onwards as before in the same softly treading, North American Indian sort of fashion. Patsy is just in front of me.

And now we reach the spot whence we are to be sent off, in different directions, to our 'posts.' The planter places one hand on the shoulder of No. 1, while he points with the other. We all gather round anxiously.

'There is a large stone over there—do you see it?' he whispers.

'Yes,' replies No. 1.

'That is your post. It is in a first-rate position; for if the tiger moves down the hill by that far ledge, he will, without doubt, come near enough to enable you to do good execution.'

'Good,' says No. 1, shouldering his rifle, and disappearing into the jungle.

'Yonder is yours,' says our guide, addressing the next. 'If the brute becomes alarmed by the beaters overlapping on the right, he is bound to turn; and when he does that, he will make tracks for that *sholah*, thus passing you within easy shot.' And off goes No. 2.

'And now for yours, Belton. Let me see,' medi-

tatively, and stroking his beard. 'I shall give you the position of honour, if honour is reckoned by the best chance of a bag; and in my opinion, you have got it, when I place you alongside that clump of undergrowth. The beaters will act more on the right than on the left, as a pivot, and so befriend you; besides, stationed there, you will have two *sholaks* to defend.'

Patsy's eyes beam with expectancy and delight.

It flashes across my mind that, on an occasion like the present, it would be much pleasanter for me, who know as much about tiger-shooting as an elephant of dancing a hornpipe, to accompany my brother-officer, who has had much experience in the art. The suggestion is put mildly.

'I must withhold my consent,' says our captain; 'that would be very bad management, for you would certainly quarrel somehow over the quarry; besides, there is a large *sholah* in this direction' (pointing to the left), 'which must be guarded by one gun at least.'

'Well, good-bye, Japes,' says Patsy soothingly; 'and, next to myself, best luck to you, old man.' And off he goes.

'By that small tree to the left,' says my now solitary companion, 'is the best ground for you to take up.'

'Where do you mean?' groan I mechanically.

'There,' indicating; 'look along my finger, and you will make it out at once—a small tree. There is a mound about five yards beyond it.'

I put my head close to his, and do as requested. 'All right,' I say in an attempted cheerful manner—'all right; I see it.'

'Upon my word,' he commences; then looking round mysteriously, as if to make sure no jealous ear is listening, he speaks on: 'After all, I think your position is the most likely one to see fun, for if the brute knows that far *sholah*—and I have reason to believe that he has actually been in it—he will assuredly try to reach it; and if he does, he must turn his nose straight for your tree.'

'Good gracious!' I exclaim in rather too loud a tone for the vicinity; then, rapidly recovering myself, add: 'Ah! how jolly! first-rate!' The reader can imagine the awful smile that accompanies these words. 'But,' I continue, 'as you are experienced in this sort of outing, and as I am only a beginner, would it not be better that you should take up so good a position?'

'O no,' he answers carelessly. 'I am well satisfied with the one I have left for myself, which is about a hundred yards to the other side of that small hillock to the right.'

One question has been hovering on my lips during the previous half-hour; and it is no other motive, but a laudable desire not to be foolhardy, or to court any unnecessary risk, that causes me to put that question now.

'Am I to climb into the tree, or am I to stand beside it at the bottom?'

'There is no need to climb into it,' he says, smiling as he gives his answer.

'I asked only to avoid doing wrongly,' I explain. 'Good-bye,' I add in a tone, as if we were fated never to meet again. And off I go.

As I saunter along, the reflection, that no one else was present when my last question was put, is very consoling.

No matter of how stout a heart the neophyte may be, he must, during his first venture—especially

if it smacks of excitement, on account of mishap being possible—feel far less at his ease than when usage gives him the knowledge of how much less risk there really is than his fluttered imagination entertained. The recruit who faces the enemy for the first time does not take events with the same comfortable indifference as the medal-adorned veteran. The sailor in his first storm is more apprehensive of danger than when he has ridden safely through a hundred. And in like manner I, on this occasion, do not feel that keen appreciation of the sport in hand that, no doubt, I should have felt; in short, I was then decidedly not *quite* so comfortable as I have been on similar and subsequent outings.

I am startled out of a reverie, to things around, by hearing a distant and curious muffled sound. What can it be? It is the beaters, who have gained the top of the hill, and are descending and beating towards the spot where I stand. Only a few more seconds, and it will be decided whether it is for me to have the first shot! My intense excitement overcomes everything. I am completely carried away by it. At this moment what care I if twenty tigers were to leap from the jungle! Down come the beaters, and then I know that, for the present, the tiger is free from any hurt or harm at my hands. He and I are not to meet—not just yet, at any rate. What a din! Of a certainty all the demons in Pandemonium have broken loose. Surely nothing human could be the authors of such hideous sounds! Every man of them is assisting with some sort of noise. Some yell like fiends as they beat the bushes with sticks provided for the purpose; others indulge in shrill whistling; while others, again, clash their gongs and 'tom-toms' together in a manner that fails not in doing sonorous duty: the whole forming as neat a piece of discord as one could wish—or rather not wish—to hear. In fifteen more minutes the entire thicket has been 'beaten,' and not an animal of any sort has made its appearance. The tiger is not there. The next question is, Where, then, is he? For the second time we find ourselves grouped around our captain, each one anxious for further information.

'That is unfortunate,' is his remark, referring to our non-success. 'That "beat" was the most likely one of all to find him in. The beaters did not startle a single deer, so it is evident he has been roaming there already. However, I still hope for better luck. If you will follow me, I will lead you to the next most likely spot.'

Again we move forward with that same soft, noiseless tread as before. This wariness, this attempted avoidance of being heard, lends an air of importance and solemnity to our doings. It looks like business. Presently our leader comes to a stand-still.

'This is, perhaps, about the best place from which to point out your respective posts.' He speaks in a very low, subdued voice.

We are standing on the side of a small hill. In front is another, while about fifty yards below us is an open *nullah*—the dried-up bed of a mountain-stream. The space for half a hundred yards or so up each hill-side is free from jungle, and covered only by some short grass, and again each one is shown his particular standing-ground. My post is on the side of the hill opposite. To

my front is the open unwooded nullah; to my right lies a densely wooded ravine: thus facing me from left to right there is a considerable space, open and free for a whistling well-aimed bullet to find its billet. 'Allow your quarry to have his *side* towards you before firing,' was the planter's last caution to me, 'and you will be safe from his charging you; a tiger always charges in the direction he is looking.'

I am excited, very excited; and the reason for my excitement being so intense, I cannot to this day tell. Perhaps it was an inward unaccountable feeling that something was going to happen. I grasp my rifle firmly. The beaters are much nearer now; their sounds are more distinct. Yes; and now they have reached the top of the hill on the other side of the nullah; and now they are coming down towards the hollow and towards me. Right, left, in every possible spot, I look for some sign, some warning of approach—a growl, a stir in the bush, anything. The hoped-for and long-expected sight at length greets my eyes, for there, one hundred yards to my left, out from the jungle breaks—a tiger!

Ont he saunters, twisting his tail and growling angrily. At the first sight of him up goes the gun to my shoulder, finger on the trigger; but just in time the warning voice comes back: 'Allow your quarry to have his *side* towards you before firing.' The gun drops from my shoulder, and I watch him. He reaches the bed of the stream, and there he hesitates, as if in doubt whether to seek the cover of the ravine or move straight on. The second's pause is over; then, breaking into a smart trot, he keeps along the water-course, and makes for the ravine to my right. If he keeps on as he is now going, he must pass me, broadside on, within fifty yards. On he comes, now and again turning his head, to see that none of his tormentors are near. He has not seen me yet, as I am keeping well behind the tree. He is now straight to my front, and not fifty yards distant—shall I fire? And now he passes me, I raise the gun, lean it against the tree, take a steady aim, and fire.

My shot is a telling one. The brute rolls over and over, and then lies on the grass without a move. The beaters shortly put in an appearance, and it is with great caution that we all move to where the tiger lies stretched. There is no need for caution—there is no need for my second barrel—for our enemy is perfectly dead. The same look of pride that shone in Napoleon's eyes when gazing on the victorious fields of Jena, Ansterlitz, &c. now shines in mine, as I gaze on *my* handiwork. The rifle—the weapon that did the deed—I now handle with as much affection as the owner strokes the neck of his pet—his Derby winner. I, the duffer of the whole party, had won the prize!

I receive their congratulations with 'the pride of modest worth.'

'Bravo! old man,' shouts Patsy, as he comes up; 'if you only continue as you have commenced, we may make something of you yet.—What a grand fellow!'

'Plenty fine *bagh* [tiger], sar,' chimes in one of the niggers, grinning with satisfaction from ear to ear, and looking at me with unconcealed admiration. That look of admiration, though coming from a nigger, makes me feel exultant.

Thus happened that event, that provoked in me

a hungry and earnest desire for more. And now, though years have passed, it is with pride, pleasure, and exultation that I recall that never-to-be-forgotten day which chronicles the death of my First Tiger.

'UNLUCKY' DAYS.

In a country town during our early days—which may be set down at sixty years since—there was an old gentleman who had a firm belief in lucky and unlucky days. He would only go on a journey on a Monday, and would on no account put on a new coat on a Saturday, as to do so would be very unlucky. He had likewise some whimsical superstitions about dressing himself. If he happened to draw on the stocking of his left leg before the right, disaster, as he thought, would be sure to follow. This aged personage was but a type of many others in these not greatly distant times. His notions were only a perpetuation of superstitions that prevailed in long-past ages, and of which we have a record in various historical annals.

One of the Saxon Chronicles mentions no fewer than twenty-four unlucky days in a year. Another specifies six days (January 3d, April 30th, July 1st, August 1st, October 2d, December 16th) as being bad, not only for killing man or beast, or for eating goose, but also for a child to be born; while another names particular days in the months of April and May on which we ought to be bled, if we wish to avert fever, gout, and blindness. The Red Book of the Exchequer contains part of a calendar, supposed to have been written about the times of John or Henry III., in which the favourable and unfavourable attributes of the several months, or rather days of certain months, are set down in a series of rhymed lines. There is another manuscript calendar in existence, of somewhat later date, in which thirty-two days in the year are specified, likely to be of ill-omen to those who marry, or fall ill, or commence any important undertaking, or set out on a journey. An old astrologer asserts, with that complacent positiveness which is so characteristic of these prophetic authorities, that the angel Gabriel revealed to Joseph that there are twenty-eight days in the year decidedly good for bleeding, purging, curing wounds, trading, sowing, building, travelling, and fighting battles; children born on any one of these days will never be poor; and children put to school on these days will become apt scholars.

These amusing freaks of credulity were not confined to medieval times; we trace plentiful examples of them in the days subsequent to the invention of printing. One enumeration in English of the time of Henry VIII. includes about as many unlucky days as some of the others, but is by no means similar to them in the actual days selected. Again, on the fly-leaf of an old Spanish Breviary, supposed to have belonged to one of the Redemptorist Fathers in the sixteenth century,

there is a Latin enumeration of twenty-four unlucky days in the year, distributed impartially in pairs, two to each month. We will not weary the reader with the Latin; but it may suffice to say that the 10th comes out very badly, being an unlucky day in no less than six different months; the next in unfavourable odour is the 3d; after this, the 1st and the 7th. The second half in each and all of the months is peculiarly favoured, having only one unlucky day among the whole—July 30th. Why this day is so unfavourably excepted, we are left to guess. An old English list of twenty-eight days in a year recommends them as being suitable days on which to apprentice boys to trades, and article youths to merchants, on the ground that the youngsters would by this auspicious beginning grow up to be skilful workmen and wealthy traders. Three of the months are credited with three each of these fortunate days, but poor August has only one.

Again, an old Book of Precedents, dated 1616, contains a calendar marked with no less than fifty-three days of an unlucky character: 'such days,' the record tells us, 'as the Egyptians note to be dangerous to begin or take anything in hand, or to take a journey, or any such-like thing.' Query, did the Book of Precedents, or its author, know whether the Egyptians ever adopted the Romish or European calendar? Possibly, Gipsies are meant. Just about one-seventh part of a man's life would be lost, so far as any useful pursuits are concerned, by the adoption of such a cautionary standard! There is a small manuscript in the great Paris Library, in which are enumerated, in very old French, thirty days likely to be unpropitious for certain avocations or undertakings, which are duly pointed out.

One curious example exists of the days in certain months being associated in theory with some peculiar fitness for certain proceedings. The thirty-one verses of the last chapter of the Book of Proverbs were accepted as symbolical with the thirty-one days of the (longest) month. Several verses, relating to distances and the like, were to be studied by those who travel on the corresponding days of the month; another group were supposed to be important to the workers in linen; while others contain allusions likely to affect the workers in wool. It is obvious that this kind of manipulation is very elastic in character, and could be made to fit in with almost any theory.

Particular anniversaries, one day in each year, are accounted lucky or unlucky (as the case may be), on account of certain events which occurred thereon in past times. One day in the black list is Innocents' Day, December 28th; the day on which the children in Bethlehem were massacred by order of King Herod. A disastrous day has this ever since been regarded for the beginning of any work or important enterprise. The French king Louis XI. was very sensitive on this point, disliking to consider any public question on such a day of ill omen. It was an unlucky day for marrying. The coronation of Edward IV. of England was postponed for one day, in order to avoid this anniversary. The women in some parts of Cornwall endeavour to dispense with scrubbing and scouring on this day. On the other hand, a proneness is manifested to select a particular day for commencing any important undertaking, simply

because it is the anniversary of some great event. During the Crimean war, for instance, there were many soldiers who thought it would be lucky to make one of the grand assaults on Sebastopol on the 18th of June, that being the anniversary of the battle of Waterloo—forgetting that this day would be one greatly in disfavour with our French allies.

Predicting the weather of one day from that of another is a favourite item in proverbial philosophy—such as the inference of a wet Sunday from a wet Friday; and the dictum that 'if the sun shine on Easter Day he will shine on Whitsunday.' There is another denoting the fact that when, on a particular day,

The sun hath shined,
The greater part of winter comes behind.

As may reasonably be expected, the several days of the week have been eagerly scanned to see which of them might reasonably be associated with lucky or unlucky prognostics. The seven days of the week (or rather, six of them) have their respective good and bad qualities set forth in a Northamptonshire rhymed saying, just as dogmatic in its tone of assertion as such effusions usually are:

Monday health,
Tuesday wealth,
Wednesday for good fortin',
Thursday losses,
Friday crosses,
Saturday signifies northin'.

The contempt here expressed for Saturday is somewhat amusing. The county of Devon gives a different aspect to the matter, by connecting the days of the week with the good or ill luck likely to befall children born on those days:

Monday's bairn is fair o' face;
Tuesday's bairn is full o' grace;
Wednesday's bairn 's the child o' woe;
Thursday's bairn has far to go;
Friday's bairn is loving and giving;
Saturday's bairn works hard for a living;
But the bairn that's born on Sunday
Is brisk and bonny, wise and gay.

What was the impressive incident that rendered Sunday an auspicious day to Christians, every one knows. As to Monday, the rhymed proverbs and sayings are generally favourable; but there was a medieval belief that three particular Mondays in the year are likely to be disastrous to the human family. Cain was born, and Abel slain (so runs the legend) on the first Monday in April; Sodom and Gomorrah were destroyed on the first Monday in August; Judas Iscariot was born, and Jesus Christ was betrayed on the last Monday in December. A notion prevailed two centuries or so ago that Tuesday was a bad day for the House of Tudor—Henry VIII., Edward VI., and Queen Elizabeth all having died on this particular day of the week. We must appeal to historians to give us the exact dates, and then to almanac-computers to count backwards, and see whether the three dates really fell on Tuesdays.

Of all the days in the week, Friday is that which has been most uniformly associated with particular classes of events, for the most part disastrous or unfavourable. Unlucky Friday has existed in men's minds for centuries, and still manifests considerable vitality. An ancient monk-

ish legend tells us that Adam and Eve ate the forbidden fruit on Friday, and that they both died on Friday.

The superstitions of mariners concerning Friday are very strong. The believers in the ominous theory relate a story of a ship having been laid down on a Friday, on purpose to belie the popular belief; it was launched on a Friday, placed under the command of Captain Friday, sailed on a Friday—and was never again heard of! The redoubtable Lord Cochrane, afterwards Earl of Dundonald, on one occasion sailed in the *Wellesley* from Plymouth on a Friday; he was recalled into harbour by signal from the port-admiral before he had run far. The official reason for the recall was that he might take out a mail; but the sailors clung to the theory that the port-admiral was a believer in unlucky Fridays. The same theory or adage was strongly associated in the mind of one naval officer with the ship to which he belonged; he received his appointment on a Friday, joined the ship on a Friday, sailed on a Friday, and was wrecked on a Friday. The believers in unlucky Fridays dwell emphatically on a gigantic instance in their favour. The magnificent mail-steamer *Amazon* left Southampton on a particular Friday in 1852; the emigrant ship *Birkenhead* left Portsmouth on the same day: the one was lost by burning, involving the loss of a hundred and sixty lives; the other was wrecked in a storm, when no less than four hundred and thirty persons perished. 'So you see we are right,' said the Friday theorists.

It is scarcely necessary to urge that none of these ominous conundrums will bear scrutiny. We hear only of them when the prediction comes true, not of the overwhelmingly greater number which fail. Would the foretellers of unlucky Fridays apply to Lloyd's List, classify the ships in seven groups, and place in each group all those which sailed from our ports on a particular day of the week, they would probably find that there is just about the same ratio of recorded disasters to ships which sailed on Friday as to those which commenced their voyages on Thursday, Saturday, or any other day of the week. A resolute and faithful record of facts, whether telling for or against a particular theory, is the only effectual test of it in social life as in physical science; but this kind of impartial recording is not much in favour among foretellers.

The absurdity of prognosticating the weather from the state of the atmosphere on certain days is illustrated in the superstition concerning St Swithin's day, July 15. The common belief about this momentous day is, that if it rains or is fair on that day, there will be a continuous track of wet or dry weather for forty days ensuing. There are two serious objections to the truth of this belief. The weather is not uniform on any particular day all over the globe, nor even in one country. A dull, wet day in London may be, and often is, a clear and dry day at Brighton; and so on. But there is a greatly more serious objection. The superstition about the day originated hundreds of years since—during the régime of Old Style. The introduction of New Style (in England in 1752) caused a shift of eleven days—since 1800, twelve days. Our present 15th of July, therefore, is equivalent to the 27th by Old Style. Hence, what truth can there be in the belief about St

Swithin's? The change of Style has proved a sad discomfiture to all ideas connected with particular days and seasons; and people with any sense of discretion should try to keep these facts in mind.

FALLEN FORTUNES.

CHAPTER XIII.—JENNY'S SUSPICIONS.

ALTHOUGH the affliction from which Miss Jenny Dalton suffered was not one which the visits of general practitioners (or even of physicians) could appreciably benefit, the family doctor was accustomed to call upon her daily in Cardigan Place; and even in the country, it had been some source of comfort to her mother that good Dr Curzon should 'look in' and see how matters were going on with the invalid, at least once or twice a week. He was as kind as he was clever, and his kindness, at all events, seemed to do her good. Jenny 'believed in him' implicitly, though her faith was by no means lightly won. He never indulged in the commonplaces of his craft, or prophesied smooth things to her. She might get a little better, he told her; but he never held out any expectation of her getting well, which indeed, if it had happened, would have been a miracle. To a looker-on, her condition seemed not only hopeless, but necessarily unhappy. To move with pain, and often to be unable to move, without assistance, at all; to pass bright summer days stretched upon a sofa, and to lie awake, sometimes in pain, through weary nights; to see girls of her own age busy with their mallets in the croquet-ground, or taking the wholesome kisses of the air on horseback, while she had to content herself with books or lacework: seemed a hard lot. The future, too, appeared to be more full of vain regrets and sad comparisons than the present; it was certain that she would never feel a lover's kiss or know a husband's love. The dreams and hopes of girlhood were not for her, and yet Jenny was far from being unhappy.

Her intellectual tastes were catholic, and she was an omnivorous reader; in her huge mahogany desk—she had others, of rosewood and mother-of-pearl, but this one, a gift of her old nurse, Haywood, years and years ago, was her special favourite—she kept a store of treasures hidden from every eye, the laying up of which was more delightful to her than the growth of a miser's store—precious manuscripts in a fast-flowing hand—tragedy, comedy, pastoral, pastoral-comical, scene indivisible, and poem unlimited—all the various coin that comes from the mint of the teeming brain of youth. If she could not mix with the world around her, she had a world of her own, peopled by creatures of her own invention, into which no mortal could intrude, without her leave.

When others thought her wholly wrapped up in weaving that fairy filigree of lacework which was so greatly admired and extravagantly estimated by amateurs, it was often only her fingers that were thus employed; her brain was busy with that other work, of which no one knew the secret, though perhaps one—so keen is a mother's love—had guessed at it.

Concealment is not always like the worm in the bud; in the case of the literary aspirant, it is a wholesome sign, and has a wholesome effect: the scribbler and the witting pine for fame, and the immediate fruition of their gifts, and shrink only

from the critic; but modest worth, ere its blossom blows, shrinks from the very eye of day.

If Dr Curzon had known how his patient employed herself—not only in times suitable for study, but not seldom in the weary watches of the night, he would perhaps have forbidden such employment; but as it was, being totally ignorant of the well-spring of her content and patience, Jenny was simply a physiological marvel to him, the cheerfulest caged and suffering bird he knew.

'Doctor,' said Jenny one morning, when he had concluded his professional inquiries—such as they were—and had touched in his funny way upon all his several topics—lacework, literature, Tony, and the condition of some of his own poor folks whom Jenny had privately under her wing, so far as it could shield them—'Doctor, can you keep a secret?'

'My dear,' returned he, 'I was born for that very purpose; Mumm's champagne is not so still.'

'But, dear doctor, I am in earnest. It is a serious matter, and one which, perhaps, since he himself has not spoken to you about it, I ought not to mention; but it is my belief that papa is ill.'

'Your papa ill? Well, he ought to be, no doubt, considering the rich men's feasts at which he has sat so constantly for the last twenty years; but I have very little hopes of it.'

'Hopes of it!'

'I speak as a professional man, my dear. As a friend, of course I should be sorry to see any signs of a break-up in his system; but he seems to me to be made of iron.'

'On the contrary, I am convinced that he is very unwell. He has no appetite; his spirits are forced; his manner is wholly changed. I don't think he hears what is said to him once out of three times.'

'Liver.'

'Perhaps; but, at all events, it should be looked to. He will never tell you a word about it of himself. He only believes in doctors for other people, you know.'

'That is something, however; I have met wretches who have not even that faith by proxy. Well, am I to ask your papa to be a good boy, and put out his tongue? Nothing can be done, you know, without that.'

'You can find out what is the matter, without appearing to be inquisitive, doctor, as I know very well.'

'But do you mean to say that your mother is ignorant of this indisposition—that is, supposing that there is really anything the matter?'

'No, indeed; she is quite aware of it, but has been forbidden to speak. I know her so well, and also how papa dislikes any fuss made about himself. It is making her very wretched, I can see. We go to town next week, and then he will fall into the hands of Dr Jones—if he is persuaded to consult any one—and I don't believe in Dr Jones.'

'Quite right: vote for Curzon and country air, my dear.'

'Well, at all events, papa has confidence in you, and will listen to what you say: you have tact, as I have said, and our medical friend in town has none. It will be very bad for mamma, in a few months' time, if papa was to have a bad illness.'

'So it would, no doubt. She is not one to bear much worry at any time. I mean, she would bear it—God help her!—like a hero, only it would kill her.'

'O doctor, don't say that!' cried Jenny quickly.

'Nay, my dear; don't be frightened. Even if your father had a fit of the gout, your mother would get over it, and he is not likely to have worse than gout. I was, of course, only speaking of some very serious trouble, such as, let us hope, is not likely to befall either her or hers. She takes things to heart too much, and at the same time, is inclined to keep all her miseries to herself. That is my view of her.'

'I cannot say what is *my* view, doctor, it keeps changing so. It seems to me, to-day, that I cannot love her more—that she is all perfection; but to-morrow, I shall have found out some fresh excellence in her, I know, which will lay upon her children a new debt of gratitude and affection. I have had no experience of angels, but I shall be quite content if I find heaven peopled by such folks as my mamma.'

The doctor smiled, and laid his hand upon Jenny's luxuriant tresses, in tender approval.

'And you tremble lest this mother, to whom you are so justly devoted, should be soon going to heaven, Jenny?' said he gravely. 'Am I not right?'

'Yes, doctor,' answered she in a half-choked whisper. 'Such is my selfish fear. I dread her exchanging this world for eternal happiness in the next, where, perhaps, I shall not be. O doctor, tell me truly, do you think she is going to leave us?'

'No, Jenny,' was the quick reply. 'I see no reason for any such apprehension. She is delicate, of course—almost as fragile as yourself; and she has a trial before her which I wish she could be spared; but so long as she has no anxieties—and she has none now, for you are certainly getting stronger—and can keep her heart up, she will do well enough.'

'Then, that is only another reason why papa should take care of himself, or rather be taken care of. I am, I repeat, quite confident that he requires care. That *he* should fail in spirits is a portent that it is impossible to disregard, if there were no worse symptoms.'

'But that may be from other causes than physical indisposition. He has his troubles, of course—for all his mirth and brightness—like other people; perhaps they are just now a little thicker than usual. There was that disappointment down at Bampton, for example.'

'I thought of that, of course, doctor; but I have made certain it is not Bampton. I have heard him say myself, in a manner that I am sure was genuine, that he does not regret his defeat, except, of course, for what it cost him; and the money, as I know, he made up his mind to spend.'

'Well, well, my dear, I will do my best to physic your papa, if he really needs it, in spite of himself; you shall work it up in his food for him, like the poisoners.'

But in spite of his light way of treating the affair—which was indeed natural with him—the doctor knew Jenny far too well to doubt that there was something really wrong with her father, though he was not so ready as the majority of his

calling would have been to set it down, as he had pretended to do, to 'liver.'

The fact was, that Dr Curzon—than whom a discreeter or more prudent man was not supposed, in that part of the country, to exist—had himself once lost five hundred pounds—his entire savings for many a long year—in 'a perfectly safe investment;' and knowing the strength of that sort of temptation, if he had heard that the Archbishop of Canterbury had been obliged to let Lambeth Palace for the season to some opulent Hebrew, on account of speculation in 'Turks,' he would not have been astonished. In the case of an idle and extravagant man like John Dalton, it seemed to him the most natural thing in the world that he should have 'burnt his fingers' with some attractive speculation or another, and that the loss had affected his appetite. Perhaps the good doctor was not wholly free from that sense of pleasure said to be excited by the misfortunes of our friends; but if it was so, this, in his case, solely arose from the complacent satisfaction he derived from so sharp a fellow as Dalton having fallen into the same pit as himself. He had no idea, of course, of the depth he had fallen, nor how much he had hurt himself, or there would have been no room in his kind heart for anything but the sincerest sympathy. If this was the nature of his friend's ailment, he could indeed do nothing in the way of help; so that, upon the whole, he would have compounded for him to have been menaced with a good sharp attack of gout or rheumatism, against which his professional aid might be of use. It was hardly more likely—as he was well aware—that Dalton should consult him in the one case than in the other; but as he happened to have an opportunity of being alone with him on that same afternoon, he thought he would 'just have a shot at the ducks'—a playful expression he was accustomed to apply to all experiments of an empirical nature.

'My dear Dalton,' said he, 'now we have done talking of your daughter, I should like to say one word about yourself. She has told me—quite in confidence—indeed she has told no one else, not even her mother, that you have been getting out of sorts lately.'

'What on earth makes her think that?' replied Dalton, laughing. 'I am as hard as nails, and as fresh as paint.'

'Then I am sorry I spoke,' said the doctor dryly.

'You need not be that, Curzon. Of course I shall not tell Jenny that you mentioned it.'

'I was not thinking of Jenny. I said I am sorry, because, of course, I have no right to pry into your private affairs; and since you tell me you are not ill, it is clear that you have some serious trouble. I am quite sure Jenny has made no mistake as to something being the matter.'

'Well, then, I have a trouble,' said Dalton quickly; 'and I have no objection to reveal its nature to you—provided that it goes no farther. If it was to be known, I should lose, for one thing, my self-respect.'

'I hope that is an exaggeration,' answered the other gravely. 'It is not uncommon with men to accuse themselves of having acted improperly, when they have, in fact, only made an error in judgment, that has cost them dear. Nevertheless, if you feel it a humiliation to speak of the matter, do not do so.'

Dalton smiled. 'I am grateful to you for your delicate consideration, my dear doctor; and am quite ashamed to have evoked it, by what, I fear, you will consider to be false pretences. My ailment is very slight, though I allow I have one. The fact is, I have been worried day and night for the last week by toothache. I am a shocking coward not to have it out, of course, and that is just what I don't want people to know; and that is the long and short of the whole matter.'

'Let me look at the tooth.'

'Not I,' said Dalton, stepping back with a light laugh. 'Your fingers shall not come near it. I don't doubt that you have some terrible instrument up your sleeve at this very moment. At all events, I won't trust you. I daresay a less excitable man would think nothing of it; and I could grin and bear it myself—indeed, I thought I had done so pretty well; only, it seems Jenny's eyes were too sharp for me—if I could only sleep o' nights.'

'It's so bad as that, is it?'

'It is. I have absolutely no rest. My appetite too, I daresay, seems to have fallen off, but that is because I am afraid to eat. There is no pleasure in life, while this thumping and jumping are going on in one's jaw.'

'You have the character of being a very clever fellow, Dalton.'

'Oh, never mind that,' interrupted the other; 'I may be twice as clever as Dizzy himself, but you may be sure of one thing—that I won't have it out. I have had a tooth out before; a double one, just like this. The first pull was only torture; the second, I thought was the end of the world; the third, the man broke my jaw. Of course there is such a thing as chloroform, but I have reasons for objecting to chloroform.'

'I was about to say, Dalton,' observed the doctor coolly, 'that although you were such a clever fellow, you have, in this instance, fallen into a mistake, from which your intelligence should have preserved you—the mistake of undervaluing the wits of others. I am country born and country bred, and, I have no doubt, very inferior to your London men of the world, but I am not quite such a fool as you seem to have taken me for. It would have been wiser in you—and I venture to add, more friendly—to have told me the truth about yourself, or to have told me nothing.'

'But, upon my word and honour, I have the toothache.'

'I don't doubt it; I did not pay you so bad a compliment as to suppose you capable of a downright falsehood. But when you said I will tell you what is my trouble, I expected to hear it, and not merely what is doubtless an aggravation of it; but still—'

'My dear Curzon, I scarcely know what I say,' interrupted the other gloomily; 'for Heaven's sake, bear with me, for I am sick at heart.'

'You? Of all men, I should have said you were the least likely to be that. You have a wife, of whom any man may well be proud; your children are just the brightest and the dearest—'

'Don't speak of them, Curzon; it is upon their account—God help them!—that I am so unmanned.' He pushed the still plentuous hair back from his broad forehead with both his hands, and paced the room with rapid strides. 'It is curious that you should have spoken to me this afternoon upon the

very subject that I have been wishing to speak to you for many a day. I want your advice, doctor, your best advice, upon a matter of which, as I believe, no one has as yet any suspicion. We are liable to interruption here; and if I consulted you up-stairs, it would excite remark.'

'You wish to speak with me, then, professionally?'

'Of course. How else should there be any secret about it? When am I most likely to find you at home?'

'I will make a point of being so at any time you please.'

'Let us say at noon to-morrow, then; I will take the boat over, and drop down on you over the crags. I can go that way without any one suspecting it, and be back at luncheon without being missed. Perhaps you will think of something in the meantime for my toothache—a drop or two of laudanum at bedtime, for example, will give me a night's rest.'

'I'll send my boy over with some this evening.'

'No, no; don't trouble to do that. I don't want my wife to know that I have said a word about my health, and the arrival of any bottle from your vineyard would be very suspicious. I would rather bring it back myself to-morrow.' And so the matter was arranged.

CHAPTER XIV.—ON THE BRINK.

An American philosopher has likened the position of a man 'waiting for something to turn up' to one who goes into a field, and sits with a pail between his legs, expecting that presently a cow will back up to him to be milked; and though John Dalton was unaware of the metaphor, his sensations were identical with that of the man with the pail. Indeed, they were still less sanguine, for, to his eyes, there was no cow in the field at all. He had hitherto—save with respect to the state of health of his wife and Jenny, about which he was always more or less apprehensive—been a stranger to anxiety. He had had no grounds for it in any direction. His position and income had been assured. He had not been an extravagant man, but had always lived up to his means, without saving a penny; he had never dreamt of saving. He had not laid up anything against a rainy day, because his atmosphere—like that of some tropical regions—seemed incapable of rain. And now a deluge had fallen, the unexpectedness of the catastrophe had overwhelmed him, quite as much as its magnitude. Moreover, bad as things were, it was certain that they would become worse; it was only a question of time as to its being all over with him and his. His condition was precisely that of one who stands upon a rock at present a little above the waves, but which the advancing tide is as sure to cover with eight feet of water, as is the sun to set or the moon to rise. Some men—perhaps most men—would stick to that temporary refuge, wet and shivering, to the very last, while limb after limb was being submerged; but others, though they could not swim a stroke, would 'take arms against that sea of troubles, and by opposing, end them;' would plunge in, and anticipate their doom.

To one of Dalton's sensitive and nervous organisation, suspense would perhaps in some cases have been harder to endure than the actual disaster.

suspense which could only have one end—that of hopeless ruin; and meanwhile, the ruin was always before his eyes. Already he saw his wretched store dwindling day by day till nothing was left; his delicate wife, his ailing child, suffering all the inconveniences of poverty, the hardships of want, and then the pangs of destitution. As a matter of fact, the last was out of the question, for two reasons: they would never live through the first two stages; nor would their friends, even the least genuine of them, have permitted the third. But the only alternative was the humiliation of dependence, the bitterness of beggary. And this was supposing that the three thousand pounds on which he had calculated would remain intact; that there would be no further liabilities for the *Lara* mine than the shares in full. He fed upon these miserable thoughts both night and day, and upon the top of it all was the necessity of appearing calm and free from care—nay, of even keeping up his character for high spirits. A duller man would have taken matters more quietly; a wiser man would have called in some philosophy to his aid, and would certainly not have abandoned hope; but with this man—with his light ways and undisciplined mind—it was as though a butterfly had been caught in the frozen palms of Winter. It was not to be wondered at, under the circumstances, that life was growing intolerable to John Dalton. There had been rain for a day or two which had swollen the *Nathay* to unusual dimensions, and Uncle George proposed at breakfast one morning that they should take the steam-yacht up to the mere; a suggestion that met with great applause from the young people. It was the first time that the voyage had been practicable since the Daltons had come to Riverside, so that to Kate and Jenny, and Tony, it had all the charm of novelty. Indeed, the Campdens themselves had as little pleasure out of their steam-yacht—save what they might derive from the mere possession of so fine a toy—as it is possible to imagine; and even on the present occasion the water in the river was said to be falling so rapidly that it was necessary they should start at once, while there was yet enough of it to float the vessel. If they waited till the afternoon, they might reach the mere, but would scarcely get back again, was the verdict of the Admiral of the Fleet, as the chief man in charge of the boats had been called by Jenny; so that there was no choice about the matter.

‘O papa, can you really not come with us?’ exclaimed Kitty piteously.

He had already taken care to explain that he would be engaged that morning, in order to be free to keep his appointment with Dr Curzon; and the proposed expedition was welcome to him, since it would secure his departure from observation.

‘No, my darling; indeed, I cannot,’ said he.

‘But your company is half the battle,’ observed Mrs Campden graciously.

‘Nay; you will have no battle at all without me,’ replied he, in laughing allusion to his frequent combats with his hostess.

‘I mean, sir, that we shall never get on without you.’

‘But, my dear madam, you never get on *with* me.’

It is impossible to describe in words the air and manner which made Dalton’s speeches void of offence; but even his enemies allowed that he had an ‘agreeable insolence,’ which it was very diffi-

cult to resent without being put entirely in the wrong. If he had made up his mind not to do a thing, it was known for certain by those who knew him—though he never gave a flat refusal—that he would not do it; and his hostess made no further effort to persuade him to join the water-party.

He retired to the library after breakfast, in accordance with his pretence of writing letters of business; but he had, in fact, no business now, while of writing letters he had had of late more than enough. He was indeed only waiting until the others should be off and the coast clear for him to start upon his visit to the doctor. Now he would pace the room with impatient strides, and now—when a footstep came near the door—would seat himself quickly at his desk with the paper and pen before him; and now he would start up again and resume his walk; and now would aimlessly take down from the well-lined walls a book, and read a few lines, then put the volume back mechanically, like one in a dream. He felt that he was losing his volition; that except for that certain line of conduct which he had marked out for himself, and which, since yesterday, was ever present to his mind, he had no adaptability, nor force, nor will. Everything else was outside of him, as it were, and possessed no interest for him. It had been with the utmost difficulty, when, at breakfast-time, his host had asked his opinion concerning some cabinet question treated of in the newspaper, that he could gather his wits together to express his views. The difference between Whig and Tory had become even less to him than that between Tweedle-dum and Tweedle-dee. He was above all things, in his political feelings, an Englishman, and yet he felt that if news had come that morning that his country was at war, it would not have quickened his pulses by a single beat. Only one thing gained his attention for a moment: a volume of the *Annual Register* had been one of those which he took up, and in it his eye chanced to light upon a strange tragedy that had, years ago, taken place in France; it was the story of a hump-backed boy—a mere child—who had lost his parents, and been left dependent upon an uncle for subsistence. This man had worked him like a slave, yet was always beating and ill-treating him; and when the poor child was away from his wretched home, the boys in the street would jeer at him, because of his defect in shape. At last, wearied out by toil and ill-usage, and the universal contempt, the humpback had ended his misery by hanging himself in a wood near Paris. At the bottom of the tree was found a scrap of paper with these words upon it, ‘I have had enough of it,’ signed with the little fellow’s name.

The whole story was contained in a paragraph, but it was the tragedy of a human life. Under other circumstances, Dalton would have given a sigh of sympathy for the victim, uttered a curse against his persecutor, and have forgotten the wretched tale as soon as possible. But now it clung to him like a very shirt of Nessus, and filled him with poisonous thoughts. Here was a child, sent into the world deformed, to be tortured in body and mind until he was driven to put an end to himself. Where was justice? Where was mercy? Where was Providence? Some persons in Dalton’s case would perhaps have comforted themselves with the reflection, that however unpleasantly their lives in life had fallen, they were, at all events, far preferable

to those of the poor hunchback ; they would have extracted consolation from the fact, that they had deserved worse things than this unhappy child, yet had experienced better, and would perhaps even have felt gratitude on that account. But Dalton took up the cudgels against Fate itself, upon the child's account, almost unaware that he was moved to do so by his own consciousness of wrongs ; indeed, to do him justice, he had not himself, but only his belongings, in view. He was ready to own that he deserved considerable punishment—not perhaps quite so severe as had befallen him, but punishment within reasonable limits—but as respected his wife and children, he was very bitter and rebellious. 'They have done no hurt, and yet they are doomed to misery ; and though I have sinned, I have not sinned so deeply as to deserve that I, who love them so, should have been the cause of their ruin.'

'It was a wretched ill-governed world in which such things were possible,' was the reflection that he made to himself, though he would not perhaps have ventured to say as much. He kept on repeating to himself the last words of the poor hunchback : 'I have had enough of it—I have had enough of it—I have had enough of it !' not consecutively, but from time to time, and after intervals of gloomy thought. Presently, the noises that betokened the departure of a party of pleasure were heard in the hall without ; the chatter of female voices, and the ripple of laughter, the opening and shutting of doors, and the eager cries of Tony. 'Then a light footstep in the passage, and a gentle knock at the door.

'Well, my darling, we are going. I thought it right to go, lest the girls should think something was amiss.'

His wife was looking very pale, but the smile on her sweet face was as bright as ever. It was put on for him, he knew, and had cost her not a little.

'How brave and good you are, Edith !'

'Don't, don't talk like that, John, or I shall utterly break down,' replied she earnestly. 'You will be at home when we come back, dear ?'

'Yes, dear, yes. Perhaps I may come up to the mere from Bleabarrow way, when I have written my letters.'

She knew that he had no letters to write, at least of any consequence, and had but little hope of his coming up to the mere. Yet she answered : 'Oh, that will be so nice, and be such a pleasant surprise to the children ! Good-bye, my darling.'

'Good-bye.' They kissed one another, as though they had been young lovers parting for the first time ; indeed, they had never loved one another more than since these evil days had come upon them.

Then she went out, throwing back a look of loving farewell—to play her part in the gay picnic ; for into such the excursion had resolved itself—while he was left a far easier task—to bear the importunate Care alone. He sat down with his head between his hands, as though, with that faithful partner, Hope itself had fled. It is no exaggeration to say that he looked older by some years in those few moments ; for the sense of irremediable loss—of separation for ever—was heavy upon him. His step, when he rose up and crossed the hall to fetch his hat, was slow and hesitating, like the gait of an old man.

Once out of doors, however, the open air revived him ; the scent and beauty of the garden flowers, the bright sunshine, and the loveliness of the surrounding landscape, had also their effect. When Nature frowns, it is certain that our wretchedness is thereby intensified. A November evening, with thick fog abroad, has probably turned the scale, in some despairing wretch's mind, towards death, when, under brighter external influences, he would have lived on ; and Nature's smiles have life in them, even when they seem to mock our misery. Moreover, in Dalton's case, there was physical action demanded of him, which is, above all things, the foe and conqueror of despondency. Without calling for the assistance of a servant, he unfastened the smallest craft among the little flotilla in the boat-house, and rowed himself—not without the necessity of putting forth some skill and strength—across the tawny, foam-flecked river ; and if his boat had come to grief in that whirling stream, he would have fought and struggled for his life, no doubt, though existence had become so hateful to him. Then, when he landed on the other side, and had fastened his boat to shore, there were the steep crags to be climbed, the call on wind and muscle, and the air of the hill-top, crowning all.

For the moment, his eye drank in the glorious prospect at his feet, without that consciousness of misfortune which surrounded him, now, as with an atmosphere, through which all things came to his senses dealened and dull. Before him lay the long, deep valley of Sandbeck, an unsung Dove-dale, which Kitty was wont to affirm she had discovered. At all events, until the Daltons came to Riverside, there had been no great enthusiasm displayed about its beauties. It ran very steeply down from the moorland mere to the great plain of Bleabarrow, taking a sharp turn before it debouched upon it, so that the whole valley seemed complete in itself, and shut out from the external world. But for the height of its hills, and the length to which its windings extended, which made it appear even narrower than it really was, it might have been called a dell, so solitary and self-contained it was. Yet, a road which could be almost termed a highway traversed each side of the valley, crossing it near its head, where the ravine was only a narrow fissure, which a few miles on grew wide and deep, and in which an imprisoned stream ceaselessly bewailed its fate. At the bridge was the hamlet, consisting only of the little gray church and a score of scattered cottages of stone, and perched on the spurs of the hills were two or three farms. As Dalton rapidly descended, he passed by one of these homesteads, which, as it will have an interest for us hereafter, may here have its line of description. Like its neighbours, it utterly ignored landscape ; the side that looked—or would have looked, had it had windows—upon the valley, was a long barn built of stone, and lit with long slits in the masonry such as are common in old fortresses. The dwelling-house was very ancient, with a porch covered with a luxuriant creeper, that also stretched over the whole edifice, half-hiding it in tangled greenery. In front was a paved courtyard, with the barn on one side, and on the other a terraced garden of small extent, but very full of the commoner and more odorous sort of flowers. There were yew-trees in it, which

gave it a quaint rather than a funeral aspect; for the place was altogether bright and cheerful, and singularly clean. There were no stables near it—nothing but the barn and another farm-building, under which entrance was given to 'the Nook'—as the house was called—by a picturesque archway. If its builder had been a man of modern taste, many things would doubtless have been changed for the better; but taking it for what it was, a farm-house of three centuries old, it was singularly free from all that was unsightly or unsavoury. Of the beauties of Sandbeck, indeed, its indwellers could see nothing; but they had their garden, and their courtyard with its sun-dial, and even a little fountain upon the terrace—altogether a very sufficient home prospect; and they had only to pass through the archway to behold a scene that few localities could rival. The place was not now used as a farm at all, but was at present in the occupation of a wealthy yeoman, one Jonathan Landell, who had retired from business, and was well pleased to pass the evening of his days in the spot where he had made the rays to gild it.

SUSPENDED ANIMATION.

SOME curious instances have from time to time occurred of persons who for certain reasons have been able, while in perfect health, to assume a thoroughly death-like condition; submitting to the most painful tests rather than acknowledge the deception. In others, again, where vital functions have been disarranged, the apparent cessation of all the functions and evidences of life has ensued; while certain animal forms, by no means of the lowest grade, have under certain conditions become to all appearance, and even when subjected to rigid scientific scrutiny, utterly lifeless. Yet, on being placed in other and more favourable circumstances, these beings will at once return to their wonted and pristine activity; and may be subjected to these processes of seeming death and revival many times in succession. The truth of these statements may be vouched for from the fact, that no records have been more carefully noted or preserved in scientific archives than those in which the details of these anomalous aspects of life are set forth. And although, even in these latter days, the reputed wonders and impostures of 'bleeding nuns' and 'fasting girls' excite the curiosity of the masses, the present subject shews most conclusively in its reality and interest, that truth of scientific kind, even more than of ordinary nature, is more startling than the most cunningly devised fiction.

Starting with a very broad and general physiological principle, the dictum that in the midst of life we are really in death, receives practical confirmation from the consideration of the daily or hourly change in every living being. Continually, and as long as life lasts, the particles of our bodies are being disintegrated and cast off, as the result of the wear and tear of the vital machinery. The active stream of the blood circulation is ever carrying away to the lungs and other excretory organs, the useless particles it has received from

the tissues; whilst this same vital stream is as continually bringing new particles to replace the old. Thus, the body resembles a house which is being gradually taken to pieces, whilst at the same time it is being incessantly repaired. Before the attainment of adult life, indeed, the process of repair exceeds that of wear, to admit of the due growth and increase of the body taking place; but after the attainment of full growth, the wear and repair should be pretty equally balanced; whilst in old age the former process exceeds the latter, and the edifice of poor humanity at last succumbs, for want of material and energy to maintain it. Physiologically viewed, then, life is a process of burning the candle at both ends; since daily life is actually synonymous, in a sense, with daily death. These familiar facts are examples, in their way, of the remarkable revival and renewal of the living body in all its parts; and in strict truth it may be maintained, that through this renewal of all its particles, these apparently unchanged bodies of ours are in any one year composed of particles entirely different from those of the preceding year, and also from those which, in the years to come, will succeed the present elements of our frames. Strange it is to think, that despite the renewal of their parts, our features remain 'old familiar faces' still.

Turning from these more normal phases of the revival of life, we find instances in which the assumption of the aspects of death is exhibited in cases of so-called 'trance,' or catalepsy, and allied phenomena. To rightly understand what is implied by these curious states, we must bear in mind that the functions of life are divided into, firstly, the organic, and secondly, the animal or nervous functions. The former category includes such functions as digestion, circulation of the blood, breathing, and the like; whilst the animal functions include those of the nervous system, and are so named from their being found in the animal world alone. Now, in the state of trance, it is the organic functions which appear to be either wholly suspended, or at any rate to evince none of the ordinary signs of work or activity; whilst the nervous functions, implying consciousness of course, are awake and exercised, but only in a passive state. Thus, a patient in a state of trance gives no audible or visible sign of life, but remains, nevertheless, conscious of what is being enacted around him.

What, then, is this curious state of partial suspension of bodily faculties, with passive activity of the mind? What induces the state, and to what is the revival of the patient due? To these queries physiology can at present give no defined or explicit answer. All that cautious science may do, is simply to point to analogy and to allied phenomena in which the special characters of these cases seem to be more clearly manifested. Thus, the analogy of sleep and its attendant phenomena undoubtedly leads us for a certain distance on the path of investigation. Or even let us note the common phenomena of mental abstraction, when the body and mind seem entirely dissociated in their actions. The body is then seen to be carried safely on its course in walking, even amid the streets of a crowded city, whilst the mind is

pursuing some train of thought, utterly unconscious, in the ordinary sense of the word, of the movements of the body. These actions on the part of the body are purely machine-like or automatic in their character; and habit has doubtless played the chief part in so educating the physical powers to act independently of the mind. Thus, the common expression 'absence of mind' involves the consideration of a very great deal of intricate mechanism on the part of the body, and of some very inexplicable phenomena on the part of the mind. And we may consider, through analogy, the phenomena of sleep as presenting us with an advanced degree of the acquired habit of withdrawing the attention from present things and objects, and of further composing or fixing the powers of the mind—as in actual trance—in an abnormal and unusual degree.

While trance-sleep may undoubtedly, like other mental and bodily phenomena, pass through repetition into a regular habit, an analogous state may be artificially induced, as exemplified in the phenomena of *mesmerism*. Without doubt, physiology recognises that—under whatever name the process may be known or mystified—the mind may through some process be made to think and act automatically, or may be thrown into a state of sleep, from which it may be revived or awakened at will. In these latter cases, there is the same implied principle of a voluntary or involuntary cessation of the bodily functions, and of the temporary dissociation of the mind from the body—although the explanation of the exact *modus operandi* in such cases, lies hidden as yet from the most advanced science.

Many of the lower animals, as every one knows, hibernate or sleep throughout the months of winter; repairing to their haunts at the close of autumn fat and well-fed, and reappearing in the following spring lean and meagre. That animals of high organisation, accustomed to active life and habits during three-fourths of the year, should pass the remaining fourth in a state of torpor, in the condition of profound sleep, and without eating or evincing motion, should constitute facts of some value in their bearing on the questions before us. The body in such animals literally feeds upon itself, consuming during the long sleep the stores of matter which the nutrition of summer has laid up within the tissues. And so far, this process of hibernation, and the revival of the beings which exhibit and undergo that process, bear a close analogy to certain still more curious states in man, to which we will now refer.

The Fakirs of India have long been known to voluntarily induce in themselves a state analogous to that of hibernation in the lower animals. Thus, a case is recorded and authenticated by government officials, in which a Fakir allowed himself to be buried alive in an underground cell for six weeks, and came out alive and well from his interment. In a second case, another Fakir was immured for ten days in a grave lined with masonry, the grave being strictly guarded during that period, to insure against the possibility of imposture. And a third instance presents authenticated details in which, under the superintendence of a British officer, a Fakir was buried for three days—the original offer having been, to allow himself to be interred for nine days; but the official, fearing a fatal result and consequent

censure, caused him to be released at the third day. On being disinterred, these men present a corpse-like aspect; in the heart and blood-vessels, no pulsations can be detected; breathing has ceased, and the entire surface of the body is cold. By means of warmth and friction, however, the physical powers are soon restored.

It may be urged that some deception or fraud may be practised in these cases; the well-known expertness of Hindu jugglers rendering this supposition somewhat feasible. But we may, without hesitation, pronounce against the idea of fraud, since such phenomena are by no means confined to these Indian devotees, or to Asia alone. Thus, we find such states to have been assumed by persons who could have no motive for the practice of deception, and to whom the *rationality* of their curious powers was as much a mystery as to the surrounding observers. Many cases are recorded in medical reports of seeming death, in which preparations have been fully made for interment; the supposed corpse slowly recovering its vital powers, to the astonishment of the bystanders; whilst instances are, unfortunately, not wanting also to shew that the revival of such patients has taken place too late, and when a living body in its death-like sleep has been actually committed to the tomb. The feeling of horror at the idea of living burial, indeed, is simply the widespread recognition of the possibility of this state of apparent death occurring; and the precautions taken in some mortuaries, of attaching to the bodies bell-pulls which cause bells to ring on the slightest touch, form additional proofs of these curious phenomena being noted, and of their danger being fully appreciated.

But a still more remarkable development of these phenomena may be found in the *voluntary* assumption of this death-like state by some individuals. The well-known case of Colonel Townshend, recorded by an old physician, Dr George Cheyne, in his work entitled *The English Malady, or a Treatise of Nervous Diseases of all Kinds* (London, 1733), exemplifies this latter feature. Colonel Townshend having suffered for many years from a distressing internal complaint, came, Dr Cheyne tells us, 'from Bristol to Bath in a litter, in autumn, and lay at the *Bell Inn*.' He was there attended by a Dr Raynard, by Mr Skrine (an apothecary), and by Dr Cheyne himself. The colonel sent for all three one morning; the physicians, on their arrival, finding 'his senses clear, and his mind calm,' whilst 'his nurse and several servants were about him.' He had further, the doctor takes care to inform us, 'made his will, and settled his affairs.' But the colonel had sent for his medical attendants that they might 'give him some account of an odd sensation, he had for some time observed and felt in himself; which was, that composing himself, he could die or expire when he pleased; and yet, by an effort, or somehow, he could come to life again: which, it seems, he had sometimes tried before he had sent for us. We heard this,' continues Dr Cheyne, 'with surprise; but as it was not to be accounted for from now common principles, we could hardly believe the fact as he related it, much less give any account of it.' The colonel then offered to make the experiment before the doctors; they, with a proper feeling for the welfare of their patient, at first protesting against the proceeding. At length they

were forced to comply, and the proceedings commenced by all three feeling the pulse of the patient. The pulse 'was distinct,' says Cheyne, 'though small and thready [*sic*]; and his heart had its usual beating. He composed himself on his back, and lay in a still posture some time; while I held his right hand, Dr Baynard laid his hand on his (Colonel Townshend's) heart, and Mr Skrine held a clean looking-glass to his mouth. I found his pulse sink gradually, till at last I could not feel any, by the most exact and nice touch. Dr Baynard could not feel the least motion in his heart, nor Mr Skrine the least soil of breath on the bright mirror he held to his mouth; then each of us by turns examined his arm, heart, and breath, but could not by the nicest scrutiny discover the least symptom of life in him.' The medical men then 'reasoned' about the state before them, and after half-an-hour's pause, the colonel lying in the same motionless state, they were 'just ready to leave him' for dead, when 'some motion about the body' was observed. Then the pulse and heart gradually began to beat, and their patient slowly returned to consciousness.

But a curious fact remains to be told. The colonel called that same day for his attorney, added a codicil to his will, and, after receiving the sacrament, expired, really and truly, about five or six o'clock on the same evening. A post-mortem examination of his body revealed a healthy frame, with the exception of a lesion of the right kidney -- for the relief of which, indeed, he had come to Bath. Dr Cheyne's closing words form the most fitting conclusion, with which we may leave the case in our readers' hands. 'I have narrated the facts,' says the doctor, 'as I saw and observed them deliberately and distinctly, and shall leave to the philosophic reader to make what inferences he thinks fit; the truth of the material circumstances I will warrant.'

Lastly, we may remark, that amongst certain lower forms of animal life, the same phenomena of 'dormant vitality' and remarkable revivals are also to be witnessed. Thus, the minute *Rotifera*, or 'wheel-animalcules,' are common tenants of our pools and ditches. They are creatures of complicated organisation, possessing systems of organs, muscles, organs of sense, and, in short, are fully equipped with delicate vital apparatus. Yet these beings, all organised and active as they are, may be dried up either artificially and experimentally, or naturally by the heat of the summer sun; and in their mummified state may be blown far and wide, like mere dust-specks by the winds. Thus they may continue indefinitely; but, on the addition of moisture -- as in the case of 'germs,' alluded to in another article -- they resume all their former activity and life. They may even be desiccated and revived several times in succession. These last examples present us, therefore, with a very wonderful instance of revival after conditions which, to the majority of animals, would prove of unquestionably fatal nature. And the fact of their high and delicate organisation, presents not the least puzzling feature in connection with the question of the means whereby they are enabled thus literally to set death at defiance. The seeds of plants with less complicated organisation may also retain their vitality for very long periods; the plant, like the animal, being revived by its being subjected to the normal and natural conditions of its existence.

MY LITTLE PRIMROSE FLOWER.

[From a volume designated *The Captive Chief, and other Poems*, by James Thomson, a working-man at Shawdon, Northumberland.]

THERE grows a golden primrose
In a lone mossy dell,
The place where grows my primrose
I'll not to any tell;
Beneath the shelter of an oak,
That's wrinkled gray with age,
My pet flower blossoms sweetly there,
Safe from the tempest's rage.

A little rill that trickles by
Makes music to my flower,
And wafts itself in dewy spray
To cool its mossy bower.
The speckled trout leap up with joy
When bright it shines and clear,
And April brings its gentle rain
My little flower to cheer.

Spring wakens Nature from her sleep,
There little birds do sing,
To see the trees put forth their buds,
And flowers begin to spring.
The robin makes his cosy nest
Beside my little flower,
And close beneath its shelt'ring leaves
His little brood does cower.

When in the west the evening star
Shines like a diamond bright,
The feathered choir in brake and brier
Sing sweet their last good-night;
And ere the morning star has sunk
Behind the Cheviots gray,
They sing to my flower in its mossy bower
Their hymn to the coming day.

At morning dawn a sunbeam steals
Where my pet flower is laid,
And wakes it with a warm soft kiss
Upon its golden head.
My virgin flower, like maiden pure,
Lifts its head to the azure sky,
And wafts perfume from its golden bloom
On the breeze that passes by.

Then come the bees through budding trees,
With a hum of joy they sing
To the flower of my little primrose,
The queen of early spring;
From its cup of gold they sip
The honey sweet and clear,
And carry home with joyous song
The first-fruits of the year.

As 'neath this old oak-tree I sit,
I think of boyhood's day,
When, spotless as the primrose flower,
On the sunny bank I lay:
I gazed from earth to vaulted sky,
Till I seemed borne away
To a land of bliss, unlike to this,
Where flowers know no decay.

TRAVELS IN THE AIR.

THE science of ballooning has lately wrested much valuable information from the upper air. The balloon has been successfully vindicated, as a means of scientific research, from the reproach of being a mere toy which might amuse a crowd of onlookers. Like many more scientific toys it owed its origin to a love of the marvellous; but it has now outgrown its childhood, and become of importance to mankind. Besides ministering to the pleasures of holiday folks, and aiding philosophers in aerial researches, balloons have, since the German siege of Paris, played some part in the appliances of war. Sixty-two balloons, freighted with different aéronauts, letters, despatches, and pigeons (to bring return messages), left Paris with varying fortune during that period; while the Post-office department alone sent out fifty-four, which carried about two million five hundred thousand letters, representing a total weight of nearly ten tons. Amongst the stores of our own Woolwich Arsenal has long been seen a shell of curious construction, invented by Captain Boxer, which, on being fired, opens into a parachute bearing a strong light. This is intended to be fired at night over a besieged fortress or storming-party, to give the assailants information of the state of affairs within the walls. Every now and then, too, experiments are made by a committee at Woolwich upon various balloons, in order to discover their practicability as military engines for surveying and the like.

We prefer, however, to direct the reader's attention to more peaceful aspects of ballooning, and to the victories of science in the upper regions of the atmosphere, taking as our guide the beautifully illustrated volume of aerial travels, entitled *Travels in the Air*, by James Glaisher, F.R.S.; Camille Flammarion; W. de Fonvielle; and Gaston Tissandier (Bentley and Son. London: 1871). Besides their scientific results, the ascents of these intrepid aéronauts possess an element of the marvellous, not merely in their hairbreadth escapes, but still more from the height to which they rose. Gay-Lussac had ascended some twenty-three thousand feet (more

than four miles) in 1804; but in 1862, Mr Glaisher rose to the unprecedented height of fully seven miles. It is true that both he and Mr Coxwell, his companion, nearly atoned for their temerity by their lives. At twenty-nine thousand feet from the earth, he found his arms suddenly become powerless, followed by a loss of all muscular power, and a total inability to speak. Seven minutes of total insensibility ensued, during which his head lay on the edge of the car. Mr Coxwell's plight was little less serious. He found it necessary to clamber into the ring to disentangle the valve-rope, but felt it piercingly cold, with hoar-frost round the neck of the balloon; while, on attempting to return, his hands were frozen. Placing his arms, therefore, on the ring, he dropped down, and perceiving that Mr Glaisher lay insensible against the side of the car, he attempted to help him, but could not; and feeling insensibility creeping over himself too, 'became anxious to open the valve. But, in consequence of having lost the use of his hands, he could not do this; ultimately he succeeded, by seizing the cord with his teeth, and dipping his head two or three times, until the balloon took a decided turn downward.' During a very rapid descent, the intrepid aéronauts recovered, and afterwards landed without any difficulty. On another occasion, lovers of exciting narratives will be gratified by a race the travellers engaged in to descend from a great altitude before the currents drifted them out to sea as they were nearing Beachy Head, on the coast of Sussex. Fortunately, they were just able to alight near Newhaven, very close to the sea, but still in safety. Such are samples of what may be termed the adventurous spirit of Mr Glaisher's ascents, which, though interesting to those who take pleasure in deeds of daring, are in no way connected with benefit to mankind.

Fortunately, however, Mr Glaisher was a man well calculated to turn his aerial voyagings to account for the benefit of science, a fact which was recognised by the Committee of the British Association, who appointed him to superintend the scientific aspect of these ascents. They charged

him to devote particular attention to determining the temperature of the air and its hygrometrical states at different elevations; to ascertain the rate of decrease of temperature with increase of elevation; and to investigate the distribution of water in vapours; together with the phenomena of acoustics, electricity, and other atmospheric conditions. By abundant diagrams and wood-cuts, many of the most curious results of these travels in the air are presented to the reader by Mr Glaisher. Science has established laws with regard to the increase of heat for every hundred feet of descent into the earth, and discovers a lowering of temperature of one degree for every increase of elevation of three hundred feet on mountain-sides: how far did this last law obtain in the higher regions of the atmosphere? This was Mr Glaisher's chief problem. He found that the decrease of temperature, with height, was by no means regular or constant. In more or less cloudy states of the sky, the currents of the upper air, and the alternations of day and night, cause considerable diversities of temperature, which disturb the action of any general law at present known to us. Thus, on January 12, 1864, the temperature of the air before starting was $41\frac{1}{2}$ degrees; it decreased very slowly till 1300 feet was reached, when a warm current was met; and at 3000 feet the temperature was 45 degrees, being three and a half degrees warmer than on the ground; and for the next 3000 feet the temperature was higher than on the earth. It then gradually fell to 11 degrees at 11,500 feet, and remained at that point until 12,000 feet was gained. It is worth noticing that a warm current of air of more than 3000 feet in depth was met with in these upper regions moving from the south-west—that is, in the direction of the Gulf Stream. This helps us to understand why England possesses a winter temperature so much higher than is due to our northern latitudes—namely, the joint influence of these warmer influences, the water and the air, on our soil.

These remarks may suffice to illustrate the character of the numberless scientific investigations which have been carried out in balloons for the benefit of the scientific world. With the reader's consent, we will now secure a guide, and beg him to accompany us up in a balloon, for the purpose of making observations for himself. We hope to have a safe and pleasant journey, and a little pleasant chat as we go.

Behold, then, our pear-shaped *aërostat*, a graceful, vigorous giant, tugging at its fastenings near the gasometer, and longing to soar into space. Like the genius of Arabian story, which diffused himself abroad from the confined sides of the vase opened by the trembling fisherman, what was lately a heap of varnished calico, American cloth, or, it may be, if expense is little object, silk, has expanded into its present huge dimensions under the influence of coal-gas. The use of this inflating power was first recognised by the late Mr Green,

who made more than six thousand aerial trips; and it has since superseded the use of hydrogen gas. Our balloon has thus been filled in a few hours, instead of the tedious days which it occasionally took under the old plan. The process of inflation seems to have a charm for the spectators, who have paid for admittance and are eager to see the start. The outlay is considerable, Tissandier's balloon, the 'North Pole,' costing four hundred pounds every time it was inflated. Our balloon is not indeed of the dimensions of the so-called 'Captive' balloon, which many will remember at Chelsea, whose volume was four hundred and twenty-four thousand cubic feet, and height 121 feet. About sixty thousand feet of gas will suffice for us, though the balloon in which Mr Glaisher usually ascended was ninety thousand cubic feet in capacity. Great care has been taken to render it impervious; it has been varnished with linseed oil and oxide of lead on both sides, and it may be a layer of india-rubber and lac varnish. A network of ropes surrounds it, which is firmly attached at the head to the valve. At the lower end these ropes are united to the hoop; and from this, again, twelve or sixteen much stronger ropes suspend the car. From it too hang the guide-rope and the coil containing the grapnel to be let down in descending. The valve-rope, a most important requisite, hangs down through the open neck of the balloon.

We have by this time taken our places in the car, fitted our instruments and provisions around it, and lighted the Davy safety-lamp. Farewells are quickly said, as the weather is propitious; the spring-catch is pulled; for a moment the balloon seems motionless, and then it ascends slowly and steadily. Faint and yet fainter grow the cheers of the delighted crowds; London lies mapped out before and beneath us, with the river winding like a silver ribbon into the horizon. In ten minutes we pass into a magnificent cumulus cloud, and emerge from it into clear space, a splendid deep-blue sky being overhead, lightly flecked with what astronomers call cirrus clouds, while an exceedingly beautiful mass of heaped-up cloud below us displays a variety of glorious tints and lights. The little wind which blows is drifting the balloon westward, and there is leisure to reflect upon the marvellous prospect. Towns, railroads, fields, and forests are projected below, each clear and distinct, but all set in a wondrous silence, which helps to cast its spell over the imagination. Sinking a little over a wood, the report of a double-barrelled gun floats upward through the intervening two thousand three hundred feet; as we drift over the villages, dogs bark and geese cackle; occasionally the shouts of astonished labourers reach the balloon; all rooks and other birds give us a very wide berth. Flammarion twice noticed butterflies hovering round the car, once at a height of 3281 feet. Fonvielle also saw a gossamer spider floating past on its own slender *aërostat*; but it is suggested that it might have

been drawn up to these altitudes by a current of air.

When once in the air, a balloon, beyond its own swift motion, is not buffeted by strong currents, as it travels with them. The motion even in a storm, is scarcely perceptible. Tissandier, in an ascent with the celebrated Duriof, rose at a single bound in the midst of a violent storm to the height of three thousand nine hundred feet. Sometimes, when calm near the earth, strong currents prevail above. Flammarion on one such occasion found himself carried along with greater speed the higher he rose, at a velocity of thirty-four feet per second the first hour, and thirty-nine feet the second. Great distances are thus traversed. The same aéronaut measured one hundred and twenty miles during six hours and twenty minutes without ever feeling himself in motion at all. Thirty miles an hour may be taken as an average distance, but in a wind it has risen to ninety.

But our balloon is still majestically sailing onwards: how are we to know our altitude from the earth? Nothing is easier. A small aneroid barometer hangs before us, and indicates by its increasing or decreasing readings, corresponding changes in the pressure of the atmosphere. For instance, it has fallen to 167, which shews that we are exactly three miles from the earth. As it declares unerringly also, in fog or cloud, or in a night voyage, when the aéronaut may be approaching the earth, it is indispensable to travellers in the air. The great difficulty of all aerial travelling is to guide the balloon. Tissandier discovered that the upper currents could be utilised. The different strata of these blow frequently in opposite directions; so that it will probably be found in the future more profitable to conquer nature by submitting to her, than by inventing new sails, paddles, rudders, or the like, with which to steer the balloon's course. When once the laws of these currents are detected, certainty in aerial navigation will follow as a matter of course, for nothing is easier to an aéronaut than to rise and sink at will. Thus, we throw out a few handfuls of sand in our ideal voyage, and at once the balloon rises. To descend, the valve-rope is pulled. And here the valve itself must be described. It consists of a metallic disc, strongly pressed against a hoop of wood by caoutchouc or steel springs, the aperture being made as gas-tight as possible, by what the French call 'a poultice,' or composition of suet and linseed. The rope depends from the inner side of this valve, and by opening it even for a moment, as it allows the gas to escape, a sensible descent is experienced. Every balloon takes up a large quantity of ballast. Fonvielle in the great 'North Pole' balloon had with him six hundred sacks of sand. Various causes bring down a balloon. M. Flammarion shall describe them while we are still being wafted onwards. 'A balloon descends of its own accord as soon as it has reached the point to which its ascensional force at first carries it. Although it is composed of two envelopes of silk-stuff, it is not completely impermeable; and besides this, its lower part or neck remains constantly open above our heads. When the solar warmth causes the gas to dilate, some of it escapes from below. Again, when the atmosphere cools in the evening, the *aérostat* [balloon] becomes a little heavier, and therefore descends naturally towards the earth. A clever aéronaut rarely

touches the valve-rope—except, indeed, to open this valve completely when he descends for good: he must be able to keep the balloon at one given height by means of a judicious management of his ballast; a single handful of ballast quietly let out causes a considerable rise.' Fonvielle states that even a chicken-bone flung out caused the balloon to rise from twenty to thirty yards, so delicately was it equi-poised in mid-air. Plenty of ballast is, in short, the fuel by which aerial journeys are sustained and managed.

Having now indulged the reader with an ascent, and explained the outlines of ballooning, it is time to alight; more especially as our *aérostat*, from the above-mentioned causes, has of late been gravitating downwards. The descent constitutes the great danger of an aerial trip. Here, the presence of mind and nerve of the aéronaut are most displayed. Slowly descending, we note a level expanse of fields free from wood below us, and at once a vigorous application to the valve-rope brings us to some two hundred feet above the grass. The earth seems to rush up towards us rather than we to descend. We now ease the valve-rope, and the guide-rope trailing across the field somewhat steadies us; the valve is again opened, and the grapnel dropped. It catches in a ditch, and when yet forty yards from the ground, we prepare to leap out, for so deceptive is the descent, that it seems to our inexperienced eyes but a few yards. While our guide forcibly detains us, he bides his time, and at length brings the huge machine to a stand, grapnelled to the ground. We leap out; assistance soon comes; the mighty fabric is once more emptied of its gas, and lies a flaccid mass of ropes and silk. The bubble has burst; the trip to the skies is over, the genius is again confined in his jar.

For the details of our imaginary trip, we are indebted to the different voyages of the gentlemen described in *Travels in the Air*. Of these, Mr Glaisher's ascents were most fruitful to the cause of science. M. Flammarion's are marked with much enthusiasm, and not a little information about the upper air. Tissandier and De Fonvielle's were the most adventurous. Thus, the book is full of matter for all tastes, and is a curious record of results obtained by perseverance and daring in the midst of formidable obstacles. It embraces also a great variety of topics on which we would fain dwell, did not want of space warn us to advise lovers of the marvellous to read these daring aerial travels for themselves. The chromo-lithographs and wood-cuts of cloud-scenery possess a distinct artistic and scientific value of their own. It is proverbially rash to prophesy respecting the development of discovery in scientific subjects, but a few words must be added on the future of aeronautical travelling. Man's physical construction will ever incapacitate him from flying. The fatal accident to the 'Flying Man' at Crenorne is only another proof of this axiom. But with a careful aéronaut, ascents may at any time be made without danger, in a well-found balloon. The two motions of ascent and descent are completely within his control at present. Want of power over lateral motion will, in all probability, as at present, long remain the great disadvantage of ballooning, and it seems likely that this obstacle will only be remedied by a diligent study of the laws which rule

prevailing winds. Constant currents may blow at certain regular altitudes during the different seasons. Discover these, and the problem is solved.

FALLEN FORTUNES.

CHAPTER XV.—HOW DR CURZON'S BILL WAS SETTLED.

MR JONATHAN LANDELL—or 'Old Joe,' as he was usually termed by his neighbours—had a curious passion for the collecting of books, of which he was said to possess a surprising number; but with what object this store of learning—or rather the materials for it—had been acquired was doubtful. By some it was stoutly maintained, that Old Joe had, from very small beginnings in the literary line, become one of the greatest of living scholars; while by another party it was asserted with equal confidence, that the old gentleman knew nothing of his books beyond their titles. However that might be, the Nook and its owner were each remarkable in their way; and perhaps the peculiarity of the one reacted upon the other, and enhanced the public interest in both. If presentiments could take their rise from inanimate objects—if the room where we are to breathe our last, for example, could inform us of the fact beforehand—a new interest would be added to many things; and could Dalton have foreseen the part that the Nook was eventually to fill in the drama of his future, or rather of the future of those dear to him, he would not have passed it by to-day with such scant notice. He had seen and admired it more than once; but its chief impression had been made upon him through the drawings of it in his elder daughter's sketch-book, with whom it was a great favourite, and who had taken it from every point of view. His mood of mind on this occasion, however, was not one to be readily affected by the picturesque in architecture, and he pursued his way down the valley, as though the Nook had in no way differed from its neighbours.

The house for which he was bound was nearly a mile beyond it, and removed a considerable distance from the road; yet from the road, as Dalton drew near his goal, he could hear cries, not so much of pain, as it seemed to him, but of rage and impatience, which evidently proceeded from the doctor's residence. The house was long and low, consisting indeed but of one story, and at the end at which it was approached an addition had been made for the reception of patients only, in the shape of a small surgery. The whole house, with the exception of this *annexe*, was covered with ivy, which rendered this place of torment uncompromisingly bare and conspicuous. Its windows too, in order that abundance of light might be afforded for the pursuit of science, were much larger than those of the other rooms, and as the visitor passed by, he could hardly avoid throwing a glance into this chamber of horrors, the cries from which, though fainter, still continued. He fully expected to see some poor wretch's limbs being sawn off without

the consolations of chloroform, or the application of the actual cautery to some shepherd bitten by a collie dog. His surprise, therefore, was considerable at perceiving the doctor alone in this apartment, pacing the room like a wild-cat, and emitting terrible ejaculations. His air was wild, and one of his legs was bare, the stocking being ungartered and down-at-heel, as in Hamlet's case. It was impossible—coupling his appearance with his howls—to help concluding that he was in the same mental condition as that unhappy prince; and the front-door opening to his hand, as is usual in country places, Dalton entered the house without ceremony, and at once presented himself in the surgery.

'Good gracious, doctor, what is the matter?'

'Fire, fire!' cried the unhappy medical practitioner, holding his uncovered calf with his hand, and hobbling distractedly about the room. 'I have burned myself most horribly.'

There was an odour of singed flesh in the apartment, that seemed to give corroboration to his assertion, and, so far, to attest the victim's sanity.

'But how on earth came you to burn yourself?'

'It was that old idiot Jefferson who has done it; I hope he will feel what it is himself some day; only hotter and longer.—It's getting better now. I'm really quite ashamed to have exhibited such—such excitement. I fancy I must almost have screamed aloud.'

'Well, yes, you almost did. But how on earth came you to take Jefferson's advice? I should have thought you the very last man in the country to follow out any of his old-world prescriptions.'

'His prescriptions? I should think so. He should not prescribe for my Tom-cat. But the fact is I was obliged to call him in to consultation—the old humbug!—with respect to Jonathan Landell up yonder. The man is dying—even Jefferson knew that; but just to spite me, and because he knew I had no such thing as a cupping-glass in my possession, he recommended cupping. He might as well have suggested an annulet or toad's broth. He is a medical Pagan, and believes in all the dead-and-gone Divinities of Science.'

'So I have always heard,' said Dalton consolingly. 'He goes about with a cane that has salt in the head of it, and wears a muff like Dr Ratcliffe; does he not? You have left him nobody to murder, however, in the county, as I have always been told, except a few old dowagers.'

'That is true,' said the doctor, sitting down and nursing his bare leg; 'and it is on that very account that he has revenged himself upon me in this terrible manner. "Mr Landell," he said in his pompous way, "should, in my humble opinion, be cupped. I say nothing of any short-coming in his treatment hitherto" (Hang his impudence! think of that); "but the time has now arrived for stringent measures."

"Well," said I, wishing to humour the old fool, "cupping can't hurt him anyway." (There I was wrong; it hurts abominably, that is, unless you are very clever at it. And I have never cupped a

man in my life. Nobody ever has, who is not a hundred years old.) "I will cup him, by all means."

"Do so, do so," said the old humbug, in his stately way; and off he went, drawn by those half-starved cattle of his, to prescribe some other tomfoolery to somebody else.

"It was not till he had gone that it struck me I had no cupping-glasses. One might as well be expected to have a crucible or a mud-bath ready at a moment's notice; and though I have no doubt Jefferson himself possesses the article—for his house is like an antiquarian museum in that way—I was not going to put myself under an obligation to him by borrowing it. So I wrote to such of my professional brethren as were most likely to own such an instrument, to ask the loan of it. I was obliged to explain the circumstances, lest they should think me out of my wits, so that it consumed much valuable time; and after all, only one out of ten possessed the thing I sought.

"Pray, keep it," writes he, in the letter which accompanied it, "for it is of no value, except as a relic of an exploded system. My grandfather used to say it required an education to learn the use of it." You have to keep a flame up under the glass, you see—like this—any bit of paper will do—and then, just as the flame is about to expire, you clap the thing on. Well, I had to try it upon somebody; and since I could not persuade my groom to oblige me in the matter, I tried it upon myself. The calf of the leg seemed to be a safe place for the experiment; and just as the flame was about to expire, as I thought, I applied the glass, which I am bound to say stuck on; no force on earth would have moved it; the predictions of science were so far accomplished to admiration; but the fire *had not quite gone out*. There was a living flame, sir, attached to my naked flesh, with a glass over it, as though it were some precious crocus. I had to put the strongest control upon my feelings, to avoid bellowing like a bull. The pain, my dear sir, was something quite novel in its nature; just let me try the glass on you!"

"Thank you," replied Dalton moodily, though half-amused withal; "I will take your word for it, Curzon; and I have a pain of my own, which is quite sufficient though it may not be such torture as you describe—without being experimentalised upon."

"To be sure, I forgot your toothache," answered the doctor cheerily; he had rolled back the leg of his trousers, and began to assume his professional air.

"I wish I could forget it," continued Dalton. "It tormented me all night. You said you would give me a little laudanum for it."

"Well, laudanum is a bad thing to take to—as indeed are all things to make one sleep, notwithstanding some of them have such fine names, and are so "highly recommended by the Faculty." I should suggest Eau-de-Cologne and sal-volatile in warm water to allay the pain; or—if you are really resolved not to eject so unpleasant a tenant—perhaps a little myrrh."

"Put me up what you please, but some laudanum as well, in case the milder remedies should not relieve the pain."

"Very good."

The surgery was lined with bottles, as a library is lined with books; and the doctor proceeded to

take down one or two, and pour out a little of their contents into a small phial. Dalton watched him with an air less careless than abstracted, and presently said gravely: "After all, Curzon, this is not the matter about which I have come to consult you, but something very different, and much more serious."

"All right, my good friend. I am ready to give you my best attention; but just let me premise, that patients generally—even sensible ones, like yourself—are apt to consider matters very serious, when they are not so. It is the tendency of human nature to exaggerate our physical woes."

"For instance, when you blister yourself with a bit of tinder," said Dalton, forcing a smile. "Well, well, I am quite ready to be confuted; but still I have had warnings that are not, I am sure, to be lightly regarded. What I am about to tell you is, of course, in the strictest confidence, and to be revealed to no one, not even to my wife."

"My dear Dalton, a doctor's shop is the same as the confessionnal, except that folks tell *us* a deal more than they ever tell the priest. Of course I shall be mum as a mouse. Now about these warnings. You think you have got heart-disease, of course?"

"How did you know that?" exclaimed Dalton with extreme surprise. "Do I look like a man in that way? Have you observed it for yourself of late?"

"Not a bit of it," was the doctor's cool reply. "But everybody who has "warnings" imagines them to proceed from the same cause the heart. Similarly, everybody who spits blood—as happens to about every five people out of six in the course of their lives—sets it down to lungs."

"But I am quite sure there is something wrong—and very much wrong!"

"Pardon me," interrupted the doctor; "you can't be sure! Doctors cannot always be sure—unless it is some such old fool as Dr Jefferson—and patients never. Now, please to describe your symptoms."

"Well, I have been suffering for some time."

"How long? It is above all things necessary to be explicit."

There was a pause; Dalton was searching his memory.

"About six months back I began to be affected with palpitations—an uneasy sense of movements in the heart. These have increased in frequency and violence. Of late they have given me occasionally great pain. At such times, I have felt a stupendous oppression—and even a sensation of impending death."

"Have you ever read about heart-disease in any medical work?" inquired the doctor.

Dalton hesitated. "Well, yes, I believe I have."

"So do I," answered the other coolly; "and I should have believed it, even if you had said "No." I sometimes wish that all our professional books were tabooed to the public, as the Bible used to be to laymen. They have done more harm by putting morbid fancies into people's heads, than they have done good in healing their real diseases. I would not have them chained to a church table, because all the women go there, and would be sure to read them; but I would have them written in dog-Latin, so that neither the learned nor unlearned should be able to make them out, but only doctors."

'What I have read, however, only corroborates what I have felt,' said Dalton gravely.

'No doubt, my dear sir; but it is astonishing how these things seem to suggest themselves, when they are, in fact, suggested. However, I have a little instrument here which is very truthful, and little apt even to make a mistake. "Prithee, undo this button," as Lear says. Open your waistcoat.'

Dalton did as was required, and the doctor applied his stethoscope, putting his head on one side, like a sagacious magpie, and listening attentively. Who has not at one time or another of his life been thumped about, and bidden to take deep breaths, to cough, and all the rest of it, with a human ear glued to his chest? It is even less necessary to describe than vaccination, since some people, rather than submit to the latter operation—common fate of mortals though it be—prefer to pay half-sovereign penalties and catch the small-pox.

'Have you had any anxieties of late, Dalton?'

The doctor was still engaged in thumping when he put this inquiry, so, he could not see how the other's pale face flushed.

'You need not reply to that question unless you please,' continued the investigator, 'for I have already been informed that it is so.'

'Who can have told you, since nobody knows of them but myself?' inquired Dalton quickly.

'The stethoscope. Now, you can button up your waistcoat.'

'Then, I suppose I was right in concluding that I must at least take care of myself?'

'All people who have reached middle life may say as much as that, my good sir,' returned the doctor quietly.

'Yes; but I am conscious that there is something amiss. Pray, do not hesitate to tell me if it be so.'

'I do not find anything organically amiss.'

'But functionally, you do?'

'I did not say so. You are getting into the medical books again.'

'Well, I will ask you one question, to which I desire to have a simple "Yes" or "No." Will you give me that plain answer?'

'I shall treat you as a sensible man, you may be sure. It is not always well to give a patient such an answer—in the case of women, for example; though there are some women, like your wife, who are better able to bear it than most men.'

'Then you agree with me that my case is really serious?'

'Is that the question to which you required the simple "Yes" or "No"?'

'No. I wish to know whether you are not of opinion that I am likely—— Well, I will put it less strongly. After what I have told you, and what you have discovered for yourself, would you be greatly surprised to hear of my sudden death at any moment?'

'I should not be greatly surprised.'

'Thank you. That is what I thought.'

'Most people situated as you are—with just the best wife and children in the world, so far as I have seen—would say, "That is what I feared," Mr Dalton.'

'I have thought about it too much of late to feel fear,' said Dalton gravely. 'There are some pre-

sentiments, I venture to think, that are not merely fanciful.'

'There are some indeed that work out their own fulfilment, and therefore which should not be encouraged,' put in the doctor, with still greater seriousness. 'May I ask, Mr Dalton, if your life is insured?—I have startled you, which is just what should be avoided in these cases. Pray, forgive my stupid blundering. It is insured, is it not?'

'Yes, it is insured, though only for a sum comparatively small.'

'Just so. I only asked the question because incidental circumstances so much affect these cases.—Now, you must oblige me, before you leave, by taking at least a glass of wine and a sandwich.'

'But I have only just breakfasted.'

'Yes, but you have since then had a walk over the crags. It is very necessary to one in your condition—or supposed condition, for I have by no means issued your death-warrant, remember—to give the system constant support.'

'But really?—'

'Nay; you wish to keep strong and well, I suppose; you are not enamoured of your complaint—if you have one—as some invalids are. You shall have some lunch while I eat my dinner.'

With that the doctor led the way into another room, where his simple mid-day meal was spread, which mainly consisted of a joint of cold roast-beef. The two sat down to this, and began talking of indifferent subjects—if anything in the doctor's case, who was wont to throw his whole being into every topic of discussion, could be said to be indifferent. Dalton talked but little, and ate, as it seemed, rather to occupy himself, than because he had any appetite.

'I am afraid you find this beef a little tough,' observed his host apologetically.

'Not at all,' replied the other. 'On the contrary, I thought it remarkably tender.'

'Then it seems to me, however right you may be as to your heart, my good friend, that you have rather exaggerated your toothache.'

Dalton looked up with a flash of anger, but his host appeared to be too busily engaged in mastication to observe it.

'I didn't recommend the pickles,' he went on coolly, 'because hot things, they say, are bad for a tender tooth.'

'Everything is bad for it, as it seems to me,' answered Dalton with a laugh, that only partially concealed his irritation. 'However, I have no doubt your science will effect a cure. If you will allow me, I will take that mixture home with me, by-the-bye—and likewise the laudanum.'

'By all means,' answered his host; 'I will just go and put them up for you while you take another glass of wine.'

The doctor was some time absent; yet Dalton did not take his wine, but sat with his head forward in an attitude of eager expectation, listening: the house was small, and the partitions thin, and he could hear the other moving about in the surgery, the clink of bottles, and even—as he fancied—the pouring of some liquor into a phial, as he had already seen the other pour it. But as the returning steps came along the passage, the cloud cleared off his face, and it once more wore a smile.

'My dear doctor, this is a plot: you must certainly have intended me to take more liquor than is good for me, that you have left me so long with your wine. What have you been about?'

'Nay, my dear sir, a half-starved apothecary who sells poisons must be careful of his measures. Here is the mixture and the laudanum; pray, be careful of it, for there is enough there to kill half the parish.'

'Thanks,' said Dalton, disposing the neat little parcels in his pockets. 'There is but one thing more, Curzon: it is a delicate matter; but between old friends there need be no fanciful scruples. Please to let me know what I am indebted to you?'

'What? To Robert Curzon, F.R.C.S. John Dalton, Esq., for attendance upon his wife and family. Pooh, my dear sir; that will go in at Christmas. There is nothing we doctors dislike so much as going into details; it is as bad as taxing a bill is to an attorney.'

'But I particularly wish this little matter to be separate. I would not, for example, have my wife know that I came to consult you professionally on any account, and I have other reasons for secrecy.'

'Very good. You are a rich man, or I would not take a penny. Let me see, if I were Dr Jefferson, I should call it a special appointment, and charge you two guineas, which would cover the cold beef and sherry nicely: being only a general practitioner, I don't think I can screw more than one out of you.'

'I can't imagine how you doctors manage to live,' said Dalton, producing his purse. 'You seem to me to take more pains for less money than any other class of men.'

'But this is two pounds. I am afraid the whole valley has not so much change in it as you will require.'

'But then there is the mixture, Curzon.'

'Nay; that can surely go down in the general account, my good sir. Pride is not my weakness, but I can't sell you threepennyworth of sal-volatile across my own dinner-table.'

'Why, what is the difference? I am astonished at so sensible a man being so thin-skinned. Now we are quits for to-day's business, so let us say no more about it.'

'What? Do you wish it to be understood, then, that I have sold you eighteen-shillings-and-nine-pence-worth of laudanum? Mantua's law is death to any one who sells one half of the dose. If you are really serious in wishing to keep the whole transaction private, here is the proper change. I wish it was the general custom among folks in this neighbourhood to settle with their doctor so promptly.'

The settlement was indeed ridiculous, considering the smallness of the amount, and the relations between the two men, and they both endeavoured to treat it as more or less of a joke. But as a matter of fact, the affair was very embarrassing to both parties, and much more so than if they had been dealing with any important sum. Doctor and patient were equally pleased when the interview was ended, and they took leave of one another at the front door; the former to start upon his 'rounds' on horseback, which his friend's visit had unusually delayed; and the latter to return to Riverside by the way he had come.

'I have left no footstep behind me,' muttered Dalton to himself with a sigh of satisfaction, as he

strode quickly up the valley; 'and I have persuaded Curzon to believe the thing I wished. What rubbish is all this pretence of Science, who can have a theory thus foisted upon her as easily as a conjurer forces a card upon a child!'

CURIOUS COMPANIONSHIPS.

If it be true, as the old proverb informs us, that 'Poverty makes us acquainted with strange bed-fellows,' so no less truly may it be asserted, that natural-history science exemplifies for us instances of the strangest associations and companionships among the lower animals. Nor are these associations always to be explained on the grounds of parasitism, or from other causes which zoology may plainly enough demonstrate. In cases where one animal acts the part of an unconscious or unwilling 'host' to other animals, which have taken up their abode within or upon him as 'guests,' the cause or principle of the association is quite explicable, on the ground that the parasites seek the bodies of other animals as their natural and rightful territory. And indeed, unless provided for, by gaining access to its own and generally limited territory, the parasite perishes, being literally unable to help itself.

The instances of companionship to which we specially refer, however, are very far removed in their essential features from the question of parasitism. Abundant examples, as we shall presently note, may be found, in which one animal form associates itself with another, often of widely different nature and status in the scale of being from itself. And this association is generally of the most invariable kind. The one animal being found, we may safely and surely predict the presence of the other. Such instances of invariable close companionship are very rarely to be explained on ordinary scientific grounds, and present to the naturalist puzzles of the gravest and deepest kind. In the vast majority of cases, he fails to see any apparent benefit or ail to be derived by either of the associated beings; and it is exactly this want of object, if we may so term it, which forms one of the most inexplicable aspects of such studies.

It is a remarkable fact that an absolute disinterestedness marks many such companionships, although it is sometimes hard to draw the line which shall separate pure 'parasites' from mere 'guests' and 'lodgers.' The well-known flower-like Sea-anemones, so familiar as denizens of our sea-coasts, and seen in all their natural brilliancy in the tanks of our large aquaria, present several notable examples of curious companionship. It has been noted that small fishes are frequently in the habit of swimming about *within* the mouths and stomach-sacs of large anemones, evidently on the best of terms with the latter. And this association may be shewn to be rather inexplicable, in one sense at least, if we consider that the slightest touch is usually sufficient to cause the tentacles and mouth of Sea-anemones to close upon foreign objects. Unfortunate crabs which chance in their peregrinations to stumble against a large Sea-anemone, are quickly drawn into the mouth by the tentacles and swallowed. And noting this very natural feature of anemone-character, it seems curious to think of such a dainty morsel as a fish being permitted to

swim at its ease literally within the stomach-sac, and within easy and tempting reach of the appetite of its strange neighbour.

But this very kind of association evinces further curious characteristics; for observers have noted a little fish that not only lives within the *Dahlia Wartlet* Sea-anemone, but actually permits the Anemone to contract itself, and to inclose it in its fleshy tomb without injury. Another Sea-anemone—the *Adamsia palliata*—the pretty little 'Cloak-anemone' of our English coasts, offers a most inexplicable case of companionship in its habitual association with a certain species of Hermit-crab—the *Pagurus Prideauxii*. The Hermit or Soldier Crabs are well-known dwellers on the sea-beach, and ensconce themselves in the cast-off shells of whelks and other molluscs, for the purpose of protecting their soft bodies. On the shell which protects this veritable Hermit, the Cloak-anemone may almost certainly be found; and it is to be noted that this species of crab only, and the equally definite and single species of Anemone, are the two beings which respectively form the association. The unvarying nature of the species is, in fact, as remarkable a feature in the case, as the invariable nature of the companionship. And not only does the Hermit-crab appear tacitly and simply to tolerate his living burden, with which, like Sindbad the Sailor and the Old Man of the Sea, he persistently crawls about, but he also appears to exhibit a certain care and affection for the Anemone. He has been noticed to feed the Anemone with his pincer-like claws; and when—as is the custom of these crabs—the crab casts away his shell, to seek another and larger abode, he carefully detaches the helpless Anemone from the old habitation, and assists it in gaining a firm basis and support on the new shell. Another species of Hermit similarly makes a companion of another kind of Anemone; the latter subsisting on the food-particles furnished by its host. These details may pardonably suggest to us the idea that there may be, after all, much that is identical in the psychology of even such lower forms as Hermit-crabs, with the motives and acts which we are accustomed, perhaps too exclusively, to regard as peculiar to ourselves.

The familiar little Pea-crabs, or *Pinnotheres*—so named from the small size of their bodies—present instances of a copartnership with mussels, the explanation of which is very hard indeed to find. Within the bodies of these mussels and other Molluscs, and within the folds of the structure which both lines and forms the shell, and which is appropriately named the 'mantle,' these little Pea-crabs appear to lodge in a perfectly natural and accustomed manner. So far as inherited custom and habit are concerned, the Pea-crabs may well have become accustomed to their surroundings; for we find that Pliny of old, with other ancient observers, was familiar with the fact of their unusual residence, and speculated on the causes which induced these animals to select their abodes. This old naturalist quaintly informs us that the mollusc being 'a clumsy animal without eyes' opens its shell, and thereby allows other fishes to enter. Pliny further tells us that 'the *Pinnotheres* (or Pea-crab) seeing his dwelling invaded by strangers, pinches his host, who immediately closes his shell, and kills, one after another, these presumptuous visitors, that he may eat them

at his leisure.' Thus, the Pea-crab is accredited at once with the virtue of efficient watchfulness and with the vice of jealousy; and so the case appears clear enough to this old naturalist, on the assumption that Pea-crabs and Molluscs are actuated by much the same motives as ourselves! The fact of an active little body like the crab being allowed peacefully and naturally to dwell within the delicate, and usually irritable tissues of the well-known mussel, has as yet admitted of no satisfactory explanation at the hands of modern zoologists.

The great Insect-class exemplifies many remarkable associations, most of which, however, are examples of parasitism. For instance, a curious relationship subsists between ants and certain species of beetles. Indeed, some species of beetles which are totally blind, are nowhere to be found save in the nests of certain kinds of ants. These beetles are further known to be carefully tended by the ants, who at once attack any intruder into their nests, however nearly allied the latter may be to their blind friends. This is more mysterious than the well-known friendship that exists between ants and plant-lice, since the beetles do not, so far as observation has gone, furnish any secretion to, or otherwise benefit their hosts. One species of these blind beetles (*Claviger Duvalii*) is only found within the nests of a species of ant—the *Lasius niger*. Some ant-nests of this species may, however, be destitute of these beetle-visitors; and when the latter are artificially introduced into such guestless homes, the ants at once kill them. M. Lespès, who has given us these details, thinks that the latter fact may be accounted for by the supposition, that some ant-colonies are more highly 'civilised' than others; but this explanation is more ingenious than probable or satisfactory.

Amongst Fishes, many examples of association with other fishes of widely different kinds, and for reasons not always apparent or explainable, are also to be found. The great fish frequently cast up on our shores after storms, and known as the Angler-fish or Fishing-frog (*Lophius piscatorius*), appears in many cases to give shelter, as a willing or unwilling host, to a kind of eel, which lives within the capacious gill-chambers of the Angler, and doubtless subsists on the food-particles which may find access to its abode, from the equally capacious mouth. The well-known Pilot-fish has received its name from its supposed habit of piloting sharks towards their prey; whilst, as was believed by the ancients, it also warned the sea-monster against dangers of all kinds. Of the mere fact of the companionship between sharks and the Pilot-fish, there can be no doubt; but it seems to be doubtful if the attendance is of the disinterested kind just alluded to; as the contents of the stomach of the Pilot-fish, we are told, generally consist of food which it has picked up for itself. It is therefore not a mere parasite, but may probably follow the shark from the expectation that its chances of picking up food are greatest in the neighbourhood of so powerful a caterer.

The Remora, or Sucking-fish, in virtue of possessing a peculiar sucker on the top of its head, forms associations with other fishes, probably as an aid to locomotion. Fixed to the body of another fish, this clinging companion is saved all further trouble of movement on its own account, and roams wherever its foster-friend may list.

In the class Birds, many notable examples of curious likes and dislikes of personal kind, if so we may style them, may be found. For, whilst in some cases, the friendly companionships are very evident, so no less are examples of aversions and dislikes. The cuckoos thus present us with curious instances of semi-parasitic habits, in their invasion of the nests of other birds for the purpose of depositing their eggs; and the association between the birds known as Ox-peckers (*Buphaga*) and cattle, is no less curious in its details, even if we consider that the reasons for the companionship are of very evident kind. The Ox-peckers form a group of Perching Birds, inhabiting Africa; a familiar species being the Common Ox-pecker (*Buphaga Africana*); and their popular name, together with the designation—not applied to birds alone—of Beef-eaters, has been given to them from their habits of following herds of cattle in great numbers, and of perching on the backs of their bovine neighbours, for the purpose of extracting the larvæ or caterpillar-forms of the troublesome *Bot-flies*. The eggs of these flies being deposited in the back of the ox, and usually in a part which the animal is unable to reach with his tongue, give rise to a troublesome swelling, known as 'worbles,' within which the young insects undergo part of their development. The Ox-pecker alighting on the back of the ox, soon contrives, by aid of his powerful and peculiarly shaped bill, to extract the larvæ—an operation seemingly conducted with gentleness and skill, and apparently relished, as a relief from pain, by the subject of the operation; the oxen evincing no uneasiness or objection, consequent on the attentions of these birds. In like manner, Starlings in our own country befriended sheep by ridding them of troublesome larvæ. In short, it would be difficult to find more typical cases of true co-operation for the purposes of mutual benefit, than those before us.

As an example of aversions on the part of very closely related birds, may be cited the case of the swift and chimney-swallow; these birds being rarely, if ever, seen to associate together; whilst the more positive fact of their aversion is exemplified in the instance, familiar to all ornithologists, that when these two genera of birds take up their abode in one street, the swallows will select one side, whilst the swifts retain the other. This conservatism in nest-building extends to their more active habits; for, when in flight, the two genera, so much alike in appearance and in their selection of food, appear to preserve the same air of restraint and non-companionship. And the comparative psychology of the present case is rendered all the more puzzling in its aspect, from our knowledge of the fact, that the house martin and chimney-swallow, in their earlier years at least, are close companions and friends.

Amongst higher animals than birds, instances of the preceding traits of character are by no means wanting. Thus, so far as unwonted familiarity is concerned, the expression 'cat-and-dog life' is not always synonymous with hatred and discord; but is sometimes, on the contrary, indicative of the closest and most friendly attachment. A raven and a cat have become lifelong friends; and rats and dogs, and cats and mice, have been known to lay aside their inherited differences, and to fraternise in the most amicable manner. Occasionally, we may meet with examples of aversion amongst

quadrupeds which are not readily explained; as, for instance, the commonly observed fact, that horses and cows grazing in the same field rarely fraternise; whilst cows and sheep appear to be less conservative in their habits and associations.

In zoological collections, companionships of unusual kind are not unfrequently formed; and, although such traits of character are less surprising amongst animals of high intelligence, such as monkeys, instances are not wanting to shew that, as in some human friendships, the 'contracting parties' may be of very dissimilar kind. A large and powerful monkey has thus been known to staunchly befriend and protect a weak and insignificant brother, of different species, from the attacks of the other occupants of the cage, and also to reserve the delicacies, which his superior strength could secure, for his less agile companion.

Sometimes, however, a case of apparent association may be disproved by closer scientific scrutiny. A remarkable worm-like organism had, for example, been long known to occur in invariable association with certain cuttle-fishes. These 'worms' were figured and described by various naturalists under the name *Hectocotyls*, and every one appeared to be satisfied of their parasitic nature and life. But to the astonishment of the zoological world generally, more careful observation afterwards shewed that the supposed parasite was in reality one of the modified arms or tentacles of such cuttle-fishes; the altered appendage having obvious bearings on the development of these animals.

AN OLD LOVE-STORY.

WRITTEN IN 1847.

IN THREE PARTS. —PART I.

My name is Edward Thane. My father was a small farmer in the North here; and in all the country round you could not pick a spot of colder clay than my father's farm; nor could, in all the country round, have been found a man of better heart and of simpler faith than he was. But I do believe the farm broke his good heart at the last, so cold it was and unyielding. I was a child when he died; but I remember well his hard-working faithful life, and his honest trust that I should grow to be like him, and keep the place after him, for our people had been farmers there longer than any one had account of. But his sudden death made this impossible; and so it was that I was taken to live at Swarling Mill, to be in a manner adopted by Stephen Brand, the miller, my father's best and oldest friend, and the only one I had; for of relatives I had none that I knew of. My mother I cannot remember, for she died at my birth; but her picture I have, and reverence.

Stephen Brand, the miller (or 'Old Times,' as the people of the neighbourhood called him), was a man of Anglo-Saxon mould, a man the like of whom you will seldom find in these days, even in the North, where the race of men has at all times run to strength of both mind and body. Indeed, when Uncle Stephen (as I always called him) died, many years ago, people told each other regretfully that he was certainly the last of his kind, and that his like would never again be amongst them. There was no successor to him in the village, or anywhere near it; things had come to such a pass. It was a

surprisingly modern age, they said, and everything seemed to be changing, and neither the weather nor the crops came with any regularity, as in by-gone years. It was also divinely felt that newfangled notions and strange inventions were eating into the heart of honest labour everywhere, and, as Uncle Stephen himself said, men were being turned out like machines too, and not moulded as men should be, and as they were when George III. was in his prime.

I took to my life at the mill as if I had been born to it, the same as Willy Brand, the miller's grandson. Willy was shy with me at first, and refused to play with me; and during the first day or two we watched each other's movements about the place with curious interest, mingled with a sort of shy misery, that seems to me now quite incomprehensible. But on the second or third day we grew sufficiently familiar to throw stones at each other, and so we gradually became intimate; and he shewed me all he knew, and I soon grew fond of him and the new home.

There was a general subdued excitement about the old mill that fascinated me, and held me captive by the novelty and puzzling nature of its internal parts. I have never forgotten, all my life long, the rapture with which I first listened to the mingled music of rushing water and clanging machinery; the splash, splash; the click, clack, and the mysterious rumble of it. Willy and I used to sit on the wall near the mill-stream and listen to the great rhythm by the hour; wondering greatly at the cleverness of men, and of millers in particular. Many a time did we earnestly beg of Uncle Stephen to promise that one day we should be millers too. 'It takes a man to be a miller,' he would reply gravely. This reply always made us feel our smallness more than ever. It seemed an improbable thing that we should ever rise to be men. But all the same, we resolved to be millers, and men if possible.

Swirling Mill was a queer old red-tiled house, with diamond-paned windows and pointed gables, with the timber rafters shewing through the plastered walls. Add to this the actual mill itself, standing close at the rear, and beyond that again, the thatched stables; the yard, with carts laid along, and fat-throated pigs and crazy turkey-cocks imitating their betters, and you have the dear old mill pretty much as I knew it. There was little change there. The death of Ilaco, our old mastiff, marks an era in my mind to this day, dividing two periods as much with me as Waterloo may with other people. The mill stood in a valley, and the summer view of it (it was summer when I was taken to live there) forms in my mind an ever-present and ineffaceable picture: the clustering pinewood behind it, and the rough heather-hill beyond that; the tiny brown river rushing down to the mill-pond, and then rushing out again, seemingly from the very foundations of the mill, and winding away down the meadows, where it became gentle again, and a mere trout-beck once more. But to Willy and me, who saw it tossed in foaming cascades over a mighty revolving wheel, it was never again the water of the upper stream.

Willy and I were fond of the river. We fished there, waded, bathed, and fought there. To ride the horses to it; to sit in triumph on their great quarters as they trudged to it wearily of an evening to drink, was always an event sweet to look forward

to, and sweet to remember; and the fluttered astonishment of the ducks at our random riding seemed the essence of fun. Those were happy times indeed for Willy and me; shadowless days of young summer. There was keen fresh hungry enjoyment of life always. Hunting up hens' nests, and trying to suck the eggs; or vexing the fatherly hearts of maddened ganders (puffed up with the responsibility of little yellow goslings); 'tickling' trout: my memory is full of it all even now, when the joys and sorrows of my manhood are growing dim with time. Oh, for that splendid beech, with its giant limb hanging into the mid-stream of the quiet river! To us it was not a tree at all, but a man-o'-war ship; and we were its desperate crew, Willy and I, and a tame jackdaw, looking sidelong at everything. Many a half-dozen Frenchmen each we slashed among its branches; and often we climbed to imaginary mast-heads, shouting shrill ahoy to the passers-by. Ahoy! we knew to be a suitable sea-phrase, because drunken Bill, the wooden-legged sailor of the village, came once to our church-door while prayers were going on, and shouted 'Ahoy there!' with a voice like a bull. So we grew up together, Willy and I, and loved each other, sharing everything—the sweets of idleness and the bitters of school.

But there was one thing I could never understand, and that was, the extraordinary notice old Squire Hartling and the ladies from the Hall used to take of Willy whenever we met them; and that was seldom enough, for we usually ran like hares from the presence of the gentry. We stood in much awe of them, dreading being asked our names, ages, and so forth; which kindly meant inquiries, I am sorry to confess, were generally associated with the disagreeableness of the Church Catechism, a single question from which, such as, 'What is your duty towards your neighbour?' would suffice, even at my advanced age, to fill me with melancholy, and a lurking desire to hide myself from view. But as I have said, I could never at that time make out why so much notice was taken of Willy and so much less of myself. Not that I minded that, but Willy did, for the task of talking to the great folks fell upon him with severity. He was very shy and sensitive, and on such occasions used to shrink painfully from his kindly questioners; trying to get behind me, to push me forward; whilst I was running over in my mind as much of the Ten Commandments and the 'Duty' as I could remember. But when the squire was alone, it was better, for he would often content himself with good-naturedly patting Willy on the head, and pinching my cheek. My noticeable cheeks at that time used to be a burden to me, so chubby and red were they, and so many were the unfeeling remarks made about them by my elders. But Willy was pale and delicate, with large dark eyes, that used to flash and change with his moods, like the soft eyes of a spaniel.

Willy and I had very few companions in the village. Amongst our school-fellows, Willy was shy; and I, who was so fond of him, grew insensibly to imitate him in many of his ways, as young animals do with each other. But I was never like him really, for the gentle blood that was in his veins made him sensitive to the rude life of the village boys. Many a time I have stood between him and their maliciousness, for though Willy would fight savagely, yet as soon as he saw his

own blood, he used to shiver, just like Uncle Stephen's greyhound, and lose the firmness of his hands, for his nature was as gentle as a girl's. But I was of a coarser mould, the product of a long-inherited clay-farm, and I never grew hot in a fight until my nose bled or a tooth gave way; then I always fought like a mule, with no more feeling concerning blows about the head than a cabbage.

One great and sworn friend we had, and that was Bill Stubbs the old man-of-war's-man—the drunken, jovial, brave Bill Stubbs! Bill used to sing to us, and spin us long yarns about his sea-life and the great fights he had been in with the French and the Dutch. Everybody liked Bill; but everybody also had doubts that the drinking of rum, and the abundant swearing of uncommon oaths, were not profitable to a man when his head was gray and his passions cold. But Willy and I saw nothing of this; we only saw Bill the hero, Bill the conqueror, with a wooden leg, and the heart of a child. His heart was good, we knew, for when Willy once proposed to him that he, who had killed so many, might surely kill old Snuffy Tegg, the schoolmaster, he refused, and surprised us by a lecture on our evil hearts, that we should be minded to kill an old man, who had it in him to do us good and teach us knowledge. 'No, no, lads! fair and square; no mutiny for Bill Stubbs. I tell ye, I've sailed under skipper's as 'ud make arf a dozen o' he for cantankerousness.' Still, Willy and I greatly doubted the existence of any human being capable of making himself as disagreeable as old Snuffy. But for all that, Bill would never allow us to play the truant to stay and talk with him, as many a time we would have done.

So our school-days passed on, and with heavy toil we arrived within a short time of each other at an acquaintanceship with the Rule of Three, and even to the more uncertain ground of Fractions. Snuffy Tegg thought I understood it; but I knew better, and I do not understand the Rule of Three to this day. It was from old Bill's yarns that I learned the way of putting together what I had to say in the shape of a story. Indeed, had I hearkened to old Snuffy half as much as I hearkened to Bill, I should not now be so troubled in my mind whenever I have a few figures to take account of.

The two ladies from the Hall, Squire Harding's daughters, used to come to the school and teach us grammar and catechism; and so it happened that in many minds in our neighbourhood these two subjects are hopelessly mixed to this day.

'What is grammar?' said Miss Sarah Harding to little Jack Spratt one day. Jack hesitated a little, but, speaking from conviction, answered deliberately: 'She's an old beast.' Jack, I do think, meant his grandmother. He was a starvel-looking little boy, with large ears; and old Snuffy laid hold of them and pinched them with great relish and heartiness. Poor Jack wept bitterly; and little Miss Joy, the squire's grand-daughter, came up to him and patted his wet cheeks softly, saying, in her sweet childish voice: 'Don't cry so, little boy.' Jack, in the excitement of his wonderment, took her tender hand to his mouth, holding it there for a moment, and turning his tearful eyes round upon her innocent face. But mistakes like Jack Spratt's were made often enough. Once, I remember, the question came round to Willy, 'What are the nine parts of speech?' and from

the answer he made, which included the pomps and vanities of this wicked world, it seemed he had only heard of three, and they had been renounced for him by his godfathers and godmothers at his baptism. So I have always thought it an unprofitable thing to teach boys grammar and catechism—together.

Joy Harding! How the very sight of the name, and the familiar shape of the letters of it even, thrill me still after all the years! It surely is that at times the decree has gone forth from the All-wise that a perfect woman shall walk amongst us here on earth—a woman whose every word, and glance, and touch are strong as love, and tender as tears; merciful to heal, and powerful to save, the wearied and erring soul. Is it sinful to love such a woman dearer than all else whatever in the world!—dearer than all the cherished memories of home, of kindred, and the strong friendships of youth?—dearer than dear life itself! And this have I done, all of this, in the times that are long past now. Much need have I, when I look back upon the past, to be ashamed of some of it; and yet of this great love that I bore and have carried all my life since, I have never wished that it had been otherwise than it has been—ah, never! Old as I am and gray, *that* love is fresh still, and will be till I die. Nor can I feel it to be wrong to adore a human creature so; to adore her memory—thy memory, dear Joy! No; not if an angel came to say it.

I shall meanwhile go on with the other parts of my life, and leave you to see how things turned out with Willy and me—how our two lives were made very different, and how it all came about.

Willy and I used very often to meet little Joy Harding with her governess, who was a tall, thin Frenchwoman. They used to walk about the green lanes in the summer afternoons; and sometimes Miss Joy used to ride upon a small Shetland pony, not much bigger than our mastiff, with its shaggy mane drooping over its bright eyes. At these times, a small but very impudent groom, with the manner of a monkey, and the shape of a ten-year-old man, always rode behind, on a larger pony, which was many sizes too big for him. One day, this little groom was the cause of what might have been a serious accident. Willy and I had met the party as usual, Joy on her pony, smiling and prattling to the tall governess, walking alongside; and the saucy groom riding behind, sometimes cross-legged, and sometimes leaning illy with his elbow on the pony's shoulder, with his tiny feet out of the stirrups. These positions he was in the habit of assuming, with a great appearance of suffering from colic, whenever he saw us approaching. On this occasion our looks had been particularly attracted towards the eccentric groom, who was excelling himself in an exhibition of grotesque distortions: in short, we thought he had fairly taken leave of all the little sense that had ever been in him. The French lady, turning round, uttered an ejaculation at the spectacle she beheld, so suddenly, that Fairy, Joy's pony, started and swerved aside towards a steep ditch by the roadside. Little Miss Joy would have been thrown at once into the ditch, but for the fortunate chance that Willy and I stood in the way. The excited pony tumbled over us, and we all fell scrambling together on

the roadway. Miss Joy fell backwards on the side where I lay sprawling; and I to this day am thankful that I had sense enough to catch her in my arms, and roll myself partly into the ditch, and out of the way of the struggling pony, holding her safely out of the muddy water, until the governess came to take her up. I crawled out; and there was poor Willy, with blood on his face, lying on his back on the roadway, and the groom standing over him, pouring water upon him out of his hands. Willy had been struck by the fore-hoof of the pony, and stunned; and many a long year afterwards he carried the white mark of it through the bronze of an Indian sun. The governess assisted Joy to a cottage; and the groom (who led back the ponies) and I carried Willy there also, for we could not bring his senses back. We laid him on the bed; and very pitiful it was to see his poor white face by the side of Joy's. But Joy was not insensible, only dazed and frightened; and presently she set up a wail at the sight of Willy, thinking, no doubt, he was dead. And indeed, so we all thought, for all that the old woman of the cottage and I could do was of no avail to restore him. The French lady took no notice of him, but hovered over Joy in a strange, wild sort of way, the like of which I had never seen in the North before. Joy threw her little arms round Willy's neck and kissed him, and put her sweet face upon his breast, sobbing most violently, and screaming whenever the governess attempted to take her away; and I feel sure that it was her warm young life upon his heart that called back the life to him at last. The faint colour came stealing slowly upon his lips under her kisses; and he sighed once or twice, and before long unclosed his eyes, with a wide-open startled look that I had always noticed in him when he felt any strong emotion.

Joy was sitting on the bed with a look of awe upon her child-face, when suddenly the squire, who had been sent for, entered the cottage, and came straight to her, taking her in his arms tenderly, and holding her tight. But Joy looked back over her shoulder at Willy still, and a look of pity grew in the squire's face as his glance followed hers. Then with sudden sharpness he turned to the groom and said: 'Go for the doctor; quick!' By that time, however, Willy had recovered a little, and was lying very quietly, with his temples bound up in a cloth, and his eyes, I remember, with the still startled look in them. The squire stood near him, with one arm clasped round little Joy, her little white hands clinging fast to it. The Frenchwoman had recovered from her fright, and was telling the squire all about the accident in a wonderful way.

The squire stood there a long time looking down at Willy; and I well remember the sad expression of his face, although I knew nothing of its meaning then, and as little did I guess the nature of his thoughts. I only saw the proud Squire Harling, and thought it was very good of him to be sorry for Willy. He took no sort of notice of me at all, which I was aware was only natural, although I must have been a noticeable enough object, being drenched and plastered all over with water and mud from the ditch. I liked him better though, as he stood there silently, much better than ever I had done before; and I ventured to look at his face, a liberty I had not up to that time

been equal to taking, only knowing him by his clothes and voice; and I remember, boy as I was, thinking what a fine clear face he had, and how well shaved it was from ear to chin.

Before long Dr Lambton came with his gig, and said Willy might be moved; and as the mill was a mile off, and the Hall quite near, the squire directed that he should be taken to the Hall. So they removed him there in the gig, the squire walking alongside, with Joy clinging to him. But before he went, the squire told me to run as fast as I could, and tell Uncle Stephen where Willy was. I was quite pleased to think that he had seen me after all, and I ran home as the crow flies.

I expected Uncle Stephen to be as glad as I was about Willy being taken to the Hall; and I was, therefore, greatly astonished to see a black angry look on his face, mingling with the look of pain, when I told him of Willy's hurt. He seized his hat at once, and strode off in the direction of the Hall, I following him by instinct, straight away to the front-door of the mansion. It was open, and he walked straight into the great entrance-hall. I followed as far as the mat, beyond which even my instinct of following deserted me, and I stood gazing at the rich furnishings and the grand painted window in the staircase. I heard Uncle Stephen ask a servant sharply where his master was, and then I saw him disappear up the great stair, where, to my excited imagination, he seemed as if going to heaven, for by that time the summer sun was setting, and glowing through the painted window, making it very beautiful, and striking me with awe; for the large figures on it looked as if alive, and not like the painted men and women they were. I have seen the setting sun shine many a time since upon that same rich window, and I know now the sweet scriptural story that it tells with its groups of dazzling figures; but I have never seen it again as it looked that day.

I sat down in the hall, and had not waited long before Uncle Stephen came back again with Willy in his arms. I was fairly startled at the angry way in which he walked out of the house, but I followed mutely. When he got outside he wrapped Willy carefully in his coat, although the evening was warm, and walked all the way in his shirt-sleeves, carrying him home to the mill.

It was not for years after that I got to know what took place up-stairs while I waited in the hall. I have known since, not from Willy, who remembered nothing, but from Joy herself, who, although only eight years old, remembered everything that passed. The squire had ordered that Willy should be carried to his own room; and the two ladies of the house, the doctor, the squire himself, and little Joy holding by his hand, were all there when the miller's presence in the house was announced. Uncle Stephen was not a man to be kept waiting much at doors; so, thrusting aside the footman, he walked up to Willy, who was sitting in an easy-chair, looking very pale and listless. The lad jumped up excitedly when Uncle Stephen entered, but fell back again with weakness; and Uncle Stephen knelt by his side, putting his arm round him, supporting him. Then, looking towards the squire, he said: 'Mr Harling, I did not expect ever again to enter your house, for good or ill, after our last meeting within it; but I thank you all the same for looking after the boy till I came. Now that I am here, he is mine again, not yours.'

Joy, who often spoke of the scene, always told me that when Uncle Stephen said these last words his colour rose, and his eyes flashed defiantly at the squire, who answered him not a word. Then fussy Dr Lambton—Breezy Lambton, as he was called—interfered to prevent Willy being removed, for Uncle Stephen had by that time raised him in his arms jealously, as though fearing to lose him. But the squire laid his hand upon the doctor's shoulder and motioned him to silence. So Uncle Stephen bowed to the ladies, who seemed to understand his words and manner as well as the squire did, and then he lifted Willy, and walked silently from the room with him. The squire followed him to the landing outside the door, and said something to him in an undertone, speaking very earnestly, and the two looked into each other's faces for a brief moment.

'Mr Harding, I cannot,' said Uncle Stephen, as he went down the stair; while the squire looked after him with the same look of regretful sadness on his face I myself had noticed when he stood silently looking at Willy in the cottage.

Uncle Stephen carried Willy all the way home, as I have said, and took him up-stairs and undressed him himself; and all that night, and nearly all next day, and the next night after that, he sat by the bedside watching Willy, and waiting on him with great tenderness, although Hannah the servant-maid begged of him to let her do it all. But there was no danger except a little fever, although it was the best part of a fortnight before Willy was fairly himself again.

I moped and was miserable all the time, for I could not live without him. The lessons at school were doubly bitter; and I was almost glad that old Snuffy Tegg thrashed me so holly and often, because it seemed somehow that I was enduring it for Willy's sake. A gloomy letter A, imprinted on my mind for life, dates from this period. I took it in from the repeated occasions in which Snuffy's legs of rusty black strode over my writhing body, while I was being put through an undeniable thrashing.

AN ANGLO-INDIAN ARTISAN'S DAY.

INFLUENCED by the prospect of bettering my condition, at the latter end of 1870 I accepted an offer of constant employment at my trade as a 'fitter' on the railway at Kurrachee; and thither removed with my wife in the beginning of 1871. The climate and other conditions of existence being so different in India from those of England, a sketch of my daily experiences may be not uninteresting. Early, every morning, I am aroused by my servant calling out that it is time for work. Not unwillingly I rise from the bamboo couch on which I have been vainly endeavouring to obtain a little sleep; and in the intervals of dressing, drink the cup of hot tea, as is my custom on rising. Although the room in which I have been trying to sleep is open to the four winds of heaven—had they but listed to have blown—it is close and unpleasant, and I gladly hurry into the open air. The sun has not yet risen, but the short dawn which precedes his appearance is rapidly brightening; the eastern sky becomes aflame; the trees which dot the

surface of the ground, stand out in shadeless relief against the bright background; and all around is hushed in the silence which in all climes ushers in the day.

I have no time to lose, for ere an hour has passed, the morning freshness will have given place to the sullen sultriness of an eastern day, so I step briskly forward. Scarcely have I left my bungalow ere the bark of a pariah dog, the crowing of a distant cock, the chirping of innumerable sparrows, and the 'cheep! cheep!' of the pair of house-squirrels who have honoured my house by making their home in its roof, announce that Nature has awoken. Away on the *maibon*, or open plain, appear herds of goats, trailing towards the jungle, a string of laden camels slowly trudging towards the 'bazaar,' and groups of natives squatted on the ground performing their toilets—which mainly consists in polishing their teeth for half an hour or so with the charred end of a stick—or a Parsee standing with clasped hands praying to the rising sun. I continue my walk with nought of interest to catch the eye. Nought on either side of me but a vast expanse of sunburnt, gaping earth, or a dwarf-tree or two, whose dusty leaves hang motionless in the still air; nought under foot but a hard, dusty road; and nought above but a cloudless sky, rendered lurid by the rising sun. Still, the walk has its charm, for the air, though not a breath stirring, has a grateful freshness in it; and I know that, in a very short time, my chance of obtaining that freshness will be gone for another twenty-four hours. Half an hour's onward walk, then back to breakfast, but before breakfast to bathe. After my bath, arrayed in a light linen suit, I take my place at table, where my wife usually makes her first appearance. Over the meal is discussed the bazaar expenditure for the day, usually ending in a dispute with the cook over the previous day's expenditure, which he invariably provokes by his propensity to exact a little advance on the market-rates. Breakfast over, I light my cheroot, and start for the workshop, well protected from the now intense sun by a pith-hat and a quilted umbrella.

How can I describe the dead, aching misery of eight hours spent in a workshop, chipping and filing, chipping and filing, in an atmosphere where the thermometer stands constantly at ninety degrees! The perspiration oozes from every pore, and one's mouth involuntarily gasps for a breath of fresh air. It is not the heat which makes things so unbearable, so much as the oppressive closeness, which takes all the energy out of a man, and compels him to work to keep awake. As hour after hour of the forenoon passes, the sultry closeness, with its accompanying exhaustion, becomes intensified, and gratefully is heard at noon the signal for an hour's pause for tiffin—a meal usually of a very light nature. After a refreshing 'peg' of brandy and soda, the call to renewed labour is heartily responded to. Another four hours of perspiring exertion with no diminution of the heat, and

another refresher of effervescing drink, and then I retrace my steps towards home. Arrived at home, I change my working-clothes for a suit of light tweed, and then dine. My dinner materially differs from that of my fellow-craftsmen in England. Steak, roast-beef, mutton, or beer seldom grace my table. The native cook—though great in made-dishes, whose components no Englishman could guess, and perhaps would not be over-pleased did he discover—is not equal to cooking a steak, should I be so foolish as to order one. As puddings are also a difficulty, we are content to make up our dinner with curry and rice, curried poultry—very cheap, but exceedingly small and innutritious—and some made-dish, finishing with a custard. Bread-and-cheese and beer, the usual make-shift dinner of my comrades at home, I could not afford except as an occasional treat, cheese and beer being at prohibitory prices—two shillings per pound for cheese, and fifteen to eighteen pence per bottle for beer.

Dinner over, I usually adjourn to the verandah for a quiet smoke. There, stretched at my ease in a chair (constructed with a sloping back and long projecting arms, to facilitate the elevation of the heels to the level of the head—an apparent *sine qua non* in hot climates), I puff my cheroot, and strive to get cool in the very depressing temperature; watching the while the glorious colouring of the sky and the peeping out of the brilliant stars. It would be useless to attempt to read, for the light would attract myriads of moths and winged things, who would persist in exploring the pages of my book, or, maybe, testing the quality of my skin. 'Chip! chip!' from the prickly-pear fence announces that the gecko has commenced his nocturnal pursuits; and as the shades deepen, the croak of the bullfrogs in the pond close by denotes the commencement of their night-long chorals. Occasionally the monotony is broken by the 'cheerup! cheerup!' of the muskrat, or the plit of a little lizard falling from the roof to the ground, or the distant 'tat-a-tat-ta, tat-a-tat-ta' of the tom-tom of a party of natives, on some religious errand intent.

By the time my cheroot is finished, my wife has prepared herself for walking; and we start to visit one or other of my shop-mates, if it happens that it is not my turn to entertain; for our amusements being limited to the paying and receiving of friendly visits, we are careful to keep up the custom. Arrived at our destination, we, after chatting awhile, engage in a friendly game at whist. A modest rubber or two suffices; and then, after a chat, a smoke, and so on, we say good-night, and start on our way towards home, for with us it is perforce 'early to bed and early to rise.' As we stroll slowly on beneath the clear starlit sky, we are apt to be startled by the sudden heavy 'flap-flap' of the wings of a huge bat, aroused from its hiding-place in some neighbouring tree. There is something weird in the appearance of these phantoms, as they suddenly rise in the still night, and circling with their great overshadowing wings round the tree for a moment, glide noiselessly away. They make a timid man start. Or, perchance, at some unexpected spot a water-buffalo will cause an unpleasant sensation, by suddenly raising its head, which, in the dim uncertain light, appears strangely huge and monstrous.

Arrived at home, we prepare for rest. Vain

preparation! Despite the most diligent search, and careful closing of the mosquito-curtain, one has scarcely lain down, ere buzz, buzz, buzz! announces the presence *inside* of the dreaded enemy. The noise is aggravating; one monotonous 'buzz!' never varying in tone, and ceasing only to be followed by the sharp stinging bite on some exposed part of the person, an insult rendered the more aggravating by the knowledge that successful pursuit is hopeless. The only chance of relief is in giving a smart slap on the spot where the sting is felt, but with the encouraging result, that in nine cases out of ten, the victorious 'buzz!' of the enemy is again heard a moment after overhead, and the tingling smart of the blow the only consolation!

Despairing of sleep, I try to read, and have read perhaps a page or so, when 'cheerup! cheerup!' and a most disgusting odour declares the presence of a muskrat in the room. It's no use; he must be caught before attempting to sleep. With murderous intent, I rise, and pursue him round the room, driving him from chest to chair, from chair to box, from box to matting, until after perhaps, a quarter-of-an-hour's chase, he escapes after all, to return again night after night with certainty, until caught and killed. Turning into bed again, I ignore the triumphant mosquito—or try to—and once more attempt to read; but the annoyance caused by the flutter of moths around the light, and the silent sweep of the small bats in pursuit thereof, are too much. Despondently I close my eyes; but sleep will not be wooed. The stifling air is hot and suffocating, but I know it is no better outside, so strive to while away the time by watching a lizard on the canvas ceiling catch flies. I come to take quite an interest in the silent way he pursues his prey—by a series of short quick spurts of a few inches, pausing between each; perhaps to measure the remaining distance, or maybe from caution; until finally his long tongue shoots out, and poor fly is engulfed in lizard's stomach. Presently, a most exciting chase commences. Two lizards approach the same fly from opposite directions; I watch with almost fatal breath the result. One more spurt from either, and the victim will be secured, when some animal falls 'flop!' upon the ceiling from the roof, and both lizards drop to the ground. In misery, I again close my eyes, and, by dint of keeping them fast closed, at last drop off into a fitful slumber, to be aroused at the usual hour by my servant's summons to work; which will be repeated daily, with but little variation, the year round, except that during the short season of cool weather—about four months—one does not suffer quite so much from the heat, and is to a great extent free from the plague of insects.

Not a very pleasant life to lead, perhaps, but it has its advantages. The pay is good—two hundred rupees, or twenty pounds, per month; and the expenses not very heavy—say, at a rough calculation, three rupees per diem for living, twenty-five rupees per month for servants, and twenty rupees per month for rent of house (a rupee is equal to two shillings); enabling us to put by easily five pounds per month towards the time, which nearly all Anglo-Indians look forward to, when they shall return home. The cost of servants also being comparatively little—a cook can be obtained for sixteen shillings per month, and an *ayah*, or nurse,

for about the same—the necessity for the wife to engage in menial employments does not exist; nor does washing-day interfere with the husband's comfort, for, for some ten shillings per month, the *dhobie*, or native washerman, will gladly do all that is necessary in that department. 'Use is second nature,' and so it proves with us. Habituated to the discomforts incidental to the climate, we think but little of them; or if at any time inclined to do so, derive consolation from the thought of our gradually accumulating savings, and the time when we shall be once more in Old England.

FAIRY.

OLD SALFORD is fast disappearing beneath the levelling hands of the Improvement Commissioners; and it is little to be regretted, since some of the vilest slums it has ever been my lot to walk into—and they are many—were in that borough. Down by the river it used to be worst of all. In the hot summer and autumn months, when the Irwell had half-dried up in its shallow bed, and vast banks of deposited filth lay exposed to the broiling heat of the sun, the stench emanating from that hot-bed of disease was something frightful. It is slightly better now; but all the efforts of the Commissioners can only make it a little less nasty, since it can never be, nor can it ever deserve the name of, a river; it is only an open sewer.

It is with one of these river-side streets that we have to deal. It was called Sunnyview. Oh, mockery of a name! The only view was in front; a wretched tumble-down wall, scarcely breast-high; below that the river; and across that black stream, the gloomy blank front of an old spinning-mill. Sunnyview, indeed! It was very little sun they got there, for the row of houses rejoicing in that name was built up on each side by a huge mill, that cast a dark shade upon the poor wretched habitations lying between them. The houses were hovels; the ground in front was a puddle in wet weather, and a drying-ground for the scanty clothes of the inhabitants in dry. Not a door shut true; not a window could boast a latch; and many a pane of glass was wanting, and its place taken by a bundle of rags or a piece of paper, or left gaping. The roofs let in the rain, the walls rained tears, when the cold damp autumn days were on. The floors were cracked flags; the stairs were all broken and worn; the plaster had left the walls, and the bare bricks shewed through. They were not fit for human beings to live in; and yet each of these tenements held two or three families, one for each room; generally the same room being bedroom, kitchen, and sitting-room all in one.

The inhabitants of this place were dirty; they were ragged, they were poverty-stricken for the most part, and often had scarce ought to live on; but they were cheerful, and even gay in general, and took life as they found it, bravely, and apparently ignorant of there being any merit in cleanliness and godliness, for I am afraid few ever went to church or chapel. Sunnyview was of course overrun with children, as such places nearly always are. There was one family, however, rather different from the rest. They were poor, it is true, but

they were clean. The husband in this case was not a drunkard, as nearly every one else in the row was; nor was his wife as slatternly and idle, or as fond of gossip, as her neighbours.

The one room they inhabited was clean and tidy, and though, by reason of the husband's infirmity—he having lost an arm, and thereby being rendered unfit for his trade, that of machine-turner—they were not rich, yet they always had something to eat and drink, and often a little for their less thrifty neighbours.

This couple had one child, a little girl of about six years of age, with flaxen hair and soft blue eyes, with the softest and most winning expression in them I ever beheld. She was the pet and idol of the whole of that poor street. She was not like most of the other children, dirty and rough, but quiet and sedate, with that air of wisdom that we see sometimes in children, and which the old women call 'old-fashioned;' sure sign, they say, of an early death.

The men used to bring her toys home when they received their wages on Saturday; and many a little ribbon, or other knick-knack, had the mothers brought home from Saturday night's marketing, with which to deck out little 'Fairy,' as they called her, on the Sunday. Poor and tawdry, most of them, and of no great value; but it is not value we look at in a gift—is it not the heart of the giver?

The way I became acquainted with Fairy was this. I was parish doctor for the district in which she lived, and my avocations, as you may guess, frequently led me into the dirtiest and worst parts of the place: one of these was Sunnyview. There was an epidemic of scarlet fever at that time, and it was in the streets along the river-side that it raged with the greatest virulence and spread the fastest. It soon reached Sunnyview. Nearly every child in the row had it, and among the rest, little Fairy was seized.

I never had a better or more obedient patient than that little child. She used to listen with such an air of preternatural wisdom to what I said; and they told me afterwards that whenever they wished to give her any thing, she used to ask: 'Did doctor say I must have it?' And unless they could answer 'Yes,' she would not take it. Fairy got over this illness (though many others in the street died), and was running about much as usual in a few weeks.

Through Sunnyview was a short-cut for me from one part of my district to another, and thus it often happened that I saw my bright-haired little friend.

'That is my doctor,' she would say, when she saw me coming, to her playmates, and leaving them, would run to meet me. I used to bring her sweets in my pockets sometimes, and when she had received them, she would walk with me to the end of the row, prattling in her grave, womanish way, as we went along. Arrived there, she always said: 'Good-bye, my doctor,' and then turned round and rejoined her playmates. I soon got to look out for her whenever I took that route, and always felt better when I had seen her. It was a relief from the constant strain on my mind, and the constant ingratitude and lamentings of my patients; for, believe me, of all the thankless and wearying occupations of this life, that of a parish doctor is but too often the most thankless,

the most wearying, and the most sickening. For the clergyman, they will make some attempt at tidiness, in readiness for his visit; for the doctor, none. They let him see everything, and take no trouble to put themselves in any better state for his visit. The constant struggle to instil any ideas of decency or cleanliness in those squalid houses is heart-wearying.—But to return to Fairy. As I said, I used to look forward with pleasure to the sight of her innocent face, as I went my round, and but seldom failed to see it. But the end came soon.

The wall which separated the front of the row from the river was getting into a sad state. All the mortar had gone from between the bricks, and the coping-stones were quite loose. I had several times seen the children standing on these stones, and shaking them with their feet as they did so, making them rock on the smooth tops of the bricks, and had as often warned the mothers that some accident would happen if they did not stop it. But no one took any notice. They called them off once or twice, but the reckless youngsters were on again as soon as the mothers' backs were turned.

One day, as I turned the corner of the houses, the children were at this game again, and among the rest, Fairy was standing on one stone, rocking it with all her might, and laughing for glee. I saw with dismay that the stone had worked quite loose from its neighbours, and was only about three-quarters way on the ledge of bricks, and overhanging the steep fall to the river in an extremely dangerous fashion. I walked quietly forward, so as not to startle Fairy; but ere I could reach her, she had seen me.

'Look at me, my doctor,' she called out, beginning to dance on the stone. 'So nice; look at me!'

Even as she said it, the stone rocked off the ledge; and ere I could grasp her clothes, the child had fallen down to the river's brink, the heavy stone on the top of her. With a cry of horror and dismay, I leaped over the wall, and rushed to where she lay. The stone was lying across her body. With a great exertion of strength, I lifted it off her, and took up the little body in my arms. She was quite insensible. Her head had come in contact with a sharp stone, and the fair hair was all dabbled with blood. I carried her into her home, amidst the wailings and lamentations of the neighbours, and laying her on the bed, proceeded to examine the extent of the injuries she had received. Though the blow had been enough to stun her, the cut in her head was not deep, and was soon bound up. I could find no other bones broken, just then, and sat down by the bed until she should come round.

In a few seconds she opened her eyes, and seeing me, smiled faintly. 'My doctor,' she whispered.

'Do you feel pain anywhere, Fairy? Does your head hurt you?' I asked.

'A little,' she replied; 'but oh, I feel so queer all over!'

'She's like too,' said one of the women, 'after that fall. Here, darling, sit up, and drink this drop of water;' bending over her with a cup, and putting her arm under the child's head.

Fairy tried to raise herself.

'Draw your feet up, my dear,' said another, 'and try to sit up.'

Fairy tried once more, but the feet and body never moved.

'Oh, my doctor,' she said, turning to me, her blue eyes full of tears, 'I can't. *I feel as if I hadn't got no feet.* I can't move my legs;' and her piteous looks and tones struck my heart with alarm.

I pushed the woman aside hastily, and again bent over the girl. Fool that I was; I had never thought of this; and my countenance shewed my anxiety, for all talking ceased, and every one watched me eagerly. It was as I had thought, when her words suddenly struck on my ears. There never could be more feeling in her legs. She would never rise from that bed again alive. The poor child's back was broken, and life was but a question of a few hours at the most.

I turned away as I made this sad discovery, and my eyes were wet with tears.

'Is it very bad, doctor?' said one of the women in an awe-struck whisper.

'So bad,' I replied huskily, 'that she has not many hours to live.'

The words went from mouth to mouth all round the little room, and every eye was moist.

After staying a little while longer, and giving such directions as I thought best for easing my little patient, I left, promising to call again at night. When I returned, the neighbours were still there, but now on each side of the bed were the father and mother of the dying child. Yes, she was dying, dying fast. I could see, as I entered, the painful drawing of the face that betokens dissolution—painful to witness, I mean, though not always painful to the dying one.

'Here's my doctor,' murmured Fairy, as I came up to the bed. 'Am I so very ill, doctor? They say I am dying; but that only means going up among all those bright angels they tell us about, up yonder. I don't see why they should cry for that. I have no pain at all. I only feel sleepy. Let me put my head on your arm, doctor. Dada! what are you going for, dada?' she cried, as the weeping father, overcome by his emotion, was leaving the room. 'Don't go, dada; I want you here to hold my hand. It is getting so dark, and I am frightened of the dark.—Mammy! you hold my other hand—hold it tight. That's it, with a sigh of relief, as the poor parents did as she wished. —'Doctor,' she went on in a minute, 'is it up among those angels that Jesus is? They tell us so at school. They say he loves little children. Does he love me? Will he love me as much as my dada and mammy do?'

'Yes, more.'

'More! Shall you be there too, some day, dada?'

'I hope so,' sobbed the heart-broken father.

'And mammy and my doctor too? Oh! that will be nice.—Dada, hold my hand tight. You're letting go, dada. It's getting so dark, I can't see you. Where are you all? Kiss me, dada, and mammy—and—you—too—my doctor. I can't—see—you—now. Jesus—bright—angels. Dada—mammy—'

A short gasp for breath, and then the fair head fell back on my shoulder, and the sweet eyes closed in their long eternal sleep. Poor Fairy!

FRENZIES OF FASHION.

In the neighbourhood of London, in almost any direction, but chiefly towards Hert and Essex, where there are many beautiful groves of trees and thick hedgerows, you may see, on a Sunday morning, bands of a mean order of wayfarers carrying cages and other apparatus for the purpose of catching small birds—larks, finches, nightingales, or whatever little feathered creatures they can possibly secure. To speak quite plainly, we would call these depredators a set of heartless ruffians. What may be their ostensible profession, we know not. Sunday being an off-day, on which no wages can be earned, and no advantage is to be gained in the way of traffic, they set out on these bird-catching expeditions. There they go roving about the country, haunting the open commons and green lanes, also private domains; for they are not the least particular as to encroachments. They are out for a holiday, with an eye to business. While the more orderly population are at church, they are spreading their lures, watching to ensnare the feathered songsters and chirrupers that are flitting about innocently in the sunshine, and adorning the landscape by the beauty of their form, their graceful movements, and their gay plumage. These depredators may be compared to the class of men who are engaged in the hideous practice of slave-catching. They have neither any sense of justice nor of mercy. Their proceedings are a scandal to decency and humanity. Having completed their nefarious day's work, back they will be seen wending their way to town with their cages crowded with miserable captives—a sight truly pitiable.

There is now a law with denunciatory penalties against the capture of certain birds during a certain season, but the statute is imperfect, and, at any rate, it is shirked in various ways, and fails to deter the habitual bird-stealers to whom we refer. Under strong temptations of pecuniary advantage, they either openly defy the law, or carry on their trade under false or illusory pretences. Seized by the police, and taken before magistrates, what then? If convicted, they may

be condemned in a small fine, not difficult to pay. As for any loss of character arising from prosecution, the idea is ridiculous. There can be no loss of character among those who, as Burns humorously sings, 'have no character to lose.' In short, the law as it stands is very much circumvented, and wild birds are captured in enormous numbers.

In France, small birds are caught and killed, principally as articles of food. You see them hanging in bunches at the doors of poulterers' shops, to be bought by keepers of hotels and restaurants. In the *menus* or bills of fare at the *tables-d'hôte*, dishes of these hapless birds make their appearance as an *Entrée d'alouettes et de rouges-gorges*—in plain English, a dish of larks and robin redbreasts. Larks, we believe, are not quite unknown at some 'highly respectable' tables in this country; but, happily, the custom, so revolting to public feeling, is not likely to be generally followed. Nor do we imagine that there need be any fear of robin redbreasts becoming a popular dish at our dinner-tables. Small birds appear to be captured wholesale for some other purpose than being eaten. Some of them are sought for as song-birds to be sold to dealers, who supply them for parlour cages. Of this we have an evidence in shops that are stored with a variety of feathered and furred animals, secluded in different-sized cages—the birds hung about on the walls in a state of disconsolate agitation, like so many distracted slaves penned up for the choice of customers. As regards nightingales, their purchase may prove disappointing. If caught after they have paired, and deprived of their mates, they cease to sing, pine in their solitary imprisonment, and die of what we might call a broken heart—a mournful instance of man's wanton outrage on the affections.

We have never looked with complacency on the practice of keeping birds as domestic pets in cages. In the most favourable circumstances it looks like cruelty. The bird is made a prisoner for life. The cage may be gilded and well equipped as to food and water. But it is still a prison. The

little creature is violently and unjustly deprived of the liberty which is undoubtedly its natural birthright. Helpless and in our power, it is wronged. A contemplation of it day after day, and year after year—sometimes warbling, sometimes with eyes faintly turned to the sunshine, like a prisoner looking wistfully from the bars of his window—is calculated, we think, to move the feelings. The very lilt of its sweet notes has in it something doleful. The songs of birds are instinctively a call to companions, and in confinement no companions are usually near. The piping is thrown away. On hearing these abortive calls, our memory is led back to days long gone by, when audiences were almost melted to tears by the pathetic song of that charming dramatic vocalist, Miss Stephens—

The bird in yonder cage confined,
To me sings notes of sorrow.

Or more emphatically, we are reminded of Sterne's starling, uttering the cry, 'I can't get out, I can't get out.' Like Sterne, we feel the force of the appeal, though the sounds may be less significantly expressed. We have never kept a caged bird, and never will. Our pets must be left at liberty to roam out and in as they please, only under such restrictions as will tend to their security and comfort.

The caging of small birds does not by any means account for the great number captured by vagrant trappers. There is now a demand for birds of this kind far beyond that either for the table, or for cages. The source of this new demand is in one of the whimsical frenzies of feminine fashion, and while under the influence of this irrational furor, no more regard is paid to the claims of birds on our compassion than is felt by slave-catchers for the victims whom they drive away into hopeless servitude. It is painful to speak of cruel outrages being committed through the weak vanity of ladies. Only thinking of what will minister to a feverish fancy, they seem indifferent to the wrongs which they are the cause of inflicting on the lower animals.

We allow that feathers are an adornment to the female head-dress; and kept within reasonable bounds, this species of decoration is far from being objectionable. The case is very different when we come to consider that gross abuse of the practice which consists in wearing the feathered skins of wrens, humming-birds, nightingales, larks, finches, and robin redbreasts. Are ladies who so decorate themselves aware of the fact, that these poor little birds are for the most part skinned while alive, in order that their plumage may retain that degree of gloss which is not ordinarily found in skins that have been flayed from the body after death? Talk of vivisection! Here is something infinitely more atrocious, and devoid of any excuse. Vast numbers of birds are either so stripped of their skins, or plucked of their feathers during life. The correspondent of the *Telegraph*, London newspaper, says that 'he has seen as many as five hundred lark-skins in a shop window for sale at sixpence-halfpenny apiece,' together with the information that 'thousands were inside.' He adds: 'In one of our leading City thoroughfares, I saw a large number of sparrows, starlings, blackbirds, and

various other kinds, including robins and wrens.' Another correspondent mentions that a dealer within his knowledge, exposes for sale, stuffed for ladies' bonnets, robins at eightpence each, and that in his window there is a representation of the trap by which these birds are caught.

From the daily press we could multiply evidences of this species of slaughter. 'The fashion now so prevalent,' says the *Standard*, 'of ornamenting ladies' hats and bonnets with small birds, has given such an impetus to the activity of the birdcatchers, both here and in France, as to cause well-grounded fears for the annihilation of our favourite little songsters. This was forcibly pointed out in a case which came before the Dover bench, in which two men were charged with trespassing. Upon them were found no less than fifty-one dead skylarks, and a large number of linnets, thrushes, bullfinches, and other birds. A gentleman connected with the Customs at Dover stated that it was well known that a large premium was paid to men like the prisoners for these birds, and that it was within his cognisance that during the past fortnight no less than two thousand of the brightest-plumaged birds from Normandy passed through Dover on their way to a firm of milliners in London, their destination evidently being to ornament the hats and bonnets of Belgravian ladies. The Bench stated their determination to punish severely all future offenders.' In some cases, birds are deprived of their wings, for the wings of certain birds are deemed a superior decoration to head-dresses. Let us hope that the little creatures subjected to these cruelties are killed in the process of being rilled of their plumage, instead of enduring the pangs of protracted dissolution.

Native birds are not alone sought for and sacrificed to the varying demands of Fashion. The world at large is laid under contribution. Germany, North and South America, the islands of the Pacific and the Atlantic yield their tribute. The demand for canary feathers goes considerably beyond the capacity of the home market. We have seen it stated that a wealthy lady, desirous of outshining her neighbours, had a dress which blazed with the feathers of a vast number of canaries. If this be true, we wonder how a lady could shew herself with any consciousness of self-respect.

We do not in the least expect that any observations of ours will have the effect of turning the tide of fashions that are substantially founded on cruelty to different kinds of animals. To be in the fashion is a desire which overleaps all considerations of humanity or common-sense. We can at all events point out and protest against the scandal which the practices spoken of bring on the female character. In these days, we hear no end of harangues on the injustice done to women, and of their claims to an intellectual and political equality with men. Abstractly, we do not contest their mental qualifications. But obviously they lay themselves open to charges of a want of moral courage. They evidently have not the fortitude to resist the changes of fashion, however idiotic. They cannot stand out against the use of some equipment, although it be of the most ridiculous kind, positively worthless and unsightly—such as huge bunches of false hair stuck on the back of their head. At certain

reasons, they will perseveringly dress themselves in jackets made of the skins of seals and saibles, though made aware that the practice is not only injurious to health, but is the source of incalculable cruelty. They, with equal disregard of what is objectionable, decorate their persons with spoils torn by ruffians from the quivering bodies of some of the most innocent and beautiful of God's creatures. We do not mean to say that all ladies of high and low degree are chargeable with a guilty complicity in these monstrous crimes against humanity. There are noble examples of the reverse. And what more noble instance of one who in every shape sets her face against cruelty to animals, great and small, than that of the BARONESS BERDETT COURTS! May her ladyship be successful in her untiring and disinterested remonstrances against the practices to which we have ventured to call attention. In a word, torturing and killing small birds with a view to the embellishment of female attire, ought on all hands to be peremptorily discontinued. For very decency's sake, we should hear no more of the 'rights of women,' till these and such-like outrages on humanity, feminine delicacy, and common-sense are relinquished.

W. C.

FALLEN FORTUNES.

CHAPTER XVI.—ON BOARD THE 'MARY.'

'JENNY,' whispered Jeff, as he walked beside the little invalid carriage, in which she was wont to be conveyed when there was the least risk of fatigue, on its way to the boat-house, 'what do you think of Holt's get-up?'

'It is ravishing,' was her enthusiastic reply.

The remark was called forth by a suit of rough blue cloth, adapted for marine purposes, and a hard shiny hat, such as one expects to see surrounded by a ribbon, embroidered with the name of a ship. It was not, however, so surrounded; and the hue of the clothes, though of unmistakable azure, was very modest in tone. Mr Holt's attire would, in short, perhaps have altogether escaped censure, had it not been so undeniably new; but as it was, it gave the idea of premeditation. This gentleman, as Jenny had averred, had a special suit for every occasion; not only morning-dress and evening-dress, and driving-dress and riding-dress, but even a particular attire for croquet; and now it appeared that he had not come wholly unprovided with even a yachting costume. So far as his tailor could do it, he was, in fact, equal to any situation that country-life could place him in, and it was obvious that he had been in none of them—nor in the suits to match—before.

'There is one thing,' continued Jenny, 'that I must see before I die, and for which reason I wish it was winter. I yearn to behold that man in scarlet, with top-boots and a hunting-cap: that he has got them in his portmanteau, only waiting the opportunity for production, I am confident.'

'He would look even more like a monkey than, than he does now,' observed Jeff contemptuously.

'Not a bit of it. You wrong him there, Jeff. He would only look too new, like the gentlemen sportsmen who ride on horseback in the tailors' shops in Regent Street. What irritates me is his being always so spick and span, so offensively pat with the occasion. I think, however, Mrs Campden likes it.'

'Why on earth should she like it?'

'Well, she feels it a personal compliment that he should have made such extensive preparations for his visit to Riverside. His only mistake has been that he did not provide a suit of Lincoln green for the archery-ground.'

Certainly his hostess seemed unusually affable to Mr Holt as he walked between her and Mrs Dalton down to the river, while Mr Campden preceded them with the two girls.

'Have you ever been in a steam-yacht?' inquired she, with an approving glance at his metal buttons.

'No, madam.' He always called her 'madam'; and she was not displeased at it. It seemed to mark the difference of social rank between one of her exalted position in the county and a mere stock-broker.

'I have been in other yachts often enough; indeed, I may say too often, for I am a very indifferent sailor. I have several friends who are yachtsmen, but it is not everybody who can offer one a cruise in a steam-yacht.'

'I think you will find the *Mary* very comfortable,' answered Mrs Campden languidly. 'It is named, as you may guess, after my daughter. She christened it, when it was first launched, with a bottle of the best champagne. For my own part, I thought it very extravagant, but my husband would have it so.'

'It should not have been dry champagne,' said Mr Holt, with a little smile.

'Why not?' inquired Mrs Campden. 'It would have been better—because cheaper—than claret.'

'No doubt, no doubt; I was only referring to the irrelevance of christening a ship, you know, an article intended for the water, with dry champagne.'

'Oh, I see,' said Mrs Campden coldly; 'it was a joke.'

'It was a very little one,' said Mr Holt apologetically; then, sensible that he had made a quotation, not exactly from the classics, he blushed, and with great earnestness asserted that he was entirely of his hostess's opinion as to the wicked waste of using claret for any such ridiculous ceremony as christening a vessel.

'There was, however, nothing ridiculous about christening the *Mary*,' observed Mr Campden chillingly. 'Lord Wapshot—who is our lord-lieutenant—was so good as to honour the occasion with his presence; and we had three or four hundred guests in a great tent, from Edgington's, upon the lawn.'

'It must have been a splendid spectacle,' said Mr Holt respectfully.

But the lady of the house was not to be mitigated; she had been joked with by a stock-broker, and was resolved to resent it with becoming severity.

'My dear Edith,' said she, addressing her other companion, 'what a pity it is your husband cannot accompany us this morning: there is nobody like him for making an expedition of this kind go off.'

'He said he would perhaps join us in the course of the afternoon,' said Mrs Dalton. 'I am sure he regrets not being able to come, as much as you are good enough to say you regret his absence.'

'Well, I don't quite agree with you there, Edith,' answered the hostess dryly. 'I must confess that I think if Mr Dalton wanted to come, he

would have come.—What do you say, Mr Holt? Do you think that he is so wrapped up in business as to allow it to interfere with what is really more pleasant to him?'

Mrs Campden was one of those uncompromising women who, if they were common, would make social life intolerable. If not absolutely delighting in battle, she would not go a hair-breadth out of her way to avoid it; she knew that she would get no assent from Mrs Dalton, yet if she had been alone with her, it is probable that she would still have hazarded the same opinion; as it was, she turned to her male guest, reckoning confidently that he would purchase his own forgiveness at the sacrifice of his friend. Here, however, she was mistaken.

'Indeed, madam, I cannot agree with you. Mr Dalton has not only an aptitude for business, which, considering he has only taken to it comparatively late in life, is surprising, but I have never known him postpone any matter of importance to mere pleasure.'

Mrs Campden sniffed incredulously. 'Ah, you men always hang by one another,' she said, 'when one comes to talk of the great art and mystery called business, which you would have us believe no woman can understand; but I have known some very ordinary people who have succeeded in it uncommonly well.'

Poor Mr Holt; he really looked very 'ordinary' when she said that. He would have flattered himself, if it had been possible, that she was alluding to Mr Campden, but the glance with which she accompanied her remark, made that impossible. He hoped at least to meet with gratitude from Mrs Dalton, to win whose favour he had thus boldly defied their hostess, in defending Dalton; but she only favoured him with a forced smile. The whole subject of business in connection with her husband was painful to her; she felt, too, that he needed no defence, and least of all from Mr Richard Holt.

By this time they had reached the boat-house, from which they were to be rowed to the yacht, which was waiting for them with her steam up in mid-stream. It was a beautiful craft, fitted up solely with an eye to comfort. The smoke and steam, and all the disagreeables, were confined to the after-part of the vessel; and the fore-part, consisting of a raised deck and highly decorated cabin, was admirably adapted for a party of pleasure. Upon the deck they all took their seats, except Mr Campden, to whom confinement of any sort was disagreeable, and who paced up and down, not so much like a sea-captain on his marine domain, as a hyena in a cage. It was very good-natured of him to have proposed the expedition, for it was not at all to his taste. He would have much preferred to be roaming about his territorial possessions with an axe in his hand, cutting down trees at random, to which occupation a man who has exchanged town for country, late in life, is pretty sure to condemn himself. He was wont to term it 'thinning the timber,' until Dalton had given another name to this amusement of his friend—'raising money on the estate.'

The river-voyage was very beautiful, with craggy hills on one side, and on the other rich meadows and woodlands, which 'marched,' as Mrs Campden took occasion to remark, 'with the Riverside property;' but it was of short duration. In a little while they

reached the lake, a broad sheet of open water, with no great picturesqueness to recommend it. Blea-barrow mere is inferior both in grandeur and loveliness to even the least attractive of the Cumberland and Westmoreland lakes; it is high placed, but the shores are low and barren. It is, in fact, surrounded by moorland. When the first ebullition of spirits that always accompanies the start upon a pleasure-trip, had subsided, even the young people began to feel a sense of boredom. It is possible that salt-water may have an enlivening effect—indeed, it must be so, or only the very poorest persons, with something solid to gain by it, would surely commit themselves *twice* to a long voyage—but it is certain that expeditions upon fresh-water, unless it be on a river, where you can land if you please, soon become excessively tedious. People get tired of one another's company afloat in one-tenth of the time that they do on shore. The air and the water together have also a sedative effect upon that large class of persons who are charitably described as 'having no great resources within themselves'—in plain English, who do not know what it is to think.

In half an hour, Mrs Campden was giving more assents by nods, to the opinions expressed by her companions, than she had given by words for the last six months. If you had taxed her with being asleep, she would doubtless have indignantly denied it; but it was true, nevertheless. Her husband, who openly confessed that he did not 'care for scenery,' was conversing, cigar in mouth, with the ship's engineer about vertical and horizontal movements. Mrs Dalton, who sat beside her hostess, was not, indeed, like her, in the land of dreams, but she was scarcely conscious of what was taking place around her; her thoughts were busy with the sad future that was awaiting—and so immediately her dear ones, but of which they had as yet received no hint. Their lively talk, though she heard not the words, jarred upon her ear; their laughter smote her heart only less sorely than their misery would presently smite it. In a few days—in less than a week—they would leave Riverside for what had been their home, but which was now, in fact, no longer theirs, and then the news of their ruin must needs be broken to them. In a few months, another child would be born to her—the consciousness of which is of itself depressing to most women—heir to its father's fallen fortunes, and a new burden for them to support. Physically, she was far from well; an abiding sense of weakness was always present with her, which gave her apprehensions for the future, when her time of trial should come; but they were not apprehensions upon her own account. Persons of her pure, self-sacrificing sort are the last in the world to entertain a high opinion of their own merits; but if common-sense be allowed to enter into the region of theological speculation at all, they are probably conscious that things must needs be well with them when they have shuffled off this mortal coil; that the end of their labours—even though they ignore all thoughts of reward—must needs be good and gracious; at all events, they have no fear, save the fear of being taken from those they love, and who have need of their love. Oh, deep and terrible mystery of life, wherein such beings as these suffer and perish, while the vile and selfish prosper and live on!

In Mrs Dalton's face, indeed, could be read nothing of this; a serene cheerfulness pervaded it, not only to common eyes, but even to those which affection had rendered keen; but she felt herself unequal to any attempt to promote hilarity. The duty, therefore, of making the time pass agreeably devolved solely upon the 'young people,' and Mr Holt, and the latter had by no means been formed by nature expressly for this vocation.

'We are getting deadly dull,' said Jenny presently, after a meritorious struggle or two to 'lift' the conversation, which had done more harm than good, and indeed left it a corpse. 'What do you say to "Lights" or "Twenty Questions"?'

These were drawing-room games which were sometimes played at Riverside, and with which all the party were familiar. In the former, two persons select a word of various meaning, and talk of it aloud under its various aspects; though taking care not to name it, while the others guess, from the 'lights' thus thrown upon it, what the word is. Even then it is not mentioned; but whoever thinks he has discovered it joins in the conversation, and is admitted into it, permanently or not, according to the correctness or otherwise of his surmise. So one by one the whole company join in, till some unhappy wight, not apt for the amusement, finds himself out in the cold, the solitary listener to a general conversation of which he does not understand the drift. Mr Geoffrey Derwent, great as he was at croquet, unrivalled in the archery-ground, and by no means despicable at the billiard-table, very often found himself at Lights in this unsociable position. Mr Holt, on the other hand, though by no means good at games that require dexterity, had rather shone at Lights, though, it is true, in a very inferior way to John Dalton, who was so ready at them, that, as Kate said, 'you might just as well tell papa at once.'

'I think drawing-room games out of doors are slow,' said Jeff decisively.

'But they can't make us slower than we are,' answered Jenny, 'since we have come to a full stop.'

'I shall be very glad to play at Lights, or anything else, to promote the general hilarity,' said Mr Holt modestly.

'That is a very large order, "the general hilarity,"' muttered Jeff to Jenny.

'It is not so much the promotion of hilarity, Mr Holt, as it seems to me,' said she, 'as the avoidance of utter collapse that we have to provide for. We have no idea (doubtless) how stupid we have been ourselves for the last half-hour, but everybody has noticed it in his neighbour.'

'I have not noticed it in you, Miss Jenny,' returned Mr Holt gallantly. 'I have only observed, as in Macaulay's case, that there were occasionally "flashes of silence."—What do you say, Miss Kate? Are you for games or no games?'

Kate did not like Mr Holt, but she had looked upon him with less disfavour ever since he had endeavoured to take the blame off Jeff's shoulders in the matter of the Guide Race; and she thought Jenny was hard upon the man. True, he was not quite up to the standard of 'a gentleman'; but that seemed to her rather a reason why they who were his superiors should deal tenderly with him. Moreover, she was resolved not to 'snub' him, ever since Mary had dropped that unpleasant hint about his devotion to her on the night of the charades,

lest her coldness should be laid to that account. Thus specially appealed to, she gave her voice for games, and they were commenced accordingly. Jenny and Mary had the word—though the two sisters would have carried on the conversation better—and the rôle of the rest was to listen.

'It is curious,' said Jenny, 'that you generally either see them in great numbers, or else only one at a time.'

'Nay,' returned Mary; 'I have often seen two and four of them, though seldom three, when their object has been to make us good.'

'Or perhaps only goody-goody, which is quite another thing,' observed Jenny.

'Mamma, however, believes in their efficacy implicitly,' said Mary.

'I hope so, my dear,' observed Mrs Campden, awakened by this reference to herself; and understanding dimly that she was called upon to endorse some moral or religious principle.

'I am afraid you have no right to join in our conversation, my dear Mrs Campden,' said Jenny.

'They are playing at Lights,' explained Kate apologetically.

'My dear Kate, I am perfectly well aware of that,' returned the hostess with dignity. It was a maxim with her not only never to own herself wrong but even mistaken.

'But you know you have not guessed it, mamma,' urged Mary; 'and it's contrary to the rules to talk to us unless you have.'

'Your mother does not even keep one of them in her house, I believe,' continued the audacious Jenny, whose character was faulty in this particular—that she had no reverence for those she did not respect. She was impatient of pretence of any kind, and would rap her hostess's knuckles as soon as she would have rapped those of anybody else. What business had the woman to insist upon it she was awake when she was asleep?

'No,' said Mary; 'we do not keep one at present, though we did so at one time.'

'Yes; that is very curious,' observed Jenny thoughtfully. 'The poor keep none of them. The moderately rich keep one of them. The rich keep none of them; but the very rich indeed—quite magnificent people, that is—keep lots of them.'

'This is like a riddle of the Sphinx,' exclaimed Jeff despairingly.

'And you are not the Calipus to guess it,' retorted Jenny. 'As it happens, however, it is not a riddle, though I have seen it in a charade.'

'And on the stage,' said Mary. 'They look lovely on the stage.'

'Yes; but I think the gentlemen admire them more than the ladies. I am sure if you were to appear as one, Mary, they would admire you immensely.'

Mary blushed and tittered; and Kate put in: 'They were very useful to ladies, however, in old times, were they not?'

'Who is this young person?' inquired Jenny, with icy gravity, of her coadjutor. 'Do you think she has a right to join in our private conversation?'

'Let us inquire,' said Mary.—'When were they useful to ladies, miss?'

'In muddy weather,' rejoined Kate, and thereby established her position. There were now three to carry on the talk instead of four.

'Have you ever known them to change colour?' inquired Jenny with a conical look.

'No,' said Mary. 'I have known them of different colours, but never to change.'

'Nor I,' said Kate. 'Give us further particulars.'

'Well, I have known those to which Mrs Campden is attached to be red, and yet occasionally not red.'

'Are they not often mentioned in romances?' inquired Mrs Dalton, smiling.

'Mamma has guessed it!' cried Kate delightedly. 'Well done, mamma!'

'I am not sure,' said Jenny severely. 'We must not encourage rash speculation. What writer of romance is mostly associated with them?'

'Sir Walter Scott.'

'Very true; yet he has not portrayed the most popular—and the largest—of all.'

'I have got it!' cried Jeff triumphantly. 'The largest of all is capital.'

'Who is this noisy youth?' inquired Jenny contemptuously. 'I cannot think he belongs to us.'

'Yes, he does,' persisted Jeff stoutly; 'the largest of all was apt to go to sleep a good deal.—Mr Holt has not guessed it yet.'

'If Mr Holt's literary sympathies were confined to a single book, as yours are, Jeff,' said Kate reprovingly, 'he would have guessed it as easily as you.'

'Oh, I see!' cried Mr Holt, forgetting his humiliation in the consciousness that Kate had been kind to him. 'I certainly ought to have recognised the Fat Boy.'

'I don't see it, now,' argued Mrs Campden, who, to do her justice, was seldom the last left in ignorance of the desired word. 'Of course a boy changes colour—though rarely, unless he's bilious; however much it may be expected of him, one never sees one bluish.' She never missed a chance of hitting at poor Jeff, but this time he had the advantage of her.

'The word is not quite "Boy," madame, though very like it,' explained he, with elaborate politeness; 'it is *Page*; which, when in the form of a tract, is occasionally *not* read. Moderately rich people keep *one*—'

'I don't think it's at all a good word,' interrupted Mrs Campden curtly. 'I think it stupid.'

'O mamma!' exclaimed Mary; 'I think it's an excellent word.'

'Uncle George, do, pray, come here,' cried Jenny, who, having herself invented the word, was by no means willing to submit to the voice of detraction. 'We want an independent opinion from you.'

'My dear girl, I have not possessed such a thing these twenty years,' replied Mr Campden, coming forward with his cigar.

Mrs Campden bit her lips, and so did the young people, though from a different cause. It was with difficulty that they restrained themselves from laughter.

'We want to hear your opinion of the word *Page* for *lights*,' continued Jenny. 'Do you think it a good word, or not?'

'It is not a bad word, so far as I know,' replied Mr Campden comically.

'Now, do be serious, Uncle George. Is it well chosen or ill chosen? Somebody says it's stupid.'

'I should think that was the person who had not guessed it,' observed the referee.

'Thank you,' said Mrs Campden icily. 'It appears to me that you have not learned politeness from the society of your stoker yonder.'

'Good gracious!' exclaimed the unhappy man, 'how was I to know that it was you, my dear? You are generally the very first to guess these things.'

'Please, either to put your cigar out, or to return to your friend in the engine-room,' was the uncompromising reply; 'ladies do not like tobacco-smoke puffed into their faces, Mr Campden.'

'On board steam-yachts, my dear,' rejoined he good-naturedly, 'smoking is always allowed, except abaft the funnel. Nevertheless, to hear is to obey; and with a salutation to his lady and master, intended to be eastern in its profundity, Mr Campden retired, only to reappear, however, in a few minutes, fresh and smiling, at the luncheon-table. Under the influence of good viands and champagne, the little company, which had been getting somewhat limp and out of spirits, soon revived. The great prescription for a water-party is what Dr Arzoon termed 'constant support'; a luncheon should be always going—and so far as the young people were concerned, the excursion, after all, proved a considerable success. Mrs Dalton's eyes, however, in vain swept the dreary moorland for her husband; he came not, and, her heart foreboded, was too sad to come. It never struck her, as it would have struck some wives, that he might have 'made an effort,' as she had done, and helped her to endure the happiness and laughter of the rest by his presence. Since he could not be merry, she was glad to think that he was spared the pain she suffered; but she pined to be with him, that her love might comfort him. What was he doing all alone at Riverside? Twice had Mrs Campden addressed her, though, it must be allowed, in a very low voice, without diverting her attention from this melancholy thought.

'My dear Edith, are you asleep?' said she at last, a little sharply.

'A thousand pardons, Julia. I suppose the motion of the vessel made me drowsy.'

'It must have made you blind as well as deaf, my dear,' whispered her hostess, 'if you have not noticed the very marked attentions that somebody has been paying to your Kate all day. Of course, she is well able to take care of herself, but, in my opinion, it is a piece of downright impertinence on his part.'

'I have observed nothing,' answered Mrs Dalton, her delicate pale face flushing in spite of herself. 'Are you referring to Mr Holt?'

'Well, I suppose I am not referring to Geoffrey, my dear—that would surely be a little too absurd. I say, considering the sort of footing on which Mr Holt has come down here—not, I must say, altogether with *my* approbation—as your husband's business-friend, it is most impertinent in him to presume in that way. We have every reason, however, to believe that Kate has a proper contempt for the man.'

'Well, I think we may be assured at least that Kate has not fallen in love with him,' said Mrs Dalton, smiling. She had quite recovered herself now, and would have been more than a match for her hostess on such a topic a month ago; it is true, she no longer felt on equal terms with her, but then the other did not know it.

'In love with him!' repeated Mrs Campden

scornfully. 'I should as soon have imputed to her an attachment to the footman.'

'Mr Holt is your guest, Julia,' returned Mrs Dalton stiffly. Her anger was not stirred upon Mr Holt's account at all, and Mrs Campden knew it, and drew in her horns at once.

'Well, of course the footman is an exaggeration, my dear; but the man has no sort of right to lift his eyes so high.'

'Of course, such a match would be ill-assorted,' returned Mrs Dalton. 'To begin with, there is a very great disparity in years.'

'Nay, that would surely be a trifling objection, compared with others. He is not on the same level in society, nor anything like it; while, even as to his wealth—there is no knowing, with these speculating people, whether they may not be beggars to-morrow; and it is no discredit to dear Kate, considering her bringing-up and reasonable expectations, if I say that she is totally unfitted for any other life than one of assured ease and affluence.'

'I hope that is not so,' said Mrs Dalton hesitatingly; and here it was almost upon her tongue to tell why it was she hoped better things of Kate, of the necessity that had arisen that Kate and all her children should fit themselves for quite another life than one of affluence; but her companion's impatience cut her short.

'O nonsense, Edith. I do sincerely trust you will never encourage her to throw herself away upon a poor man. Indeed, I know no one—except, perhaps, my own daughter—less likely to be happy with such. Of course, riches cannot insure contentment; but it is quite as certain that poverty, when it falls upon those who have been used to riches, produces discontent, peevishness, coldness of heart, and in the end, often downright dislike for those—even when they are not in fault—with whom we are compelled to live. There is a deal of nonsense talked on the other side of the question; but it is rather a suspicious circumstance that all the eloquence in favour of poverty comes from people who are either very rich, or not in a position to feel the want of money. You never hear a man with a large family, for example, preaching up the delights of a small income.'

'But when you had a small income yourself, Julia—or one comparatively small—you were just as happy as you are at present.'

It was now Mrs Campden's turn to blush, which she did very violently, though somewhat partially. She was one of those women who blush in patches, and especially on the forehead, the ears, and the tip of the nose.

'Of course, we have had our day of small things, Edith, as I have never sought to conceal; but that was before we occupied our present position in'—she was going to say 'the county,' but she modestly exchanged it for—'society.' Having once attained to that, it would be a great bitterness to fall even to the place that I once occupied, perhaps contentedly enough.'

'Yet, you would surely not dislike, on that account, those with whom you were compelled to live—your husband, for example—even though, as you put it, he might have been the cause of your calamity?'

'I honestly tell you, Edith, I should like him none the better for it; and should not certainly expect that Mary would have the same respect

for him. A man who, having once established himself and family, risks, I do not say their means of livelihood—for that would be downright selfish wickedness—but their (I know no other word for it) "position," by speculation, loses not only their money, but their dutiful affection and regard, and, in my opinion, deserves to lose them. Of course, Mr Holt yonder, with no family ties, may do as he pleases; but what would the world say of your husband, for example, if he allowed himself to be persuaded by him to enter into any dangerous enterprise?'

'Well, what *would* the world say?' inquired Mrs Dalton, looking quickly up into her companion's face.

'Why, they would say—some very hard things,' answered the other, not without some signs of discomposure. 'Even in a supposititious case, one would not like to say what things; but my point is, that though you yourself might forgive him, your children would endorse what would be said.'

'And, in your opinion, they would be justified in so doing?' asked Mrs Dalton coldly.

'In my opinion, they would at least be excusable, Edith. You are not annoyed with me, I hope, for speaking my mind. I am taking, of course, only a general case. I am quite sure Mr Dalton is the very last man in the world to commit such a piece of folly; but my argument is, that if any one in his position did commit it, it would be a crime.'

Here the *Mary* grounded, as she was accustomed to do, on every other trip, some yards from her proper anchorage in the river. Taking into account the interest of money sunk in the purchase, and the expense of her maintenance, each of these rare excursions to Bleabarrow mere cost her owner about five-and-twenty pounds. But his wife at least did not begrudge it. No family in the county could boast of the possession of a steam-yacht, except the Campdens.

'MYSTERIOUS SOUNDS.'

THE effect of certain sounds upon the mind is often very curious. We do not allude to the ordinary phenomena of speech, singing, and music, where the sound-producing apparatus is tolerably familiar, and its distance from the hearer estimated with a near approach to accuracy. The effect is only 'mysterious' when there is any doubt as to where the sound comes from, and how it has originated; the imagination then begins, and sometimes works itself up to very singular hallucinations. Night, or darkness without night, has much to do with this matter. When we cannot see the sound-producing agent, conjecture is apt to run wild; and ghost-stories often depend on no better foundation than this. For instance, certain sounds may frequently be heard at night, coming from the air above, but from an invisible source—a kind of whistling or prolonged cry, the producers of which are known in certain parts of England as 'whistlers.' Some legends make it out that these whistlers are ghosts, some evil spirits, some Wandering Jews. But the truth is, that the sounds proceed from birds, such as wild geese or plovers, which are in the habit of flying in flocks by night, either for the purpose of reaching distant feeding-grounds, or during their annual migrations. The cry which is usually uttered by

the 'leader' during these nocturnal bird-flights has, from ignorance of its cause, been regarded as weird and mysterious by superstitious folks, who associate it with impending evil.

Sir David Brewster gives an excellent account of a mysterious night-sound which would have frightened many persons, but which proved innocently harmless when tested by a steady observer. A gentleman heard a strange sound every night, soon after getting into bed; his wife heard it also, but not at the time when *she* retired, a little earlier than he. No probable cause could be assigned; and the effect upon the imagination became rather unpleasant. He found, some time afterwards, that the sound came from a wardrobe which stood near the head of his bed. He almost always opened and closed this wardrobe when undressing; but as the door was a little tight, he could not quite close it. The door, possibly affected by gradual changes of temperature, forced itself open with a sort of dull sound which was over in an instant. From the lady not being in the habit of using that wardrobe, the mystery became associated with her husband only. Many a ghost-story would receive its solution by a little attention to the sounds resulting from the expansion and contraction of wood-work, such as doors, panels, wainscoting, and articles of furniture. Heard at night, when all is still, the sudden creaking of furniture in a room is apt to be somewhat startling, until one comes to know that it is simply due to 'the weather.'

Sound being generally more audible at night than in the daytime, is often exaggerated by those who overlook that fact. Humboldt specially noted this when listening to the cataracts of the Orinoco, and traced it to differences in the humidity of the air. The atmosphere is sometimes more than usually transparent, and sometimes more than usually opaque, to sounds as well as to light; Dr Tyndall has recently proved this in a striking way, in relation to the audibility of fog-signals in different states of the weather. A little mystery is also due to the fact that we sometimes know that sound is being produced by an object visible to us, and yet we cannot hear it. The chirp of the sparrow is inaudible to some persons; others, who can hear it, cannot hear the squeak of the bat; and all of us are at the mercy of a kind of tone-deafness (analogous in some degree to Dr Dalton's colour-blindness), in regard to sounds of acute pitch. A singular case of visible but inaudible drumming occurred during the American War of Independence. English and American troops were drawn up on opposite sides of a river; the outposts were mutually visible; and the English could see an American drummer beating his tattoo, although no sound could be heard. This is attributed to a kind of tone-opacity which affected the air over the river in a particular state of temperature and humidity.

There is, to most of us, much mystery in sounds when louder than we expected to find them. A well at Carisbrooke Castle, Isle of Wight, has water at the bottom; and when even so small an object as a pin is dropped into the water, the sound can be heard above, although the well is more than two hundred feet deep. At St Alban's Cathedral, it used to be said, the tick of a watch could be heard from end to end of that very long building; whether the recent restorations have inter-

fered with this phenomenon, we do not know. Sound can be heard over water at a greater distance than over land; Dr Hutton heard a person reading at a hundred and forty feet distance on the Thames, whereas he could only hear him seventy feet off on shore. Sound can be heard over ice, also, more easily than over land. When Lieutenant Foster was wintering in the Arctic Regions, he found he could converse with a man a mile and a quarter distant, both being on the ice in Bowen Harbour. The human voice, it is asserted, has been heard ten miles off at Gibraltar—we presume, over the water of the strait. The whispering gallery at St Paul's is always a mystery to visitors; a whisper becomes distinctly audible at the opposite side of the gallery, but not at intermediate positions. The late Sir Charles Wheatstone once made a curious observation on sound at the Colosseum in the Regent's Park (recently pulled down). Placing himself close to the upper part of the interior wall (a circle a hundred and thirty feet in diameter), he found that a spoken word was repeated many times; that an exclamation appeared like a peal of laughter; and that the tearing of a piece of paper was like the pattering of hail. In the cathedral of Girgenti, Sicily, a whisper can be heard the whole length of the building, if the whisperer places himself in the focus of the semicircular apse at one end. A story is told that, long ago, a confessional box was inadvertently placed just at that spot; that the details of a confession were audible at another spot near the entrance to the church; and that the authorities were first made acquainted with this awkward fact by a ferment arising out of one particular confession.

Single sounds repeated many times, and a whole sentence repeated after a second or two, are alike mysterious to those who are not conversant with the scientific conditions on which they depend. Some recorded echoes are of very remarkable character. Those on and near the Lakes of Killarney are doubtless familiar to many readers of this sheet. At Woodstock Park, near Oxford, it used to be said that an echo would repeat seventeen syllables by day and twenty by night—a statement possibly in need of modern verification. An echo on the banks of the Lago del Lupo, near Terni, is said to repeat seventeen syllables; while the old topographers of Sussex told of an echo of twenty-one syllables in Shipley Church.

Many a mysterious rumbling, a trembling if not a booming, has been fairly attributed to distant cannonading heard over wide stretches of sea, and sometimes of land. Supposing the statements to be correct (which, of course, we cannot guarantee), many of the recorded examples are notable enough. The evening gun at Plymouth has been heard at Ilfracombe, sixty miles off. Rather more than this is the distance from Holyhead to Kingstown, near Dublin, a distance travelled by the audible sound of a salute from a fleet of war-ships. Cannonading off the coast of Essex has been heard at Cambridge; and off the North Foreland, at London—distances of seventy or eighty miles. The booming of great guns has been heard from Messina to Syracuse, from Genoa to Leghorn, from Portsmouth to Hereford—distances of ninety to a hundred miles. Great explosions of gunpowder, in powder-works and in magazines, are said to have been heard at distances nearly as great as these. Guns fired at

Carlsrona have been heard in Denmark, across the whole breadth of Sweden, a hundred and twenty miles off. At two or three places on the coast of Kent, it is said, the cannonading at Waterloo was heard—the distance being very considerably over a hundred miles. The terrible firing of the Federals and Confederates at the battle of Gettysburg, during the American civil war, made itself heard a hundred and thirty miles off; and it is even said that gun-firing at Stockholm was once heard at a distance of a hundred and eighty miles; and that cannonading in the German Ocean was audible at Shrewsbury, two hundred miles off. But if for cannonading we substitute the mightiest sounds of nature, great volcanic eruptions, we leave such distances far behind; Sir Stamford Raffles and other reliable authorities tell us that the tremendous volcanic eruption at Sumbawa Island, in the Eastern Archipelago, was heard *nine hundred miles away*.

There is often something very mysterious in sounds when we are deceived as to the direction whence they come, even when the sounds themselves are of a familiar kind; and if we are deceived both as to direction and distance, the mystery grows in interest. One of the best examples of this was the exhibition known as the *Invisible Girl*, pleasing in itself and scientific in action. In the middle of an exhibition-room was a small globe of copper or brass, suspended by strings or ribbons from a canopy, and in contact with nothing but those ribbons, except that four trumpet-mouths opened from the four sides of the globe. On speaking into one of these mouths, and asking questions, a tiny voice answered from the globe itself, speaking in three or four languages, according to the requirements of the question, and singing at intervals. The globe was only a foot or so in diameter; but so completely did the voice seem to come from it, and so delicate and subdued was it in tone, that the effect produced upon the audience was striking. The mode of producing the sounds was scientifically complete. A framework that surrounded the ball had an air-tube along one horizontal bar and down one leg; when a spectator spoke or whispered into one of the trumpet-mouths, the sound was echoed by the hollow of the globe back into the concealed tube, and conveyed into an adjoining apartment, where they were heard by a lady-confederate, who whispered back the answer. We remember the exhibition, and can vouch for the fact that the voice seemed to come from a tiny being located in the small globe itself.

It has been pretty well ascertained, in regard to mysterious sounds coming from masses of stone, that the sonorous effects admit of a scientific explanation. At Solofara, near Naples, when the ground at a certain spot is struck by throwing a large stone against it, a peculiar hollow sound is distinctly heard. This, it is believed, is due to one of three causes: there are large cavities beneath, or there are partial echoes in the porous stone, or there is a reverberation from the surrounding hills. Humboldt describes a granitic mountain in the Orinoco region as 'one of those from which travellers have heard from time to time, towards sunrise, subterranean sounds resembling those of an organ. The missionaries call that stone *lozas de musica*. "It is witchcraft," said our young Indian guide. The sound is only heard when a person lies down on the rock, with his

ear close to the surface.' Humboldt expressed a belief that the rock contains a multitude of deep and narrow crevices; that the temperature of the crevices is different from that of the open air; that a sonorous current slowly issues at sunrise; and that the sound is probably due to this issuing current striking against thin films of mica in the granite. Near Tor, in Arabia Petraea, is a mountain which gives forth a curious sound. A legend is current among the natives to the effect that a convent of monks is miraculously preserved underground; and that the sound is produced by the *nakos*, a long metallic bar suspended horizontally, which a priest strikes with a hammer to summon the monks to prayers. A Greek is even said to have seen the mountain open, and to have descended into the subterranean convent, where he found fine gardens and delicious water: and in order to give proof of this descent, he produced some fragments of consecrated bread, which he pretended to have brought from the underground convent! Seetzen, the first European traveller who visited this spot, played sad havoc with this imaginative picture. Accompanied by some Greeks and Arabs, he found a bare rock of hard sandstone, inscribed with Greek, Arabic, and Coptic characters. He came to the conclusion, on close examination, that the surfaces of two inclined planes of sandstone are covered with loose disintegrated sand; and that this sand, in gradually rolling down, produced a sound like the swelling and waning tone of a humming-top.

Perhaps the most familiar of mysterious sounds are those produced by the ventriloquist; familiar because almost every country fair is visited by one or other of these exhibitors; mysterious, because the real source of sound does not correspond with the apparent. It lies within the province of the anatomist or physiologist to explain how it is that some men can speak as if from the stomach instead of the throat, and without any perceptible movement of the lips; but the person who can do this, the ventriloquist, may make himself a most bewildering deceiver of those who listen to him. Our power of determining the exact direction whence a sound comes is less than we usually imagine. It is said that Saville Carey, who could well imitate the whistling of the wind, would sometimes amuse himself by exercising this art in a public coffee-house; some of the guests at once rose to see whether the windows were quite closed, while others would button up their coats, as if cold. Sir David Brewster notices a ventriloquist of exceptional skill, M. St Gille, who one day entered a church where some monks were lamenting the death of a brother; suddenly they heard a voice as if from over their heads, bewailing the condition of the departed in purgatory, and reproaching them for their want of zeal; not suspecting the trick, they fell on their faces, and chanted the *De Profundis*. A committee, appointed by the Académie des Sciences to report on the phenomena of ventriloquism, went with M. St Gille to the house of a lady, to whom they announced that they had come to investigate a case of aerial 'spirits' somewhere in the neighbourhood. During the interview, she heard what she termed 'spirit-voices' above her head, underneath the floor, and in distant parts of the room; and was with difficulty convinced that the only spirit present was the ventriloquistic voice of M. St Gille.

Brewster tells of another master of this art, Louis Brabant, valet de chambre to Francis I., whose suit was rejected by the parents of a beautiful and well-dowered girl with whom he was in love. He called on the mother, after the death of the father, again to urge his suit; and while he was present, she heard the voice of her deceased husband, expressing remorse for having rejected Louis Brabant, and conjuring her to give her immediate consent to the betrothal. Frightened and alarmed, she consented. Brabant, deeming it desirable to behave liberally in the marriage-arrangements, but having not much cash at command, resolved to try whether his ventriloquism would be as efficacious with a money-lending banker as it had been with the widow. Calling on the old usurer at Lyons, he managed that the conversation should turn upon the subject of demons, spectres, and purgatory. Suddenly was heard the voice of the usurer's father, complaining of the horrible sufferings he was enduring in purgatory, and saying that there was no way of obtaining alleviation except by the usurer advancing money to the visitor for the sake of ransoming Christians from the hands of the Turks. The usurer was terrified, but too much in love with his gold to yield at once. Brabant went next day, and resumed the conversation; when shortly were heard the voices of a host of dead relations, all telling the same terrible story, and all pointing out the only way of obtaining relief. The usurer could resist no longer; he placed ten thousand crowns in the hands of the unsuspected ventriloquist—who of course forgot to pay it over for the ransom of Christians either in Turkey or anywhere else. When the usurer learned afterwards how he had been duped, he died of vexation.

Of all producers of so-called mysterious sounds, Dr Tyndall's sensitive or *vowel flame* is one of the most curious. Out of a particular kind of gas, with a burner of peculiar construction, the learned professor produces a lighted jet of flame nearly two feet in height, extremely narrow, and so exquisitely sensitive to sounds that it sings, and dances up and down, in response to everything that is sung or said, with different degrees of sensibility for different vowel sounds. 'The slightest tap on a distant anvil reduces its height to seven inches. When a bunch of keys is shaken, the flame is violently agitated, and emits a loud roar. The dropping of a sixpence into a hand already containing coin, at a distance of twenty yards, knocks the flame down. It is not possible to walk across the floor without agitating the flame. The creaking of boots sets it in violent commotion. The crumpling or tearing of paper, or the rustle of a silk dress, does the same. It is startled by the pattering of a rain-drop. I hold a watch near the flame; nobody hears its ticks; but you all see their effect upon the flame; at every tick it falls and roars. The winding-up of the watch also produces tumult. The twittering of a distant sparrow shrieks in the flame; the note of a cricket would do the same. A chirrup from a distance of thirty yards causes it to fall and roar.' In reference to the power of the flame to respond to poetry, the lecturer said: 'The flame selects from the sounds those to which it can respond; it notices some by the slightest nod, to others it bows more distinctly, to some its obeisance is very profound, while to many sounds it turns an entirely deaf ear.'

So long as the cause of any unusual sound is

unexplained to the non-scientific listener, he is apt, naturally enough, to term that sound mysterious; but the element of mystery will disappear when he is assured that sounds of every description are due to natural and unalterable acoustic principles.

AN OLD LOVE-STORY.

IN THREE PARTS.—PART II.

It would be too tedious to put down on paper many of the incidents of Willy's life and mine at this time. Nothing seemed to happen for several years after the accident to little Miss Joy and Willy in the lane. Our life—now that I look back on it through the mists of half a century lying between—seems to have been a time of young animal happiness—a life of young colts or of dogs. We seemed to live on the outside of life, as it were. I remember we used to listen to our elders talking over politics or the fighting news, as if it did not concern us at all. I remember the war-news well, because Bill Stubbs was in the habit of coming over and sitting in the mill kitchen every Saturday evening, to hear the newspaper read to him by Uncle Stephen, and to be reproved for his hearty cursing of the Duke of York. The old man used to stomp up and down the floor when some of the news was read. As for Uncle Stephen, he always used to read the unfavourable news as if it were a pack of lies, never giving way to agitation, as old Bill did.

Willy was the first to take notice of these matters of war and politics, although I was fourteen at the time, and he only twelve; but he was always quicker than I was, and always met the disagreeableness of arithmetic more cheerfully than I could, when he was not excited by old Snuffy Tegg. I had a sad dull head, and have still, for the matter of that; but I was tough of limb, and could run across stubble like a greyhound, and could swim against the mill-race, which no other boy in our parts could do. But Willy was always pale and slender, with a face as sweet to look upon as a picture or a flower. The ladies from the Hall noticed him more and more, although we were forbidden by Uncle Stephen to go near the squire's grounds. But we frequently met parties of the gentry about the lanes, and we learned at last to stand fire as it were, and left off running away when we saw them coming. Miss Joy was always in high glee whenever we met, and one day she gave us one of her doll's children, which were carried in a basket behind her. She told us to share it between us and be very good to it. I carried it home carefully, for Willy had rather a contempt for it; and it lies, even now, in a safe place, with a scrap of paper to it, on which is written, *A Present from Joy*. The paper is very old and yellow, and the doll is no longer young; but my youth comes back to me afresh when I look at it, and to part with it would be losing part of my life.

But there came a time with Willy and me when we had our first great trouble; and our sore hearts took in, for the first time in our lives, the great fact that cruelty and hardness—so it seemed to us—were not only to be found greatly developed in boys, but in their elders also. It seemed a great blow to us to discover this, and it swept away like cobwebs whole chapters of catechism. It was

in the year 1800, and when the day came, it brought with it the astonishing news, that Willy was not only a grandson of Uncle Stephen, but of Squire Harding also, and heir to his great estate. I well remember hearing all about it in the mill parlour, when Willy was called in, and I, as usual, went with him, and sat unnoticed and forgotten for the time during the interview between Uncle Stephen and Mr Harding. The miller sat by the window, resting his head upon his hand, and looking out very sadly, I thought, and slightly turned away from Mr Harding, who sat at the table with a packet of foreign-looking letters near him. They seemed to have been sitting in that way for some time; but when we entered, Uncle Stephen spoke to Willy, and made him sit on a chair close by him. Mr Harding nodded to Willy, and smiled and shook hands with him; whilst I seated myself near the squire's dog Sancho, at a little distance off; for, thank goodness, I have always, man and boy, known my proper manners in the presence of the quality; although, when Willy became a gentleman, heaven knows, it was hard to bear.

'How old are you now, Willy?' asked Mr Harding.

Willy confessed to thirteen.

Uncle Stephen sighed, and Willy, who misunderstood him, ran to the large Bible to prove it, and there stood the entry, in Uncle Stephen's firm bold writing: 'WILLIAM CUTHBERT BRAND; born at Calais, July 1787.' The entry immediately above was partially obliterated, as if it had been scratched out and written in again. It was the record of the birth of Uncle Stephen's daughter, Willy's mother; and against it was written on the edge of the page the words: '*Dead. God forgive me my anger, and her*—' The sentence was incomplete.

Uncle Stephen took the open book upon his knee, and drew a pen through the word *Brand*, and wrote *Harding* instead—the squire looking on. Then he closed the book, and clasped it, and the hand he laid upon it trembled. I wondered at that, and the unusual paleness of his face and his tight lips as he looked at Willy. But Uncle Stephen was never a man of words; and I have since known, that in that action of a moment he had surrendered the dearest object in life, for he cherished Willy as few have a son; more than Willy ever knew, for, as I have said, he was a silent man, who seldom gave utterance to the deep feeling that belonged to his nature.

The squire entered into conversation with Willy with all the pleasantness of the open-hearted gentleman that he was; and he and Uncle Stephen told Willy between them, bit by bit, all that it was necessary for him to know of a very sad story.

I knew it all very well in after-years, when Uncle Stephen began to treat me as a man; but at that time it had been agreed to make Willy alone understand that he was the only son of Mr Harding's only son; and that the time had come when he should leave the mill, and live at his own proper home at the Hall for the future.

'Shall I have a pony, like Miss Joy?' he said, when all had been made clear to him.

'That you shall, my boy,' replied the squire, smiling.

'Hurrah! Ride about, never go to school any more! Good-bye, old Snuffy Tegg!' he cried,

capering about the room, for he had quite lost all fear of the squire.

The squire laughed aloud; but Uncle Stephen looked at Willy very sadly and wistfully, I thought, as he sighed again.

I felt a passing lifting up of the spirits at all this, but my heart sank again directly, as I had heard them arranging to take Willy away to the Hall to live, and I knew that I should scarcely see him any more; and in imagination I saw him riding by with Joy, whilst I looked forth at them from the dusty grinding-room of the mill, riding past—away out of my life for ever. I forgot my good manners for a moment, and moaned out aloud before them all. Then I rushed out of the room, and away down the river-side to the meadow, and there I threw myself upon the grass, and cried out my heavy grief with hot tears. The cows were mousing the grass all around me, and now and then they lifted their clumsy, honest heads and stared at me; and now and then I could hear the faint tinkling of the sheep-bells on the heathy hills, and the familiar noise of the mill, and I began to think of the happy times we had had together, till my head ached with weary pain. By-and-by, I heard Willy's signal-whistle, and I answered it very feebly. He came jumping over the stile and down the meadow to me, holding up two large silver coins that the squire had given him. He gave me one, for we had always shared everything; but he afterwards took it back and gave me the other, although they were both alike. Then he said how fine it was to be rich; and putting his hands in his pockets, he said suddenly: 'Hollo, Ned, you've been blubbing!' The tears, in spite of me, began to shew themselves again; and Willy looked serious, and very soon his under-lip gave way. We sat down on the bank of the river and sniffed a good deal, both of us looking straight down into the water rippling past at our feet. But a consoling thought struck me, and I said: 'Let us go and tell old Bill.'

Bill uttered a long whistle when we told our news; a whistle that would have been shrill in most men. But Bill Stubbs had the pipe of a mavis, and his whistle, though astonished, was sweet. He looked at Willy very kindly, and said he hoped he would do honour to the quarter-deck. Willy did not seem to trouble his mind much about that. His thoughts at that time, I think, ran chiefly on ponies. Indeed, after a time, he took everything that happened to him in a matter-of-course sort of way which greatly surprised me, it was so little like what I expected of him.

Willy was recognised by all the squire's family and friends, and before long was sent to a public school in the south; and when I think of the time when he left the old mill and Uncle Stephen so easily, I feel a heavy weight on my heart to this hour, so deep was the impression it made on me.

I had resolved to be a miller like Uncle Stephen; but the glory of it was gone. A shadow seemed to have fallen upon the dear old mill, and I could see nothing beyond but dullness. Willy told me he was precious sorry to go and leave me behind, and advised me not to be in the dumps about it. 'Here are lots of things I shall not want any more,' he said. He also gave me his little brown terrier, Tuck, to keep for him, and cried over it, for his heart was good, although he did not seem to know it himself.

Uncle Stephen, I remember, scarcely spoke to any one at that time. He went about and did as he had been used to do, but I could see the deep sadness in his eyes.

I saw very little of Joy Harding for the next four or five years, or of Willy either, for I had become a miller, and my business was to grind corn, and not to hanker after the footsteps of the quality.

Willy became a gentleman with the greatest ease, and I was prepared to find him proud and haughty when he came home from school the first time; but he was not. He came to the mill several times, and brought Joy with him. He looked very grand in his new clothes, which fitted him without shewing creases to hold the dust, as mine did. He gave Joe Blake a guinea, which Joe hid away among the rafters of the granary, but afterwards begged Uncle Stephen to keep for him, as it made him uneasy at nights, and caused him to visit it with a lantern.

Joe Blake said Joy was an angel from the sky, and, to this day, I think Joe Blake never said a truer thing than that. Joe was troubled in his mind about it that day, for he thought it might be impossible that such as he should be allowed to sit down in the kingdom of heaven with the like of Joy Harding. But George Hawkes, our other man, who was a Methodist, laughed at this simplicity of Joe, and said that all would be equal there. Joe called him a downright fool to talk so, and asked him how many more there were like him in the parish of Tadcaster, where he was brought up, and if book-learning and manners, which belonged to the gentry, were to count for nothing. Indeed, there was almost a quarrel between the two, when I interfered, and told them that it was presumption of them to settle matters beyond their understanding, and that these things were only to be explained by the clergy. This satisfied Joe, but not George.

As time went on, Willy became more and more of a young gentleman, until Joe Blake and I got into the habit of saying 'Sir' to him so naturally, that Willy did not seem to notice it a bit. He did not come so often to the mill; but when he did come, Joe and I were as pleased as if the prince of all the realm had looked in upon us to sit upon a sack of grain, and tell us of his goings-on among great people. We heard many things that astonished us greatly. Uncle Stephen was never much in the way at these times, but he always seemed pleased to hear that Willy had been to see us.

Joy, after she got to know Uncle Stephen, came often by herself to the mill to talk with him; indeed, she became a constant visitor; and I could see he had a high regard for her. We all treated her as a fairy princess, and whoever amongst us held her pony was happy. I astonished Joe Blake one day by kneeling down upon one knee in the mud, and asking her to place her foot upon the other, to help her to mount. Willy was with her that day, standing by and sucking the ivory head of a new riding-whip. He said it was quite right, and very well-mannered of me, and laughed at his cousin for declining, and offering me her hand instead. I was in a fog of delight all the rest of that day, and my cheek, which her long fair hair had just touched as she mounted the pony, tingled and burned even all through the night, in my dreams. We all thought what a fine pair they

would make as they rode off together; and as Joy waved her hand to us at the corner of the lane, Joe Blake came very near breaking his neck from the high door of the grinding-room.

I saw Miss Joy Harding continually after this, and talked to her chiefly about Uncle Stephen and Willy. She liked especially to hear about the miller, and her lovely bright blue eyes used to soften wonderfully with sympathy as I told her how good he was. One day she confided to me that she meant to make her grandfather at the Hall and Uncle Stephen bosom-friends before long, as they ought to be, so good as they both were; and she said she wanted me to assist her. I told her I would, and that I would throw myself over the great water-wheel, to please her. She laughed, and I remembered afterwards that she blushed also. Then she said we could talk about it another day, and cantered away on her pony. But when I came to think of it, I could not see any way by which I could help her in the matter, unless there should be any carrying to do or wrestling, for I was by that time a full-grown man, and thought twenty-stone bags of grain were feather-weights. But my brain had not improved with my body, and I found myself forgetting much of my school-learning, remembering best of all the untold weltings I had achieved from old Snuffy Tegg's cane.

When I saw Joy again, I begged her to ask Willy also to assist her in her plan, for he was clever and related by blood to both of them. She made no reply at once; but after some hesitation, she said she had asked him, and he had only laughed and said things were all very well as they were. 'He is so indifferent,' she said, half-crying, 'and doesn't care, except about dogs and horses. He says all the poor people in the village are as bad as can be, and very mean and greedy; and that when he is squire, he will make them look two ways for Sunday.—What does he mean by "two ways for Sunday?"' she asked, looking anxiously up in my face.

I confessed I didn't know the meaning of it, but that it was one of the sayings of old Bill Stubbs; and I assured her that Willy did not mean anything wrong.

Then she wanted to know who Bill Stubbs was, and how he happened to make use of such a curious saying.

I told her I did not know how Bill had invented the phrase, except that it was natural for him to say queer things. Then I told her all about Bill, and what a hearty old fellow he was—his wonderful gift of story-telling, and the good songs that he sang; and how, above all, he whistled so purely, that the thrushes in Deeping Wood could not equal him for mellowness.

'Does he go to church?' she asked.

I was obliged to confess that he did not, on account of an invincible dislike of our good parson, Mr Moosey, who had offended him by objecting to his whistling by the river-side of a Sunday evening.

She was distressed at this; but after thinking a moment, she said, with one of her bright, blessed looks, that she would try to make them friends. 'Mr Moosey is a good man,' she said, 'and I am sure he will look after Sailor William, and make him good as well as mellow, for grandpa says he looks well after his tithes.'

Then I told her of Bill's Saturday afternoon visits to the mill, and how hard it was now for him to get there, as he was growing old and stiff.

She said she would come too; and so she did, the very next Saturday; and Uncle Stephen introduced our old friend to her, and said he was one of Admiral Duncan's men. The old sailor rose from his seat, and made his best manners to her, and she shook hands with him; but I could see that she was unprepared for the wooden leg, which I had omitted to mention.

I was disappointed in Bill that day, for his wits seemed to have left him, poor fellow. I expected him to have been full of anecdote and music, but he had neither within reach, only an uncomfortable look on his jolly face. I was quite vexed with him, until Uncle Stephen drew him out, as indeed he always could, when no one else could, and helped him to feel at home with Miss Joy, who set herself to win his heart, and won it, as she did the hearts of all who knew her. He told some of his yarns, but left out all the best bits that used to amuse us so much. But Joy was delighted; and Uncle Stephen said he did very well; and the tears came to all our eyes when old Bill sang the *Young Midshipman's Grave*.

Joy asked him if his parents were broken-hearted when he ran away to sea.

'Bless you, no, miss,' he said; 'they was jolly glad to get rid of me.'

'But Bill never was a bad boy,' said Uncle Stephen, with a twinkle in his gray eyes.

Joy told us that day, before she left, that Willy had got a commission in a marching regiment; and this news made Uncle Stephen start, for I found out afterwards that he had not been consulted in the matter, and that he had, besides, a great dislike to officers. Indeed, he told me the full story of his great grief a few days after that. How that Willy's father, the squire's son, was an officer, and had run away with Uncle Stephen's only daughter, who was the pride of all the country round; and that her mother's heart had been broken by the dreadful affair; and that when his daughter died some time afterwards in France, poor Uncle Stephen was almost insane, and would have taken his own life, but that my father prevented him, and stood by him in his sore need, comforting him and nursing him through a severe illness; and that, when he became almost well, the boy Willy was placed in his arms, a small, delicate infant, having been brought away from the scapegrace father by no less a man than Mr Harding, who had quarrelled with his son for the disgrace he had wrought. But it afterwards appeared that but for the old squire's violence at the interview he had with his son at Calais, the real truth would have been told, instead of being brought to light thirteen years after, when the captain died abroad, and left his papers sealed and addressed to the old squire; one of which was the official record of the marriage between the parents, a few hours before Willy was born.

By what fate it was that, at that time, and all through a long delicious summer, I met Joy Harding so often without intending it, and how it was that my heart thrilled so at her presence, I knew not then. In the lanes, with a word or two exchanged, generally about Willy. At church, when she came down the aisle past our pew

with the squire. I read the *Voyages* of Captain Cook; but I never found much assistance in them. Still I persevered, and learned at last to like study of an evening, after the business of the mill was over. I told Joy of it, and she said it became me well; although it was not then, but long after, that I found she also read Cook's *Voyages*, on hearing from me of that wonderful book. But the more I read, the more I began to see the enormous deal I had still to find out in the world; and the hill of Knowledge seemed to grow greater the more I strove to gain a little footway up it.

I had not seen Joy for a year or more, as she had been up in London so long that it seemed to me as if Time and Space had made a bond to shut me out from the sight of her for ever and aye. But one day I met Willy and her in the lane, quite unexpectedly, and, as my whiskers had grown, they scarcely knew me. I passed with a respectful salute, when Joy cried out: 'Why, it is Edward Thane!' and I could not help going up to her.

Willy greeted me also, but his greeting was not kindly, and seemed, to me, not from the heart. I was pained by it, and sorely puzzled; for surely, thought I, I am still Edward Thane. I remember he looked like a prince, with fine rings on his fingers, and chains at his breast. I admired him greatly, in spite of my disappointment, and thought how worthy he was to hold his own with the best in the land, and even to be the husband of Joy Harding. Indeed, it was a common report that they were to be married in a year, so that the estates might be kept together.

I can scarcely bring myself to write down the tale of my life—the events that befell just after this time—even now, after so many sad years have gone. And yet, whenever I set myself to do a thing, I have no rest till it is done. I fear I was greatly to blame in what happened, although Willy generously blamed himself. It was in the hunting-time, when Willy was at home on furlough, that I met him one cold, damp night in the great drive that leads up to the Hall. He was riding in late from a day's hunting, and very tired he looked, poor fellow! I had been wandering about the squire's grounds, as I often did at that time. In whatever direction I walked, somehow or other my steps were led at last to the shrubberies; and very often I stood there under the stars for hours, watching the lights of the Hall, as if the place had charmed me out of all propriety. Very well now do I know the charm that drew me there, for the magic influence was at work even then, that sanctified my after-life with a blessing beyond estimate and beyond price. But, in my ignorance, I dreamed away the time, and never knew at all of my presumption, nor of anything wrong in wandering about the place. But on the night I speak of I was rudely awakened from the dream, and the waking was cruel. As I said, I met Willy coming on horseback at a walk up the broad avenue. He stopped when he saw me, and we recognised each other, and I felt the pleasure I always had in his company, although of late there had been estrangement between us. I would have greeted him warmly, but with respect, as was proper to a greeting between the squire's son and me; but the words he spoke were so uncalled for, and the tones of them so strange and cold, that my respectful greeting faltered on my lips.

'What do you do here, Edward Thane?' he said. I had no reply to this. I was unprepared for it. I stood still, and stared at him in amazement; and then I asked him what he meant by thus accosting me, for it seemed to me as the utterance of a madman rather than that of a sane person.

'You know well what I mean,' he replied, with an oath. 'Why do you come here sneaking at nights? Do you think my cousin cares for such as you?'

'Your cousin!' I said, in wonder; and even then I could not grasp his meaning, and did not think of Joy.

'Yes, my cousin!' he exclaimed, excitedly. 'Do you think I have not watched your scheming and blackguardly attempts to gain her affections?'

I felt the hot blood at last in my face, and my inmost soul was sick with shame and anger at the insult; and in the midst of it all, a terrible gush of pain from the heart seemed to choke me. It was more than I could bear; and I answered hotly, forgetful of everything—even of the regard I bore him—I gave him the lie; and the sound of my voice seemed so unnatural when I said it, that I was appalled by it. He swore at me and struck at me in the darkness, and his whip fell heavily upon my face. Then I knew not well what I did, for I was beside myself with rage. His horse seemed to start and rear; there was a scuffle, and when the madness of the moment left me I was standing over him in the roadway, and he lay bleeding and senseless on the ground. The horse in the meantime galloped off, and very soon a noise of voices and the tramp of men coming with lights aroused me from my horror. They came and bore him up to the Hall, and I followed behind them, stupefied and overcome with deepest anguish at the deed I had done upon him of all others. The grooms had no thought but that he had been thrown; and indeed, nobody questioned me in the matter, for they were all too intent on restoring him to life again.

I hung about the Hall until I heard that he was in no danger, but only stunned by the fall, and it made my heavy heart a little lighter. But the other awful thought came in the place of the intense anxiety, and it was even worse to bear. I saw at last the fool's garden of pleasure in which I had been straying. I knew that I loved Joy Harding, so that it would be death to me to pluck her dear image out of my heart, and a burning sense of hopelessness seemed to wither the strong life within me. I wandered about the fields and woods like one demented, and moaned out my grief and despair; and at last I sank down upon my knees under the open sky, and my sorrow went forth from my lips in many wandering and passionate words. I went home with a set resolve, that, regardless of everything, I determined to carry out. I went up to my bedroom and wrote out a letter to Uncle Stephen, telling him all that had occurred between Willy and me, except the blow he had struck me. I told him I had forgotten myself in my wicked anger, and that there had been a bitter quarrel between us. Also, I told him the cause of it, and how true it was that, unknown to myself, I had for long entertained a desperate passion for Miss Joy Harding; so much so, that I could not bear to stay near the place any longer after I knew the painful secrets of my own erring heart. So I bade him farewell, and entreated God to bless

him for all his goodness to me. This I wrote with tears, for it gave me a sharp pang to think that I might never look on his kindly old face any more in the world. After I had finished this letter, I did not hesitate a moment, but left the house, and before daybreak I was miles away.

In a town some thirty miles off there was a sort of fair going on, and I walked about the narrow streets and crowded market-place with a feeling of fearful loneliness creeping over me. I stood to listen to a man making a shabby speech, at which the countrymen and girls were laughing and applauding. I brooded over the thought in my wretched half-insanity, and I took a sort of feverish pleasure in my most pitiable weakness and foolish despair. I nursed a new feeling of selfish pride and disbelief in all goodness and truth. All that was really bad in me seemed to come uppermost, and I made the most of it; the devil helping me to welcome the evil thoughts that took possession of me, even whilst they made me shudder in entertaining them. I was in this unhappy frame of mind on the day of the fair, and, of course, a recruiting sergeant was one of the first to notice it. I made up my mind that I would enlist and go to the wars, and if possible get shot in a forlorn-hope. I took the oath before a magistrate, and the sergeant wished me to drink with him, and told me I should soon be an officer like him. I thought him very kind, but I had no heart to make merry; although the sergeant's demeanour, I must say, was the reverse of merry after he had conducted the others and myself to the quarters of the regiment; for he then became as haughty as any general could be.

I was not long with my future comrades before I found that I disliked most of them, and I wondered very much where all the glory came from that we were told so much about in the newspapers. Hardly one of them but would have been despised in our village. But I had chosen my lot, and I determined to abide by it, although many a weary fit I had at first, for I was slow at drill, and the drill-sergeant seemed to be a master in the shape of a loud-voiced blasphemous man.

TRAIN-SIGNALLING BY TELEGRAPH.

THE deep and wide-spread interest excited by the frightful catastrophe on the line of the Great Northern Railway at Abbot's Ripton, and the statements which have subsequently been made at the inquest and Board of Trade inquiry into the matter, have induced the writer to believe that some details as to the methods of signalling trains by telegraph would be well received by the public. In these days of rapid railway travelling, everybody, with but few exceptions, entertains a tolerably plain conviction that the progress of each train is recorded by means of the telegraph, but—as a matter, almost of course—there are very few persons indeed who have any acquaintance with the details attendant upon the process. It is, perhaps, only when the nation is thrilled to its very core by some fearful accident, that public interest is awakened in the matter. At other times, people are fully content to travel as fast as steam can hurl them along, and

grumble most inconsiderately if but the slightest delay hinders their arrival at the specified time.

On every line of railway in this country the telegraph wires 'run' alongside the rails, and are with almost equal universality utilised by the railway companies. All these companies are in the habit of exchanging telegrams with each other in an almost incessant manner. A passenger has left his portmanteau, we will suppose, on the platform of King's Cross station in the hurry of catching the North express, and he does not find out his loss until he has to change into a branch-line train at, say, York. He complains there to the station-master, and mildly insinuates that the missing article was left behind owing to the negligence of the London officials. Straightway the telegraph is set to work; the message goes to London on the railway wires—not on those belonging to the post-office—with the prefix D.B.; and under ordinary circumstances, the portmanteau arrives by the next train after the receipt of the telegram in London. Then, again, trucks of goods go wrong; they get astray at junctions, owing to the carelessness or other fault of the shunters, and have to be 'wired' after in hot haste—especially if the goods they contain are of a 'perishable' nature. These inquiry telegrams, in important instances, are frequently sent to scores of stations, and are often altogether futile. Sometimes the missing wagons may be hidden amongst hundreds of others, and cannot be 'traced,' owing to the erroneous 'taking' of their numbers by the number-takers, who are perpetually on duty at every junction and at all the principal stations on every line of railway.

Let us, however, trace the progress of any one passenger-train, say from London to Manchester. Take the case of the fast express which leaves King's Cross for Sheffield, Manchester, Huddersfield, and Liverpool, at five o'clock every afternoon, Sundays included. This train stops first at Peterborough, after a long run of seventy-six miles, for which one hour and thirty-five minutes are allowed on the time-bills. It 'slows' in passing through several important stations and junctions, such as Hitchin, Welwyn, or Huntingdon; but when on the clear 'road' between stations, it averages fifty miles per hour. As soon as it has steamed clear of King's Cross platform, an inspector reports the exact time at which it has departed, to the telegraph office, where a book is kept for the sole and special purpose of entering these train telegrams. Every arriving train is entered by the telegraph clerks, and each departing one by the inspector, with a subsequent memorandum by the telegraphist, to intimate that it has been duly signalled. Every train, it should be stated, has its proper distinguishing number.

The train, then, has started, and has been duly and promptly reported in the manner just indicated. The telegraph clerk, supposing there to be no message in course of transmission on the circuit, at once—or if there be telegraphing in progress, waits two minutes, and then breaks in with the not-to-be-disregarded signal of M.T. (which means Train Message, the initials being reversed)—'calls up' Hatfield, Welwyn, Hitchin, Huntingdon, and Peterborough in succession, and informs them that number so-and-so down express left at such a time. At each of these stations the fact is promptly recorded, as there are anxious station-masters, inspectors, and drivers of goods-trains eager to know 'how the

expresses are running,' in order that they may regulate their own course of conduct, and get as far on their journeys—in the cases of the goods-trains—as is consistent with safety. As soon as Peterborough has received the signal from Hitchin that the express—the progress of which we are now following—has passed that station, the signal is sent northwards from Peterborough to New England (where there is a network of rails, and always a waiting host of goods and mineral trains), Essendine (the junction for Stamford), Grantham (for Nottingham, Lincoln, &c.), and Retford.

In the meantime, after the express has passed Hitchin, the stations each send telegrams forward to their next neighbours, but none further than Peterborough. When the express leaves that busy railway centre, say at 6.40, the signals are *again* sent thence to the places already named, which are north of Peterborough; and a similar process is gone through at Grantham and Newark. As soon as Retford receives the signal giving information as to the time the train passed Newark, the clerk gives Sheffield an intimation of the fact. Again, when the Manchester, Sheffield, and Lincolnshire line is entered upon at Retford, the signals are forwarded to Worksop, Kiveton Park, Woodhouse Junction, and Sheffield. The stations intermediate between Retford and Sheffield merely have the fact made known to them for the respective guidance of each; but as soon as the clerk at Sheffield knows the time given by the Retford signals, he is to forward it to Penistone (junction for Huddersfield, and where the Liverpool portion is generally detached), Godley Junction (where the Liverpool changes used to be generally made), Guide Bridge, and Manchester. When Sheffield is reached, and departed from, these stations are again informed of the exact time of departure; as also are Oughty Bridge, Wortley, and Dunford Bridge, which are small roadside stations.

Thus far we have traced the progress of our train broadly and in a sketchy sort of manner; but we must not lose sight of the far more important fact, that along the whole system of the Great Northern line which has been thus dealt with, the block-system has been more silently at work—silently, but far more surely and safely than what is technically known as the 'speaking' signalling. In order to explain this, there is no necessity for going over the whole length, seeing that the line is 'cut up' into sections of some two miles each, at both ends of which there are either ordinary stations, or—as at Abbot's Kipton—mere specially erected block-signalling boxes. The chief and guiding principle of the block-system is that, under no possible circumstance, or combination of circumstances, shall two trains proceeding in the same direction be on one section of the railway at the same time. In order to effect this, telegraphing is necessary; but it is, for many reasons, of the most simple kind. The instruments at either end are provided with one needle only. When it is upright and at rest, the line is 'blocked' to any succeeding train; but when the handle actuating the needle is held or 'pegged' over, the way is clear. The 'pegging' is literally effected by placing a peg of wood in a hole, so as to hold over the handle and needle in such a way as shall leave the signalman's hands at liberty to attend to the levers which control the signals outside.

Let us, by way of illustration, take the case of

the particular express train the fortunes of which we have been following. The signals of box A are at danger, or, technically speaking, 'against' the train, owing to box B not having made known that a goods-train has passed his position. Until the goods-train does so, the line is 'blocked,' and our express must be held in check. As soon as the section is made 'Line clear' by the signalman at box B, the man at box A lowers his danger warning, the express engine-driver ceases to whistle, and again 'urges on his wild career.' Every one of these stoppages is recorded on the 'report sheet' of the driver and head guard of the express, and also by the block signalman; so that when the time for explanation shall come, which it surely will, in the severe routine of the system—the last-named may shew why he stopped the passenger train.

How excellent, then, and almost perfect, under all ordinary circumstances, must be the system which permits of a constant stream of traffic being conducted without any stoppage at all! For weeks together the fast trains keep precisely to their appointed times throughout their journeys. Even goods-trains get through without delay—an instance in point being mentioned to the writer on the day after the Abbot's Ripton collision, by the guard of an express goods-train which runs nightly from Manchester to London. This man said that for weeks together he had run all the journey without being called upon to record a single stoppage on his report sheet.

We will suppose, however, that an accident does happen—that this apparently simple machinery does get out of gear and such instances unfortunately occur with but too great frequency. As soon as the accident is ascertained, messages are at once written out with the prefix S.P. (meaning 'Special,' Pressing)—which on most lines is used to denote extreme urgency—for assistance. The nearest stations on both sides are informed; a telegram is sent to the district inspector, to the superintendent of the line, and the nearest 'break-down' depot. In extraordinary cases, too, the general manager and secretary are similarly informed. Alas! however, even the prefix S.P. is not always omnipotent. Messages with this prefix are supposed by the rules of the railway telegraph service to take precedence over all besides, and other messages which are in course of transmission may be interrupted for them. Sometimes, however, the telegraph clerks or signalmen, as the case may be, turn stupid. 'Wolf,' they know, has often been cried when he did not actually exist. The prefix has, in short, lost much of its significance by being made use of in order to secure the despatch of ordinary but long-delayed messages. So, in spite of the warning letters, they will not give way. They jerk the needles about in a higgledy-piggledy sort of fashion, or they sullenly peg over the needles so as to prevent the transmission of any signal whatever. This is called 'fighting.' Something of the sort was mentioned as having occurred in connection with the Abbot's Ripton disaster. The 'fighting' is generally soon over; but sometimes all the persons concerned become angry, refuse to concede a point, and fight for hours. They all know how greatly they are erring, and that some one or other—probably all—will be 'reported' and fined, or, it may be, dismissed; yet they will not give way a hair's-breadth. It is, in fact, an exhibition of

telegraphic temper, just as plainly manifest to all those concerned as though they were all wrangling together in one room. They even, in some instances, make rude remarks or swear at each other in this manner. Not unfrequently, the clerk or signalman at some intermediate place, however, takes no part in the dispute, but merely looks on. In this way, if he is disputatious, yet cautious, he may prove an avenging Nemesis, and may be the means of procuring the punishment of all the actual disputants. In the case of an accident involving injury to passengers, this 'fighting' delay may entail the most serious consequences, and may even cause loss of life, by delaying the arrival of proper surgical or other assistance.

We thus see how vital a part is played in the ordinary daily train services of the country by the puny telegraph wires, and how terrible the results may be, as was instanced in the Abbot's Ripton disaster, in case of their failure. Snow-storms are probably the worst causes of telegraphic break-downs experienced in Great Britain; but very wet weather or violent thunder-storms often conduce to the same effect. The lightning sometimes fuses the delicate wires of the coils in the telegraph instruments into one dumb mass, or for a time demagnetises the needles (causing all the currents to operate in directions exactly opposite to those required to be indicated); the wet conducts the fickle electricity from one wire to another, so causing what is called 'contact,' which results in an indistinguishable jumbling up of the signals. Snow, however, acts mechanically, and by its sheer weight breaks down the wires. On the morning after the Abbot's Ripton collision, the writer saw miles of wires, as well as the posts in many places, borne down to the ground, the snow having frozen on the wires as thick as one's arm. This was indeed a ruinous downfall; and only those who saw the terrible debris of the up Flying Scotelman and the down Northern express piled up in chaotic heaps, can properly appreciate the full consequence of what havoc may be wrought in a few hours even by so innocent-looking a substance as snow.

THE PRIMROSE.

The following sonnet was written by John Clare, a 'Northamptonshire Poet' of the last century. His powers of description and generous sentiment exalted the reputation of Clare, and stamped him as a true poet.

Welcome, pale primrose! starting up between
Dead matted leaves of ash and oak that strew
The every lawn, the wood, and spinney through,
'Mid creeping moss and ivy's darker green;
How much thy presence beautifies the ground!
How sweet thy modest unaffected pride
Glows on the sunny bank and wood's warm side!
And where thy fairy flowers in groups are found,
The school-boy roams enchanted along,
Plucking the fairest with a rude delight:
While the mock shepherd stops his simple song,
To gaze a moment on the pleasing sight;
O'erjoyed to see the flowers that truly bring
The welcome news of sweet returning spring.

THE EMIGRANT CARAVAN.

TWENTY years ago there was a considerable movement of emigrants from Arkansas and some adjoining states towards California, which was then beginning to get into a flourishing condition. As the way was long across the prairies and Rocky Mountains, and dangerous from roving bands of Indians, the emigrants bound for the far west usually formed a large body for mutual assistance and protection. These trains or caravans of emigrants sometimes consisted of upwards of a hundred persons, men, women, and children, with wagons, horses, and cattle. The men were armed with rifles, not only for defence, but to kill game, as an aid to the general store of food.

We are going to tell the story of one of these large cavalcades, which we do from authentic sources.

In the month of July 1857, a body of emigrants proceeded from Arkansas, numbering a hundred and fifty persons. Every age was there, from the tender infant in the mother's arms to the old gray-haired man. In proceeding towards California they selected a route through Utah, which had been settled some years previously by the Mormons, from whom it was expected supplies of provisions could be purchased. The vast and solitary prairies had been safely traversed. The range of the Rocky Mountains had been thankfully left behind. The emigrants had now reached the plains of Utah, and bent their way to the Salt Lake City, the headquarters of the Mormons. They had heard strange things of this community, but did not doubt that, in passing, food for themselves and provender for their cattle could be obtained from them on payment of the proper value.

The approach of the emigrant train was known in Utah. Many travellers had passed them on the road, and become aware of their intended visit to the Salt Lake City. The intelligence of their visit roused sentiments of hostility among the Mormon leaders, who by no means wished to give any friendly aid to so large a body of Gentiles—as

they called all who differed from them in their fantastic religious dogmas and usages. To the amazement of the emigrants, admittance to the city was denied, all assistance was refused, and the almost half-starving wayfarers were sternly ordered to quit the precincts without delay, and proceed on their journey. In this unexpected emergency, they had no choice but to submit, and striking their encampment, they dolefully went on their way westward. They passed many flourishing settlements, but one and all received them in the same cold and churlish manner, acting under orders, that had been despatched from Salt Lake City. It was distinctly understood that no intercourse was to be held with the emigrants. No provisions of any kind were to be supplied; and all settlers in the Mormon colony well knew that these orders must be obeyed, or the vengeance of their superiors would be the inevitable consequence.

The unfortunate emigrants found themselves rejected on all sides. Innocent as they were of the remotest intention of evil, they were unable to understand the meaning of this strange behaviour on the part of those from whom they had looked for civility and good feeling. An Indian, more humane than people of their own race, sold them thirty bushels of corn; but this was but small help in their desperate extremity. Their stock of provisions was failing fast, and the condition of their horses and cattle was pitiable. The strength of the wretched animals was so greatly reduced by the absence of the necessary provender, that they could travel only slowly and feebly along the plains that lay between them and their destination.

Creeping slowly along in this distressed condition, the party at length arrived at a town called Corn Creek. Here the wayfarers halted. They did not form any expectation of being succoured in their extremity, because here resided the commander of all the forces of Southern Utah; but they imagined they might procure information as to the possibility of getting supplies of forage for their worn-out animals. The official applied to was ready with an answer. His instructions had been sent to him from headquarters. He told the

emigrants that at a spot called Mountain Meadows they would get what they required. To this place they at once repaired. There they found good and abundant pasturage for their cattle, and they hoped to rest for a time after their fatigues and disappointments.

These peaceful anticipations were not to be realised. The doors of the colonists had been shut against the strangers by orders from the Mormon chiefs. For a great distance around, it had become generally understood that the destruction of the entire emigrant company was speedily to be accomplished. As, even with all their power, the Mormons could not safely destroy a hundred and fifty persons, the device was fallen upon of throwing on the Indians the blame of a general massacre. The plot was as ingenious as it was secret and cruel. By some prospect of plunder, held out to them, the Indians were to set upon and kill the whole party, leaving not one to escape. In modern days we have nothing to match this iniquity. A parallel to it is found only in the records of history. For anything similarly atrocious, we have to go back to the massacre of Glencoe, promoted by that accomplished but very heartless person, Sir John Dalrymple, afterwards first Earl of Stair. Just as no friendly hand was held out to prevent the wholesale slaughter of the Macdonalds, so no one within the sphere of the Mormon jurisdiction uttered a warning whisper to put the Arkansan emigrants on their guard. At a meeting held at a place called Fort Harmony, for the special purpose of discussing the affair, a show of hands was called for, and a woman stated afterwards that she held up her hand with the rest. Then, remembering the nature of the business, and what the gesture was designed to express, she instantly withdrew her hand; but this was all. So absolute was the obedience enforced by the despots who ruled the colony, that no one was courageous enough to declare his abhorrence of the foul crime that was contemplated.

Meanwhile, the emigrants rested in peaceful ignorance of all that was going on around them. Lulled into a fancied security, they had no thought of the dark treachery that was secretly scheming their destruction. But one day, as with a thunder-clap, these pleasing visions were rudely dispelled. On the 7th September, the quiet encampment was plunged into confusion and dismay by the sound of musketry. A volley was unexpectedly discharged among them, and the horror-stricken emigrants rushed wildly out to see many of their number dead or dying on the ground, and to find themselves surrounded by a horde of Indians. Anglo-Americans are not slack in taking steps to defend themselves against a surprise. In a moment, comprehending the full peril of their situation, they, like brave men, quickly resolved on defence. Wheeling their wagons into a corral, or circle, they rapidly threw up the earth as high as the shafts, to form an embankment. Behind this shelter they barricaded themselves, and there

they remained, while their assailants kept up a desultory fire until nightfall. Seven of the emigrants were killed in this attack, and many others were wounded. Every one who shewed himself for a moment was shot at, their ferocious Indian assailants keeping up a noise of whooping, yelling, and other discordant sounds.

With all its horrors, the attack was so far a failure. The Mormon leaders had been frustrated in their hideous design. The Arkansans stood well on their defence, and there was little chance of subduing them by this species of attack. Obviously, the emigrants had skilfully fortified themselves in their encampment, and were prepared to the uttermost to resist any further assault. It was clear they had resolved to sell their lives as dearly as they could.

The Mormons felt that they were foiled in the attempt to destroy the emigrants through the agency of the Indians. Some other plan must be resorted to. The authorities at Corn Creek despatched an Indian runner to Cedar City to convey the intelligence that the emigrants were stoutly defending themselves at Mountain Meadows, and could not be dislodged. Cedar City, which was a Mormon outpost with a military organisation, immediately took measures accordingly. A troop was directed to march to Mountain Meadows, to bring matters to a conclusion. Seeing that the Indians had failed, the Mormon forces must now at all hazards interpose. At the same time, it was felt, that instead of an open attack, treachery might advantageously be attempted. The first idea was to cut off supplies, and starve the emigrants into surrender. But as this would be a work of time, there was a resolution to employ stratagem. Let us see how the thing was effected.

Closely beleaguered in their camp, cut off from both food and water, the wretched emigrants felt their hearts failing them, and saw but one horrible termination to their long-continued sufferings. Their joy may therefore be imagined when they suddenly beheld a small party of soldiers approaching their camp, bearing aloft a flag of truce, an emblem held sacred by all civilised nations. Nothing doubting, they gladly hailed the pleasing spectacle; and trusted that at last deliverance from all their troubles was at hand. The occurrence has been fully described by several who were eye-witnesses of the parley and its results. A man stepped out of the line of soldiers, and, holding up the flag so that all might see it and understand its import, he advanced towards the corral where the emigrants were intrenched. He was accompanied by two or three others, chief among them being John D. Lee, sub-Indian agent, who had been specially selected by the Mormon government to carry out this treacherous act to its swift and bloody conclusion.

Two or three of the emigrants came out from the corral and went to meet the bearers of the flag of truce. Lee then declared he had come as a friend; and he proceeded to inform them that

the Indians were greatly irritated, and were determined to destroy the whole party; that he and the company of soldiers had come there in the hope of assisting them; but that, on conversing with the Indians, he had found them very obdurate, and nothing would pacify them but the surrender on the part of the emigrants of the whole of their provisions, arms, and cattle. 'If you will deliver up these,' he assured his dismayed listeners, 'the Indians will cease to molest you; and under any circumstances we will protect you from their violence.' The alternative presented to them was not an encouraging one, but the poor emigrants had little choice. Still they hesitated; and a long and anxious consultation followed. Lee entered the corral, and remained for a considerable time, some say for hours, urging his treacherous proposal.

A great dread filled the hearts of the Arkansans. If they yielded to the imperative demand, and evil consequences ensued, there remained to them no power of resistance; their fate they knew would be sealed. Many among them feared deception; others expressed their willingness to trust the solemn assurances made to them by Lee. Finally his specious arguments prevailed, and the emigrants consented to the terms which alone—so they were repeatedly told—would insure their safety. Lee then arranged the plan of capitulation. The wounded men and the younger children were placed in the wagons, and driven past the troops, the women and elder children accompanying them on foot. The work of destroying them had been already assigned to the Indian allies, who were waiting in ambush for the signal that should direct them to commence their share of the massacre. The men of the emigrant party were then reduced to single file, and by the side of each defenceless victim marched a Mormon soldier carrying a loaded musket. In this manner they proceeded for half a mile, till the chosen spot was reached. Here a halt was called, a signal given, and next moment every soldier had fired on the man beside him, and nearly all the brave Arkansas settlers lay dead or desperately wounded. A few, less injured than the rest, sought safety in flight, but they were pursued and overtaken, and immediately slaughtered. Not one man was left to tell the tale.

Meanwhile, the Indians had darted from their ambush and fallen on the unfortunate women and children. All the women were massacred, and nearly all the children. The lives of seventeen innocent little creatures were spared, because they were so young that no after-revelation of the atrocious deed could be feared from them. In this manner perished the entire body of emigrants.

The designs of the Mormons being thoroughly consummated, what remained to be done? Merely to dispose in some rough fashion of the bodies, and to share the spoils of the deserted encampment. The little children, who had been spared, were mostly given over to the Indians; probably to lend a colour to the report, at once spread abroad by the Mormons, that the massacre had been the work of the red men. Some of the cattle were driven to Salt Lake, where they were sold.

At the time of the commission of this horrid deed, Utah was completely isolated from the world; and as the work of extermination was made so thorough that none survived to tell the tale, except a few children too young to recollect

it, a dark mystery shrouded the whole occurrence; and nothing was known of it for a considerable time, except among the few scattered communities living in the neighbourhood. They scarcely dared to whisper it among themselves; the Mormon leaders kept their guilty secret; and soon a collection of bleaching bones was all that met the eye to tell the passing traveller of the treacherous deed that had been perpetrated in that lonely region. At first, it was supposed that the Indians had massacred the company, and the story was told to the world as a caution to those designing to cross the plains; but so terrible a secret could not be for ever kept from the knowledge of mankind, and in the course of time a report was gradually spread that it was not the result of Indian barbarity alone, but that the Mormons had had a large share in the butchery. About eighteen months later, by which time the reports had acquired some consistency, a district judge of Utah attempted to make some investigation into the occurrence, and summoned a grand jury to inquire into the various murders and assassinations that had for some time been notoriously prevalent in the colony, among them this massacre at Mountain Meadows. Testimony was produced which implicated a number of prominent men in the Mormon community; but it was impossible to get the grand jurors to act with honesty; they refused to find indictments, and were finally discharged.

Many years passed, and no special notice was taken of the massacre at Mountain Meadows; various difficulties between the Federal and Territorial authorities in Utah throwing fresh obstacles in the way of an investigation. But the carefully hidden secret had gradually transpired; public attention had been drawn towards this atrocious deed, which had so long remained unpunished; and when, in the year 1874, an Act was passed, by which grand and petit juries can be summoned, one of the earliest cases set down for hearing was the Mountain Meadows Massacre. After various delays, in consequence of the difficulty of procuring witnesses, the trial was fixed for July 12, 1875, in the District Court at Beaver, in Southern Utah. Fresh obstacles intervening, occasioned a further delay; but the trial eventually began on the 23d, and extended through the first week of August. It was called 'the Lee Trial,' the indictment being laid against John D. Lee, who was known to have been the leading instigator of the massacre, though it was equally well known that he but acted in obedience to orders from the Mormon chiefs. District-attorney Carey opened the case for the prosecution; Judge Boreman presided; a great array of legal talent assembled for the prosecution and the defence; numerous witnesses were summoned to testify to what they knew, and to facts that many of them had actually seen.

The defence was of the most lame and inconclusive description. Statements were advanced for which no particle of proof was forthcoming. All present felt that it was a total failure. The prosecution detailed the circumstances connected with the massacre in the minutest manner; many witnesses swore to their previous knowledge of the cruel deed about to be perpetrated; while others described the horrid tragedy, which they had not only seen, but in which some of them had lent a

helping hand. Only one impression remained on the minds of all impartial and unbiassed listeners, that Lee had acted as principal throughout the whole affair. The case was then left to the jury, who consulted for three days, and then announced themselves unable to agree upon a verdict—nine being for acquittal, and three for conviction. The jury was thereupon discharged, and the prisoner was held over for a second trial—if such should ever take place.

Much interest was awakened by the Lee trial in the United States. The public prints were full of the details of the massacre and the trial; and with the exception of two or three journals published in the interest of the Mormons, which attempted faintly to palliate the crime and justify the jury by making light of the evidence, every paper which expressed an opinion on the subject joined in the chorus of abhorrence of the treacherous affair. Looking, however, to the generally corrupt and feeble administration of justice in the United States, it does not appear probable that the instigators and perpetrators of the massacre will be visited with the punishment which is justly their due.

In the narrative as usually given, little is said as regards the motives which led to such a wholesale slaughter. The cruelty seems senseless and gratuitous. We can only gather that a jealousy of being intruded upon by large bodies of strangers not of their own religious profession, induced the Mormon chiefs, with Brigham Young at their head, to adopt this infamous method of securing their permanent seclusion. In aims of this kind, and with many acts of tyranny, they secured their object until the opening of the railway to Salt Lake City, when a more tolerant state of things, and some modification of the absurd Mormon usages, were successfully introduced.

FALLEN FORTUNES.

CHAPTER XVII.—TO BE, OR NOT TO BE?

WHEN John Dalton reached the head of Sanbeck Valley, there were two courses open to him: either to keep straight on along the east road, which was soon merged into a bridle-path along the moor that led to Bleabarrow Mere; or to return to Riverside by the way he came. It had been his intention to join the party on board the steam yacht; but he now carried about with him that which caused his heart to beat so wildly at the very thought of his wife and children, that he could not trust himself to meet them. It is always open to the wretched—those at least who are not in prison—to end their woes by rope or razor; but it is not so easy to use those remedies. But once one is possessed of a few drops of poison, the case becomes very simple: a dose of medicine is not difficult to swallow. We have the key of the next world in our pocket, and one turn of the hand admits us.

One step from the deathbed,
And one from the bier,
And one from the charnel,
And one— Oh, where?

says the poet. But, for John Dalton, even those few steps were now shortened—if he only so willed

it. Though the matter only respected his own fate, he was filled with a tremendous sense of power. He had but to lift his hand, and the secret that has defied mankind to pierce it since the world began, lay within his grasp. For the moment, he felt no inclination to use his advantage; but he felt immensely flattered in the possession of it. Thoughts of the Great To-come had, of course, occasionally occurred to him, but only in that conventional and abstract form in which they present themselves to ninety-nine hundredths of his fellow-creatures; familiarity with them had certainly bred no contempt for it in his mind; and now he could think of little else. He had climbed the crags, and was looking around him in all directions save one—his face was studiously averted from the long blue lake, on which the yacht, though distant, was distinctly visible. The very world seemed to be at his feet, and to afford him the opportunity of a comprehensive Farewell. How exquisitely beautiful looked the tranquil valley from which he had just ascended; how peaceful were the hours men passed in it, and how contented, to all seeming, were they with their lot! Old Joe Landell, of the Nook yonder, was dying, it seems, and doubtless sorry to die; while he (Dalton) was hale and strong enough, yet weary of his life. How cruel and unjust seemed the ways of—Fate.

It was impossible, however, to smooth matters over with himself now; he must needs face the truth in theory, as, without doubt, if he put his design into effect, he would have to face it in fact. If God was cruel and unjust in this world, might He not also be so in the next? The 'to be, or not to be' of Hamlet is self-applied by every man in Dalton's case, whether he has heard of Hamlet or not. There are many considerations, but the gist of the matter lies in a nutshell. As to what men say of suicide generally, that did not disturb him; he was too near the thing itself to be moved by the cant of those who have only regarded it from a distance, and with no reference to themselves. It is 'cowardly,' they say; whereas it indeed requires the extremest kind of courage—the courage of despair. They might just as well call a man a 'coward' for going to the dentist's and getting a raging tooth drawn, instead of letting it rage on. The topic is one of those upon which men have agreed together to talk rubbish. Even Shakespeare has told us that the Almighty has fixed His canon against self-slaughter, though whence the poet derived the information he has left untold. At the same time, that it is forbidden by implication, is true enough; and indeed it is very literally 'a-flying in the face of Providence,' since a more violent protest against the lot that has been assigned to us, or a greater reflection upon Him Who imposed it upon us, can hardly be imagined.

This last consideration, however, was not that which troubled Dalton most. Strange as it may appear to superficial observers of human nature, morality in such cases commonly makes a better fight of it—intercedes more eloquently for the precious life—than religion itself. Dalton thought comparatively little of the question which theologians have affirmed to be the most pressing of all, 'Will this be displeasing to the

Supreme Being or not?' but was greatly disturbed by an analogous though not necessarily a synonymous consideration, 'Is this right?' and this again resolved itself presently into a very concrete form, 'Will it be committing fraud against the *Palm Branch Insurance Society*?' It was above all things necessary—in order to spare the feelings of his wife and children—that his death should be attributed to natural causes; and yet in that case they could reap an advantage to which they had obviously no right. At one time, as we have seen, this consideration had been sufficient to cause him to put aside the notion of self-destruction; and if it had not been for Mr Campden's conversation with him respecting the *Palm Branch*, it is probable he would never have reverted to it. Even the chairman of the Board of Directors had not been able to persuade him that he had a right to derive advantage from a policy one of the conditions of which he had deliberately violated; but if, to meet their own purposes, the Society should waive their objections, he would surely—so he endeavoured to persuade himself—be in a different moral position. And that they would do so, he had very good reason to believe. The chairman had announced his intention of pressing that course of conduct upon his colleagues even in case of a stranger; and he was not likely to be less strenuous where the interests of a friend—if the dead can be said to have interests—were involved. Moreover that he would be committing no fraud—in the way of deception at least—so far as Mr Campden was concerned, and through him the Company, he felt assured. It was a trifling circumstance, yet one which, in the event of his sudden death, would at once have an immense significance in the eyes of his host, that he had never mentioned to him, while talking of that very topic, that he himself was insured in the *Palm Branch*. It was perhaps by accident that, when the subject was first started, he had been reticent upon this point; but while the discussion was proceeding, he had reflected on the matter, and maintained his secret by design. Now, supposing that he should die very suddenly—much more under circumstances that would suggest suspicion—it must needs at once strike Mr Campden as very remarkable that his friend had been silent upon such a point; from what Dalton knew of the other's character, he was confident that he would feel it his duty to communicate his conjecture to the Insurance Society; and that having thus satisfied his scruples, he would do his best, both on public and private grounds, to procure the payment of the policy to Mrs Dalton and her children. By these arguments Dalton had silenced, if he had not convinced the voice of conscience, as respected the *Palm Branch*, and had so surmounted his chief difficulty. For to have put an end to himself, with the knowledge that in so doing he was committing a fraud, would have really been an impossibility with him; the like reflection has probably kept scores of wretched men in this world, and will continue to do so; but the thought that their fraud may not be successful, and their policies be lost, has restrained hundreds.

In spite of the reprehensible circumstances in which we now find him placed, John Dalton would have been a better man, even though he hurries his exit, than the majority of those who wait decorously on the stage for the fall of the

curtain. It was the suddenness of his calamity which had overthrown his judgment, and prevented perhaps his fertile mind from suggesting some less tremendous expedient for escaping from his sea of troubles than that of flight. Nor was self, it must be allowed, the promoter of his rash design. If his mind were not now occupied by his beloved Edith and her children, it was because he did not dare to dwell upon that subject; his heart, which was not dismayed at the thought of that dread leap in the dark, melted like wax at the thought of *them*! He was not leaving them, as many a self-slayer does, to whom the epithet 'coward' is applicable enough, alone and unprotected, deserted by the man within whose power it was to win their bread. His loss would be a gain to them every way; they would ride more buoyantly on the wave of Life, for his removal; and many a friendly sail would assist their little bark, from which they could have accepted no such aid had he himself—very literally 'a pilot to the shores of—Nothing'—been on board of her.

All these reflections occurred to him confusedly, hurrying across his mind one after the other, like flying clouds over a hillside, but all tending to one point. It is but seldom that such a dread resolve as Dalton had in fact as good as come to, is determined upon by gradual steps. Mr Campden, I think, somewhat overrode his hobby;—otherwise, a trustworthy nag enough in striking out the six months' proviso as respected suicide, from the regulations of his *Palm Branch*. In the mood in which John Dalton now found himself, he would have insured in half a dozen such unprotected offices, and killed himself next day; but he could not—in fact, though the opportunity was open to him, he *did* not do so—have insured his life with the intention of putting an end to it after the expiration of half a year. It is not so easy as some philosophers would persuade us to look certain death in the face for months, and yet retain our equanimity, even when our friends are assisting us to do so; but to play the hypocrite to those dearest and nearest to us, to persuade them that all is well with us, while our inward eye is fixed upon the gaping grave, is a rôle beyond that of most actors. From what he had already experienced, Dalton, at all events, was well convinced that such a sustained effort was beyond his powers. If the thing was to be done, it was not only best but necessary to do it quickly. Upon one thing Dalton had long made up his mind—namely, that the catastrophe should not take place beneath the roof which he still called his home. The improbability of his decease being attributed to his own hand would, he justly concluded, be increased by its occurrence at a time when he was a guest upon a visit of pleasure; and though this was hard upon the Campdens, his necessities were such that he must needs be hard on some one. Their home would be made hateful to Edith and the girls, were it made the scene of such a tragedy; whereas the folks at Riverside would soon get over it. He pictured to himself, with something like a smile, how his hostess would inveigh against him for his want of consideration for her feelings, if she could have looked into his mind at this moment. Would it have a good or a bad effect, he wondered, upon her position 'in the county?' It would certainly give the house a temporary interest, and if his ghost should be

reported afterwards to 'walk' there, even quite a flavour of antiquity. He did not believe in ghosts walking, yet the fancy was sufficient to set his mind speculating on the possibility of his discontented spirit being aware of what was going on in the world after its departure. Would it be cognisant of the future of those dear to him, and note their troubles, without the capability of giving them aid? their dangers, without power to warn them? If he feared for himself at all, it was upon this account. It was surprising, even to himself, how little he was affected by those material terrors, in the reality of which he had been brought up to believe; how much his mind still dwelt upon this world, though he stood upon the brink of the other.

Though his thoughts wandered so wildly and so far, they always returned, as doves to a dove-cot, to one small and insignificant topic—namely, as to when and where this thing should be enacted. The means, which had hitherto been his great difficulty, were now obtained; and he had but to fix time and place. What scene, what hour, was the best fitted—or rather, the least unfit—for the final catastrophe? Should it be next morning in the library?—to which he was still wont to retire after breakfast, upon pretext of business, though all such occupation for him was gone. In that case, Holt would probably be the first to find him, dead. Then he would tell Campden, and Campden would tell Julia, and Julia would have to break it to Edith. That would be the best plan, if he could only be sure that Holt *would* find him. But suppose Edith should look in upon him, under pretence, as often happened, of choosing some book to read with Tony, but in reality, as he well knew, to give him a silent caress, or whisper a word of comfort in his ear—why, that would kill her. And again, if it should happen in the smoking-room, when the others had gone to bed, and he was all alone, save for that Creator into Whose visible presence, perchance, he was about to precipitate himself, would not Edith be the person who would come and look for him, alarmed by his absence, and apprehensive, perhaps, of the very horror that had actually taken place; apprehensive, but not, alas! prepared for it; so that the sudden shock would leave his children not only fatherless, but orphaned!

In the unhappy frame of mind he was now in, the man could, and did, picture to himself the event under a score of circumstances, to every one of which there was an objection, upon the same ground: in none was it certain that the catastrophe could be broken to his wife without danger of the most fatal consequences. If she had been in her usual health, he could have trusted to her paramount sense of duty to preserve her under the worst disasters; her first thought, when nature permitted her to think, would have been for the children that were still left to her, and for their sake she would have borne up—and lived on. But as it was, enfeebled by her condition, and already depressed by misfortune, it was only too probable that she might not have the power to rally from such a sudden blow, at all.

It was curious that not till after he had proposed and rejected many schemes, did the thought strike him, 'Why should I not do it *now*?' Except for that dark spot, with a thin ribbon of dark cloud above it, on the distant mere, there was no sign

of movement or of life about him. It was unlikely that he should ever find himself more alone than at that very moment. Save for the dull roar of the rapid river, hundreds of feet beneath him, and for the distant tinkle of a sheep-bell from the valley he had just left, not a sound broke the surrounding silence. If it is ever easy for a man in health and vigour to lie down and die, it was easy for him to do so now. If ever circumstances can be said to be in favour of such a deed, they were so now. If an opportunity was ever afforded for a man to kill himself—yet to seem to others to have died in the course of nature—it was offered to him now. He looked into the future—not the future of the next world, even yet—and all things seemed to suit with his fell intent. He had just been to his doctor to consult him about a supposed heart-disease, and the doctor had as good as confirmed his own expressed suspicions that such a mischief was at work. 'I should not myself be surprised,' he had said, 'if I was to hear that you had suddenly dropped down dead.' It was true that this had been wrung from him, after much pressing—by what lawyers term 'leading questions'—but Carzon had not probably been aware of it; and even if he had been, when the thing had happened, he was certainly not likely to eat his words. He had but to repeat them, and there would be surely no occasion for any *post-mortem* investigation. The path by which Dalton had reached the summit of the crags was very steep, though it had, in fact, put him but a very little out of breath; and its ascent might easily be credited with having cost a man affected with a heart-disease—and who had been found dead on the top of it—his life. If the doctor had any doubts—if the merest scintilla of suspicion could be called such—he would certainly give them, for all reasons, in favour of 'Death from natural causes.' Dalton had parted from him, if not in high spirits, still with perfect cheerfulness; and if he had shewn despondency at any period of the interview, it had arisen, apparently, from his suspicions regarding his own health. Upon the whole, it seemed that Dalton's expedition of that morning had procured for him a most important witness.

There was indeed the absence of the laudanum from the bottle to be accounted for; but that could be effected in two ways. Dalton could either take a draught of it, and then break the bottle with the rest of its contents in his pocket, when the breakage would be accounted for by his fall; or, having drunk what was necessary to effect his purpose, he could fill up the bottle with water from a little spring that was close at hand. The doctor himself had stated that he had sold him laudanum enough 'to kill half the parish,' so that a very moderate quantity would suffice for his purpose. As for the Afterwards—he would presently be missed at home, and since he had moored the boat on the right bank of the river, it would be guessed that he had crossed over into Sanbeck, probably with the intention of calling at the doctor's; the very man would, therefore, be at once communicated with on whom he mainly relied for the final safe-conduct of the affair; while in the meanwhile, time would allow of misgivings and apprehensions, which, however painful in themselves, do somewhat break, to those who entertain them, the shock of calamity. The house, though

at some distance, was full in his sight, in which all the degrees of suspense and wretchedness—uneasiness, dismal foreboding, and despair—were about to be inflicted by his own hand on those he died to benefit, yet he gazed on it with apathetic eyes. Death was so near to him, that feeling was already dulled by its icy presence. It was more mechanically than, as before, of resolute design, that he now kept his back turned to the moorland lake—where the black speck was growing larger every moment, which was the steam-yacht *Mary*, bringing his unsuspecting dear ones home—and took the laudanum from his pocket.

He had a flask fitted with a drinking-cup, and into this he poured sufficient, as he judged, of the deadly drug to effect his purpose: placing this upon the turf, he substituted water from the spring for the liquid taken from the bottle, and replaced the latter in his pocket. Then all was indeed ready. It was astonishing, even to himself, how steady was his hand as he raised the fatal draught to his lips. If the claim of Socrates to philosophy, reflected he grimly, rested only upon his calmness in taking the hemlock, John Dalton was as good a philosopher as he. He had 'done' his thinking in this world, for good and all, and was wholly occupied with the matter in hand; he only indulged himself in one surmise—which was likewise Socratic—How long would the poison take to work? Would he fall at once into a deep sleep? Would he feel pain? Then he drank it off very quickly, and to the last drop—after which he carefully washed out the drinking-cup, and returned it to its proper place. As he did so, it suddenly occurred to him that his mouth—he had said to himself his 'breath,' and then mentally corrected his mistake, with a smile that was very like a shudder—that his mouth would smell of the poison. He remembered that in many cases of suicide the fact was at once discovered by this simple means, and yet he had almost forgotten to take so ordinary a precaution. He now wetted his lips with a little wine from his flask, and took out his cigar-case. 'The wine and the tobacco together,' thought he coolly, 'will surely overcome the scent of the laudanum. But in selecting his cigar, his hand trembled excessively, for the case from which he took it had been his wife's gift, and was embroidered by her own fingers. Almost everything that John Dalton had, of a handy or luxurious sort, had been given him upon one or other of his birthdays by his wife or children, and he was wont to use them as a matter of course. But now, as he was leaving his Edith for ever without look or word of farewell, the touch of the silken flowers that she had woven for him, sent a pang to his heart so keen and vivid, that he almost doubted whether it might not be already due to the poison he had swallowed. When he put the case away, however, the pain went with it, and he sat down on the turf, and began smoking his cigar. If he had stood up a few minutes longer, he would probably have been seen by those on board the yacht, which had by this time left the mere, and was speeding home between the river-banks. As it was, they came on—the young people still at their jests and games—opposite to, and immediately under the very crag where Dalton sat. He heard them, or heard something that seemed to mingle with the murmur of the river, and yet was not of it; and dimly curious—for his mind was clouded,

and his senses only half obeyed his will—would have risen to see what it was; his limbs, however, were numb and nerveless, and in the attempt to get upon his feet, he fell, and rose no more.

IRISH BULLS.

VARIOUS theories have been propounded why Irishmen have a tendency to make ludicrous blunders in speaking. The Edgeworths, father and daughter, actually went the length of compiling an *Essay on Irish Bulls*. In the true spirit of patriots, they have done their best to defend their countrymen from the charges of absurdity which have been always brought against them; though a candid reader will be inclined to admit that a groundless anxiety has been displayed by the talented essayists to exonerate their fellow-countrymen from the reproach of dullness or stupidity.

As the Edgeworths themselves admit, the so-called blunders of the Irish seem to arise not so much from any want of natural talent, as from the rapidity with which their ideas crowd upon one another, occasioning frequent ellipses and incongruities. As his parts are more brilliant than solid, poetical and flighty, rather than accurate and precise, the Irishman deals largely in metaphorical and figurative language, but pays little attention to the arrangement and classification of his thoughts, frequently passing over many links in a chain of ideas, and leaving it to his auditor to supply them. Whether Miss Edgeworth's suggestion, that as English is a foreign language to the natives of Ireland, 'it is scarcely within the limits of probability that the Irish should avoid blunders both in speaking and writing,' tends at all to explain the phenomenon, we shall leave the reader to decide. Comparatively speaking, John Bull is a prosaic creature; and while being apparently amused with the eccentricities of his Hibernian neighbour, is it not just possible that his amusement may be tinged with a *souffron* of jealousy? Be that as it may, Paddy may quote, if he choose, the celebrated apology which Sir Richard Steele makes for his countrymen—that bulls were all the effect of climate; for 'if an *Englishman* were born in Ireland, he would make just as many.' The thanks which the devout lady rendered to 'Providence and another woman' for her escape from drowning; the advertisement of a washing-machine, entitled 'Every man his own *washerwoman*;' and the ingenious suggestion that the best way to boil potatoes was 'in cold water,' are all instances of the ellipses so frequent in Irish speech.

Exaggerations and emphatic repetitions form a great source of Irish bulls. Thus, the enthusiastic Hibernian who praised a portrait as 'more like than the original;' and the admiring daughter of Erin who delivered her opinion as to the resemblance of two children in the following remarkable words: 'How like the two little dears are, especially Patrick,' sinned only in letting their zeal outrun their discretion. We may fairly presume that it was more that fondness for home which is so strongly developed in Irishmen, than

any wild purpose of deception, which prompted Paddy Blake, while maintaining the superiority of the echo in his father's garden over that of any other place, to observe, with a *naïveté* which has won him immortality: 'If you say to it [the echo] "How do you do, Paddy Blake?" it will answer: "Pretty well, thank you."'

Can any such allowance be made for the well-known inquisitive genius who, when looking over a stranger's shoulder in a coffee-house, as he was writing a letter, observed him conclude in this fashion: 'I would write more, but that a tall Irishman is looking over my shoulder, and reading every word,' and exclaimed indignantly: 'You lie, you rascal!' But even this celebrated bull is totally eclipsed by the reply of the pseudo-mute, who, when asked, in an unguarded moment, how long he had been dumb, promptly replied, 'Five years, yer honour.' It is the exaggerative language to which an Irishman is addicted which makes him declare himself '*clean kilt*' when he is fatigued; while his fondness for metaphor has before now induced him to swear an alibi thus: 'My Lord, I could not, *like a bird*, be in two places at once.' The same cause produced the blunder in the Irish orator's exordium: 'I am sorry to *hear* my honourable friend *stand mute*;' and it was an undisciplined poetic fancy which prompted an Irish Presbyterian clergyman, a few months ago, to speak of the place of torment as an '*unfathomable abyss, down which the lost fall eternally*, till they are transfixed against the bottom.'

The following epitaph, if it be genuine, contains an excellent bull:

*Here lies the body of John Pound,
Who was lost in the sea, and never was found.*

But as 'high winds blow on high hills,' and people in lofty situations are more exposed to the attacks of critics than those in humble life, most readers will feel inclined to deal less leniently with the following bull, which Miss Edgeworth assigns to a Lord-licutenant: 'Whereas, the greatest economy is necessary in the consumption of all *species of grain, and especially of potatoes*.'

The ingenious method proposed by Paddy of obviating the difficulty of wedding a deaf-and-dumb pair, has furnished to some English wit material for a humorous epigram:

Says Johnnie to Paddy: 'I can't, for my life,
Conceive how a dumb pair are made man and wife,
Since they can't with the form and the parson
accord.'

Says Paddy: 'You fool, they *take each other's word*.'

Personal identity forms very frequently another stumbling-block, and is the cause of many a bull. An Irishman meeting an acquaintance on the street, will exclaim: 'Is that yourself?' as though he feared lest some other spirit should have entered his friend's body since their last meeting. A Scotchman will occasionally do the same, his greeting being: 'Is this you?' Under this head Horace Walpole classes what he styles the best Irish bull he ever heard: 'I hate that woman,' said a gentleman of his nurse, 'for she *changed me at nurse*.' Akin to that is the following salutation: 'I thought it was you, but now I see it is *your brother*.'

In the exquisite ballad *Edwin and Angelina*, Dr

Craig (*English Literature* on Goldsmith) detects a bull, and evidently plumes himself on his acuteness. We leave it to the reader's taste to determine whether he would wish the passage altered:

The dew, the blossoms of the tree,
With charms *inconstant* shine,
These charms were his, but woe is me,
Their *constancy* was mine.

If Irish poetry is to be thus criticised, may we not with equal justice find fault with Milton's sublime hyperbole:

In the *lowest deep, a lower deep*,
Still threatening to engulf me, opens wide?

Or how can we consent to pass over as a 'mere blemish' the following lines, which contain blunders utterly unparalleled in Irish poetry:

Adam the *goodliest of men since born*
His son; the *fairest of her daughters*—Eve?

Under the influence of the tender passion, the Irish will say some startling things. The restraints of reason and common-sense are powerless to check the wild flights and daring metaphors which love suggests. The swain who assured his mistress that he could not *sleep* of nights for *dreaming* of her, must have been very 'spoony;' and not less so was he who, when informed by his betrothed of the kindness shewn her by her intended mother-in-law, exclaimed: 'Well, wait till we're married, and see if I don't *beat my mother*.' It was in a gush of well-meaning hospitality that Sir Richard Steele—to whose account so many bulls are set down—exclaimed in rather an equivocal manner: 'If ever you come within a mile of my house, sir, I *hope* you'll *stop there*.' It was not love, we suspect, which prompted the fair young daughter of Erin, after a request for money made in a letter to her sister, to add as a P.S.: 'I was so much ashamed of what I have written, that I sent after the messenger, *but he could not be overtaken*.' Akin to this is the Irish gentleman's postscript: 'If this letter miscarries, write, and let me know.'

But it is not only in verbal bulls that the Irish excel; practical absurdities are also laid to their charge. It is a well-known historical fact that the rebels in 1798, desirous of ruining a banker whom they hated, broke open his house, and *burnt his notes*, fully satisfied that they were effecting his ruin. Had the banker been *another* person—to make a bull of our own—the burning of his notes would have been a serious matter.

We suspect that the absurdity fathered on the Irish in the following witty epigram is an Englishman's fabrication:

A cannon-ball, one bloody day,
Took a poor fellow's leg away;
And as on comrade's back he rode off,
A second fairly took his head off.
The fellow, in this odd emergence,
Carried him pickback to the surgeons.
'Holloa!' cries the doctor, 'are you drunk,
To bring me here a headless trunk?'
'A lying dog!' says Pat; 'he said
His leg was off, and *not his head*.'

In the *Vicar of Wakefield*, poor Goldsmith makes one of his characters perpetrate a bull of which he had been guilty himself. When his means ran low, he betook himself to the university of Leyden,

relying on teaching English as a means of earning a living. It was not till his arrival in Holland that he learned that, before beginning his course of instruction, it was necessary for him to learn Dutch.

But do bulls belong exclusively to the Irish? They have been unmercifully assigned to the people of that nationality; and as a consequence, errors of syntax and monstrous hyperboles, which would furnish abundant material for laughter if uttered by an Irishman, are passed over as merely grammatical mistakes, when the people of any other country are the culprits. 'The Dublin tramp who purloined chocolate to make 'tay' of it, was not half so ridiculous as the Englishman who, in all seriousness, asserted that a piece of cloth would 'last for ever, and make a petticoat afterwards;' and the Irish lady's hyperbole, 'rise in the morning and find your throat cut,' is fully matched by Macbeth's celebrated words:

But yet I'll make assurance doubly sure,
And take a bond of fate.

In a description of the funeral of Lord Macaulay in Westminster Abbey, the *Morning Post*, in language which called forth Dean Stanley's keenest sarcasm, unintentionally buried the organ: 'When placed on the ropes above the grave, and while being gradually lowered into the earth, the organ again pealed forth.'

The French are not altogether exempt from amusing bulls. In a translation recently issued, we observed the expression *Mangeurs de bœuf*, as an equivalent for our 'Beef-eaters.' Now, though this is certainly a literal translation of the expression as corrupted by John Bull, it is scarcely the synonym for what it ought to be—namely, 'Bouffettiers.' Blunders such as these would never have been pardoned in Irishmen, but are with questionable complacency pardoned on the part of all other writers and speakers. Very literal, but very funny, is the perplexed Gaul's translation of Cibber's comedy, *Love's Last Shift*—*La dernière Chemise de l'Amour*!

AN OLD LOVE-STORY.

IN THREE PARTS. PART III.

In a few weeks I was on the sea, with a detachment to join the army in the Spanish Peninsula, where we had to fight the French, which I supposed at the time to be but natural, although none of us knew or cared about the quarrel. Never a man did I hear express the least opinion on the matter. When we joined the army it was already in full retreat, with the French pressing close, in vastly superior numbers. I asked an Irishman in the ranks how it was that we were marching away from the enemy, and he grinned and winked. He had a face tanned like leather, and when he grinned and thrust his tongue in his cheek, I saw a great rough scar on his temples, that made me shudder. He knew nothing except that there had been a great deal of fighting, and a deal more marching, and not much plunder; and that the General hanged for mere trifles. He bade me cheer up, for that there would be a battle soon. But it was not so. We halted at last at a long range of hills not far from the sea, and there we were all set to work throwing up rough fortifications for batteries; and before long I saw the

wisdom of our general, for when the French came up, they were kept back at every point, so well had our great general placed his artillery, and so great was the natural strength of the position.

All the winter we lay there, behind the lines; and after a time the French fell back, and the fighting was over until fresh supplies and men came out to us from England.

I often wondered whether Willy was with us, but as I did not know his regiment, it was next to an impossibility to find out. I sincerely hoped he was not, for any one could see what was coming; and I hoped, for his own sake, for the old squire, for Uncle Stephen's, for Joy's sake, that he was not there, lest he should be killed, and make so many mourners at home.

I was with my regiment in several of the great battles that were fought against the French in the years 1811 and 1812, and all I know about them is that they were scenes always of ghastly slaughter, smoke, and noise, and that I lost my brave Irish comrade in the thick of the fight at Albuera. Sometimes, I must say, our men were driven back; but in the end we were always victorious, although the French were so numerous that it seemed as if the fighting would go on for ever. I was wounded at Badajoz, the most terrible fight of all, for there we had to carry a fortified town by assault. It was hot work. Twice we were driven back, but the third time we scrambled through the breaches of the broken walls. The men were falling dead and wounded all round me, but I was untouched until near the close of the fight in the streets. I was struck by a bullet, and fell fainting by a wall-side. I lay there unable to move myself, for my senses seemed deadened and my limbs powerless. But I seemed to see what was going on in a sort of trance, and I often afterwards prayed God to give me the belief that what I saw after the battle was over was only a hideous dream, for it seemed to me as if pandemonium had broken loose in the uniforms of British soldiers. Mad yelling figures seemed to rush past, struggling with each other with deadly blows and shots; killing innocent people, killing each other; rushing in and out the houses and wine-shops, careering with drunken gestures amongst the flames kindled by their own hands. All this, and much more too fearful to think of, I seemed to see hour after hour, all through the beautiful night of a southern spring; and I have been told that what I saw in sickly fancy was a sad reality, and that the demoniac work went on not for hours only but days, before the madness of the soldiers could be checked.

But before daybreak, I crept into a recess near me; and I remembered nothing more until I woke up in hospital. One of those lying near me was raving and moaning in piteous agony. I crawled over to him and arranged his rough pillow as well as I could. As I did so, his eyes turned upon me and met mine—it was Willy! I felt as if turned to stone, so little did I think to see him there. Yet there he lay, wounded badly, almost dying, as I could see very well. He did not recognise me, but asked piteously for water. After the first shock, I felt a great rush of tenderness and pity for him, and I swore to myself that he should not die if human care, such as I could give, would avail to save him. It was fearful to think of him lying there so shattered, and I with a mere flesh-

wound—I, that would have died for him; for what, I thought, was my life in comparison with his, and the calamity that his death would be to Joy. I tended him night and day for a long time, until one day his hand crept on to mine, and I saw the old look in his eyes, that I had not seen for many a long day, not since we were boys at the river-side by the mill. I made motions to him not to distress himself by trying to talk, and he smiled and held to my hand, falling asleep with it in his clasp. I sat there for hours, not daring to release my hand, lest he should awake, and be robbed of the sweet sleep that was like an in-drinking of new life to him.

He recovered very slowly; and before he was out of all danger, I was laid down again in another room by an attack of exhaustive fever, so that I did not see him again for some time, and then we just met for a while, before we were sent with a great many others to the coast, to be sent on the sick-list to England. He was full of kindly feeling towards me, just like his old self; and I forgot for the moment that I was but a corporal and he a lieutenant, until we were separated and met again on board the same ship. It seemed a ship of shadows; and it was a melancholy voyage, for numbers of men died on the passage, and there were burials in the sea every day. But it was a voyage of happiness to me, for Willy and I were together constantly, in spite of the difference in rank. He said, truly enough, that the time had gone by for thinking of that, and persisted in declaring I had saved his life. There was one subject which we both avoided talking about; he never alluded to it in the least, and I dared not: that was Joy Harding. I knew not how matters were between them; but some instinct told me that, whether they were engaged or not, he had not a tithe of the great love and reverence for her that I had. I felt that this was so, without ever a word exchanged between us on the subject. Nor did we ever allude in any way to our quarrel in the Hall avenue, for that would have led us to the verge of a subject that, with mutual feeling, we avoided.

I did not proceed home at once when we arrived in England; and before I left Portsmouth, I received a letter from Willy, informing me that Uncle Stephen was dead, and inclosing a letter he had left for me, in which he addressed me as a son, and which contained not a word of blame for my ungrateful conduct in leaving him in his old age. I felt all the grief and painful remorse that men feel if they have hearts at all, when they discover, too late, the measure of ingratitude towards those they love and who have loved them.

Uncle Stephen, to my considerable surprise, had left me a great deal of property, but the mill itself and all the family relics came to Willy. I wrote home at once to Willy, and told him I would accept not a farthing of that which naturally belonged to him. But he wrote back to say there was no help for it, and that I had better say no more about it, and urged me to come home; but I had no heart for that; so I remained at my duty in the garrison of Portsmouth to which I was attached; and there I remained about a year, when the news came that the fighting had ended at Toulouse, and that the victorious army was ordered home. I then applied to be allowed to buy my discharge; and after long delay I was free, and very glad I was, for soldiering was not to

my taste, and I never even enjoyed helping to astonish the French.

I went down to the old village, and the first place I called at was the cottage of old Bill Stubbs. The good old fellow was wearing out fast, and had become very feeble indeed. He was sitting by the fireside; but he rose to greet me, at the 'salute,' grasping me by the hand, and calling me comrade; and, for the first time, I felt proud of all I had gone through. He pointed with a shaky finger to the well-known little cupboard in the corner; and I took therefrom an old square Dutch bottle and glass; and we pledged ourselves, our country, and our king; to which toasts Bill proposed to add several admirals and generals. But I said 'No' to that; for, said I, if we pledged all the brave, it was not in the power of even a Dutch bottle, high-shouldered as it was, to hold out. But old Bill would have his way; and so we drank to our splendid chiefs all round.

Many a talk old Bill and I had after that about the wars—my war and his war. Many a time did I find my way to that snug little cottage of his amongst the trees, and once not alone. But that was long after, and not long before old Bill's death; and then I stood afar off, whilst an angel-woman sat at the old friend's bedside, and touched his good heart with kind gentle words, and wholesome reminding of the last great roll-call which must come to each and all of us.

I was installed as manager at the mill with old Hannah, who never wearied of telling me about Uncle Stephen, and how nobly he had lived out his life to the end; and how Miss Joy from the Hall used to come constantly to see him, and have long talks with him, and what they said to each other; and how that one day Uncle Stephen shewed her a letter, and that she cried over it as though it would break her heart. That letter was my confession of hopeless love.

Willy came the next day to see me, as I was amongst the men, and after a hearty greeting, said that some one was wishing to see me in the house. I did not look into the old parlour window as I passed it, but I knew well who stood beyond it; my wilful heart told me that readily enough. I knew not whether to blame Willy or not for thus re-opening the wounds of my heart. Indeed, I could not, for I was yearning to see her once more. This I said to myself as I entered the house: 'Once again, once more let me look upon her face; then let me go away and hide me and my rebellious care for her, and conquer it.' I stopped a moment at the door, and tried to school my feelings; but ah me! when I entered the room, my fluttering wits fled altogether with a great sobbing sigh, and I sank on my knees at her feet, and kissed her outstretched hands. It was an instant of wild happiness, and I could not resist doing as I did, for at that moment I forgot everything except my own unutterable love. Like a flood, it swept away every thought of my own unworthiness, and all proper sense of my own selfish shortcomings.

She allowed me to kiss her hands again and again, before she gently withdrew them from my close clasp. 'Do not kneel,' she said; 'not to me;' and then she paused and spoke my Christian name—Edward, almost in a whisper.

I looked up very quickly at that, and my face, which all my life long befuddled me, must have

shewn quite suddenly a very different look in it, for she blushed and turned away her head, and walked nearer the window, but not before I saw she had tears in her eyes. I don't know what I might have said to that, or what folly I might have been guilty of, but just at that time Willy shewed in sight outside of the window, and stood there amongst the ducks with the handle of his cane in his mouth; and the sudden sight of him brought me quickly from heaven to earth again.

Joy turned to me with a smile, and said: 'I am so glad to see you again, and Willy back again too—poor Willy!'

I was standing by her side, and had found my tongue again, and so I thanked her for thinking kindly of me, and said I did not deserve it, after quarrelling with Willy, her cousin and my own dear friend.

'Ah, but you saved his life,' she said, and a beautiful light shone in her blue eyes. 'It was noble of you.'

I stood staring at her in foolish rapture, but with never a word to help me. But she never made as though she saw my confused absence of mind, although, after I had gazed upon her for what seemed to me a wonderfully short time, she said we should go to join Willy, who did not seem inclined to come in. 'Perhaps he does not remember we are here,' she said. Joy drew down her veil, and I attended Willy and her to the gate; the geese and other poultry attending also with noise and clatter, for Joy had been in the habit of feeding them when she visited the mill, and they could not forget it. Garth also, the son of Haco, howled so that I was obliged, out of sheer pity, to let him fawn at her feet, and hold up his great head to her caressing hand. All things loved Joy.

Everybody in our parish made a great deal of me after I came back from soldiering. It was wonderful the respect that was paid me; and I was invited out so much that I had frequent opportunities for noticing that my appetite was not what it had been. Indeed, when the heart is full, I have always pitied the stomach.

After that day at the mill, I met Joy often and often; at first by chance, and then by design, at least on my side; and one day, I know not how it was, but when she looked straight up at me in the lane, I just put out my arms and took her to my heart, and drew her close, and held her tight there, until she was ashamed for me, and gently bade me let her go. Then I told her I would, but could not by any means just then let her go from me, and she sighed, for she had lost all her liveliness and stately ways. I told her very freely, when I did find courage to address her, of my heart's stound, and that live I could not if she reproved me for loving her, for I could not help it. It seemed, I said, natural, like living and breathing; and I implored her to say if I could ever be worthy of a return; and what I could do to deserve such love as only she, in all the wide open world, could give me. This I said, all the time holding her close to my breast, and feeling her heart beating with mine.

She sighed again and again, with her head turned half away from mine. But she never interrupted me to stop the words I spoke. At last she put up her hands to her face, and sobbed and broke out weeping sadly and violently.

I thought I must have offended her, and said so, and hardly knew what to do or say except to ask her pardon again and again for having upset her feelings so. But she said 'No,' and looked into my eyes; and my arms moved round her waist again, and our lips met for one rapturous moment; and she laid her beloved head upon my shoulder, calling me her hero—her good-hearted, brave Edward, and allowing me more kisses, until I forgot altogether that I was on earth and in a country lane, where at any time we might be seen by mortal men and women, not to mention village boys, who had seen us walking together before, and had published it far and wide. But Joy remembered where we were too soon, I thought, and left me very hastily with a promise to meet again.

I could not after this settle down in any way, and I felt that the crisis of my fate had come. Therefore, when next I met Joy, I told her that now the sober colour of the world had changed, and that everything I looked upon seemed different to my eyes, because of the new light that was everywhere. The songs of the birds and the sighing winds whispered the o'ercome, 'Joy, joy.'

Joy made the acknowledgment, but always timidly and with a sinking heart, for I know afterwards how greatly she feared that her uncle the squire would not approve. However, I presented myself one morning at the Hall, having first consulted Willy concerning the step I was about to take.

The squire received me very kindly, and reproached me for my negligence in not calling upon him long before; but when I, without parley, opened upon him on the subject of my calling, then the genial lines of his face seemed suddenly to become rigid, and his pleasant smile vanished like a sunbeam in the angry blast. He rose from his chair and stared at me, and I rose from mine, feeling that I could talk better standing. He rang the bell, and ordered the servant to request Joy and Willy to come to him. Joy came in leaning on her soldier's arm, looking sadly at me with tearful eyes. She sank down in a big easy-chair, and Willy stood by her side, giving me a kind look and cheerful good-day. Then the squire commenced to talk; but for the first few minutes he might as well have talked to a horse, for although I heard the words plainly enough, their sense was lost, for my faculties and understanding were prostrate in the presence of my adored. I rallied somewhat at the words 'presumption and ingratitude;' and at that point I listened to the old gentleman, still looking at Joy, who signalled me to be good and calm; and I declared to myself that, for her sake and Willy's, I would say nothing to Squire Harding that was not respectful. Ingratitude! Full well I might have asked him for what I was ungrateful; as I never had had or desired anything from him, until now that I wanted for myself his greatest treasure. He at last talked himself out of all self-command, and said he, 'Have you nothing to say in defence of your unmanly conduct, Edward Thane?'

I said: 'No; only this, sir—that it is true I love Joy, and she loves me; and I wish to marry her at once, if she will take me for her husband, and if you please.'

Joy uttered a faint cry of alarm; and the squire was so thunder-struck, that instead of grasping my

hand, as he might have done, he sat down and glared at me, becoming quite pale. He cut me short with a violent exclamation before I had well finished what I had to say.

Joy cried out piteously to him, and crept down at his feet, clasping her hands around his knees. 'Indeed, indeed, it is true,' she said; 'Edward could not speak a lie;' and then she hid her sweet face in her hands, still kneeling at his feet.

'Girl, you are a perfect little fool,' he said in great anger.

Joy sprang to her feet, and I was at her side in a twinkling, and she put her hand in mine.

'Squire Harding,' I said, 'Joy has chosen her choice;' and before Heaven I swear that her choice shall be her happiness from now to the grave, and beyond that, who knows! Not for all the squires in England will I give her up; neither will I leave her here, even in your own house, till she herself gives me the word of command.'

Joy, before I had quite done with my speech, placed one dimpled hand on my lips, so that the latter part of the longest speech I ever made was sweetly smothered thereby.

The squire rose from his seat and pointed to the door, laying his hand at the same time on the bell-rope. His face was white-bleached with anger; but my temper rose not a peg-hole. I stood still until Joy whispered me to go, and whispered another word or two also which made my ear tingle to hear. Willy also came between the squire and me, and laid his hand kindly on my arm, and so between them they drew me away from the room. I fain would have held Joy a moment by herself outside of the room-door, but she escaped from me for that time.

I walked home ill at ease; but as I went, my mind seemed to take in other and higher thoughts, and there grew within me the great assurance of my requited love—mine and Joy's, now for ever one, in spite of all the small world of those who might disapprove, and of those who should cry shame upon my aspiring mind. I could not go home to the mill for long that night. Again I walked under the stars of the open heaven as once before I did, in cruel distress of mind.

The very next morning after my appearance at the Hall, as I was impatiently waiting for some sign from Willy, two letters were put into my hand. One was from Willy, and the other from the squire. Mr Harding's letter was cold and formal, but polite. He commenced with an expression of regret for his hasty reception of me the day before; but he went on to say that a marriage with Joy was quite impossible, such was the difference in our worldly stations. He advised me, as a young man in whom he had confidence, and for whom he had regard, to put aside such ill-regulated ideas, and apply myself to my business. Joy, he said, would at once leave the neighbourhood on a long visit to her mother's relations in the south, so that any further attempt to hold communication with her would be useless.

It seemed, when I read this, as if a thrust of steel had reached my heart. 'Oh! cruel, cruel he is,' I moaned, 'to part us!' I felt for a time quite unmanned, and as though a whole cold, selfish world had come between Joy and me. A hard, mocking, scheming, money-loving world, against which I felt my own powerlessness in a dull sort of way, that, as I said, quite for a while bore me down. I seated

myself in a corner of the mill, where the men were working, with the buzz of the machinery all about me, and I tried to think; for if thought came to me anywhere, it was in the mill. After a while, I bethought me of Willy's unopened letter, which I still held in my hand, and as I read it, a faint ray of hope came to me, for he told me he was still my true friend, and that, if I could have patience, he would serve me well in this matter. 'I did you grave injustice once,' he wrote, 'and I will do no less than justice now; but let me beg of you to do nothing rash.' He promised to see me soon, but that for the present time the squire kept him always about him. Joy, he said, did not dare to leave the house, and was forbidden to see me. But she sent a few precious words in Willy's letter that comforted me much.

I could scarcely restrain myself from rising in rebellion against the injustice of the squire. But I knew I could do nothing except range about all day—and very nearly all night too—in the old familiar walks; and that same night, Rice Newton the game-keeper, and Wallace his dog, went so far as to grapple with me in the shadow of the trees, thinking I was a poacher.

The next day, Joy was taken away, and I was helpless to prevent it; and so was Joy herself, for she was under age. Indeed, her gentle nature, I knew, had been quelled out of all thought of resistance by the squire. I saw nothing of her, in spite of all attempts to do so, and I was nearly broken-hearted. Willy came to the mill, and told me how sorrowful Joy was to go; but a quiet, uncomplaining spirit possessed her, so that the squire imagined her feelings to be but little touched. She sent a few tender lines of farewell to me. They lie before me now as I write. Often do I take them out of their quiet resting-place, and gaze at them until the old deep springs, far down in my inmost heart, are loosed once more, and my eyes grow dim with tears. I told Willy that nothing would hold me, but that I would follow her; and he implored me not to do so, but to have confidence in him, that he would endeavour for me, and all would yet be well. At last, I yielded so far as to promise not to do anything so foolish; but I knew I could not keep my promise very long, such was the agonising unrest of my heart.

I need not say much more about the few weeks of suspense I spent at that time. But now and again I was cheered by messages of affection from Joy, which were forwarded through Willy, for she was watched almost like a prisoner. At last she wrote to me a few lines so despondingly that I was startled; for I felt sure something was wrong, and rest I could not until I had seen her again. So I set out for the south, little thinking that Willy was already on his way to fetch me. Yet, so it was; for he arrived at the mill the day after I left. He came quickly posting after me, and overtook me at a wayside inn, just before I arrived at my destination, and told me the news—such news of gladness! It was a long story before all was told, but few words will suffice for it here.

The squire, after leaving Joy with her relations, had gone to London, and was delayed there some weeks with business, and had then gone back to Joy on his way home. But he found her ill and drooping. My poor Joy! The good-hearted

squire was thunder-struck; and he then and there said it was past all comprehension. But he took her to his heart again for all that; and Willy said he cried over her, and blamed himself very heartily for all that had taken place; and that Joy clung to him sobbing and declaring she would never leave him, not even for me.

The squire shook his head very sadly at that, and with grief in his voice, he declared that she should have her will in everything for the future. Then Mr Harding and Willy consulted together; and then it was that Willy played what he afterwards called his trump card—and that card was Edward Thane. The squire was hard to win over; but Willy pleaded so well for me that he gave way at last, and when he did give in he did so generously, as became his nature. Willy at once got permission to fetch me, and as I have said, we met at the wayside inn, and before long I was standing in the hall, where stood the squire, grasping his freely given hand.

We had a long talk together about many things, but it was concluded satisfactorily. I was to have Joy, and to all else I was indifferent. But great was the chill of disappointment that came over me when I was told I could not see her just then until all had been finally settled. It seems that it had been resolved to keep my visit a secret from Joy; but I was promised that all would be as I should desire very soon; so I was obliged to be satisfied with this, although I left the house with a reluctant step, but still with a light heart.

Not long after this the squire himself called upon me at the mill with Joy; and in Uncle Stephen's old oak parlour her hand was placed in mine. I remember it was a gloomy winter day; but the little dark room was radiant to my eyes, radiant enough with abounding sunshine. Joy said but little; her heart was too full for speech; but I had only to look down into the calm depth of her beautiful eyes, to read there the divine contentment of truest affection.

The squire seemed quite satisfied with the turn that events had taken, and we all walked up the lane together, I walking with them to the Hall, where Willy joined us, and we were all happy together. The cloud of the past seemed to have rolled away for ever; and the future seemed to me, as I thought it all over that night in my solitary chamber at the mill, to be a long, long path before me, with the bright white light of happiness upon it. Down that long and happy path I seemed to see Joy and myself walking on and on; never looking back; never apart, but always onward in the encircling glow of perfect content. Alas! alas!

Joy and I were formally engaged to be married within the year, and of course we met very often, and all restraint was taken away from my visits.

Mr Harding and I became close friends, and I saw in him the clear soul of the true English gentleman.

Smoothly ran the course of love with Joy and me. Like the sweet stillness of a summer day our two lives seemed hushed with the steadfast brightness of the golden present. And the future was to us brighter and more golden still. At last the day of our wedding drew near, and the guests were invited; and just then it was that the news came that Willy's regiment was ordered abroad, and it was a great blow to us that he could not be present

at our marriage. There was one honoured guest, however, that Joy and I resolved should be there, and that was our old friend Bill Stubbs. Joy and I had frequently visited him, and one day we invited him to our wedding; nor would we take a refusal. The dear old boy looked down at his battered wooden leg, and said it was too far gone for such gay affairs as weddings. He declared that Wantless, the carpenter, should make him a new one for the occasion. But I said no to that; for it was the leg I had always known, and he would not have seemed himself with any other.

We were married, and lived at the mill; for it was Joy's own wish, and both the squire and myself agreed that it was better so. Joy loved the dear old place; and the proudest man was I in all the North that day when I brought home to it my bride. My own sweet wife at last.

Brief must now be the remaining part of my story, of my life-history; for I find that not even the fortitude that comes with time can shut out the heavy pain that still has power to rack my heart when I sit down to think of my affliction. God help me! I cannot, even now, after all the long sorrow of years, find comfort in resignation. With a contrite heart for my blamable shortcoming do I say this. But it would be false to say otherwise.

Brief indeed was our married life. But two short years, and I laid my darling in the green churchyard, with her new-born infant by her side.

Joy, my lost darling! Ah! not lost, but watching and waiting for me. Often in the night, when all is still, I look out heavenwards to the glittering stars, and I wonder if beyond the visible world you are looking down upon the old home where we were happy together; and I try if by wistful yearning of the heart, a yearning that is prayer, I may gain a passing sight of you. And sometimes I imagine I have seen you, dear love! with arms outstretched to me across the endless gulf of space, and then it is that I believe you have besought for me in my loneliness a blessing from the Supreme. Lonely indeed! for all are gone, and I only am left of all who are mentioned here. And I am old; and before long I must go also, trusting in God's great mercy, as I have learned to do.

THE END.

THE MONTH: SCIENCE AND ARTS.

THE instrument invented by Mr C. W. Siemens, F.R.S., for ascertaining the depth of the sea without a sounding-line may be generally described as resembling the barometer in construction, inasmuch as it has a perpendicular tube filled with mercury. The tube has a saucer-like termination at each end; the lower end is closed by a thin elastic steel plate, which is supported on two spiral springs of the same length as the mercurial column.

The pressure of the mercury on the thin steel plate varies with the gravity, and that varies with the depth of the sea. When there is downward pressure there is diminution of mercury in the upper saucer, and *vice versa*. A thin layer of paraffine floating on the mercury, enters a flat spiral tube of glass on the top of the instrument, and advances or recedes with the rise and fall of

the mercury, and thus indicates on a scale the depth of the sea in fathoms at any moment.

The density of the earth is, roughly speaking, twice that of sea-water; hence the varying effect of gravity, and the possibility of inventing the bathometer, as this new depth-measurer is called.

Mr Siemens has tested his bathometer in two voyages across the Atlantic, by comparing its indications with actual soundings. 'The results,' he says, 'agree in all cases as closely as could have been expected, considering that the sounding-line gives the depth immediately below the vessel, whereas the bathometer gives the mean depth taken over a certain area.' On an even slope the two might be expected to agree; and if we had charts with contour-lines of the depth, a captain would be able to ascertain the position of his ship during fogs, or in weather when astronomical observations could not be taken. An instrument that gives warning of changes of depth long before reaching dangerous ground, cannot fail to be turned to good account. Moreover, a knowledge of the depth can be taken advantage of mechanically as well as scientifically. During the laying of one of the Atlantic cables, the end was lost in a gale, and the spot could only be guessed at, but the depth, eight hundred fathoms, was known. On return of fine weather, an attempt at recovery was made. Soundings were taken, until eight hundred fathoms were struck, and along this range the groping was continued, until at last the cable was hooked, twenty-seven miles from the spot where the search commenced. And further, we may believe that coast surveys, and deep-sea exploration for whatever purpose, will be greatly facilitated by means of the bathometer.

In the two voyages above referred to, the test-soundings were taken by Sir William Thomson's apparatus, which makes use of a thin steel wire for a sounding-line, and gives more trustworthy results with less expenditure of time than the usual method of sounding. We hope the day is not distant when the steel wire will be adopted in the royal navy.

On describing his bathometer at a meeting of the Royal Society, Mr Siemens illustrated the principle by another instrument, which may be called an attraction-meter. It is composed of three tubes put together in the form of the letter H. Mercury is poured in, and above that spirit of wine, until the tubes are quite full. A slender tube of glass is fixed above the central tube; the spirit enters this tube, and carries with it an air-bubble which serves as indicator. If, now, a heavy weight is placed near either of the side-tubes, the mercury is attracted or drawn towards that side. The floating spirit is consequently raised; it enters the glass tube and pushes the air-bubble away from the weight. An ordinary observer, on seeing the experiment, would conclude that the weight had repelled the air-bubble; but the philosopher perceives the effect of attraction: of weight on weight, and mass on mass. The principle of the bathometer is therefore shewn to be true.

A special merit of this attraction-meter is, that when properly constructed, it would keep in working order perhaps fifty years; but it must be securely fixed on a base imbedded in the earth firm as a rock. Placed thus, with the central tube pointing east and west, it might be used for

scientific purposes: to indicate the rise and fall of tides, the movements of the moon, and other physical phenomena. Mr Siemens may be congratulated on having, in these two instruments, made an important addition to the resources of science.

Mr Rymer Jones, of the imperial government telegraphs, Japan, has invented apparatus for ascertaining the temperature of the sea, and the direction and velocity of its currents at any depth. As this apparatus cannot be described without diagrams, we mention only that it involves the use of a magnet, a vane of insulators, and of electric communications, by which the desired facts are made known from deep down under water to the observer on board ship. A sinker is used to insure steady descent of the apparatus in an upright position, and is then cast loose, the cost of a sinker being less than the cost of the time required to haul it up.

As our readers are aware, there has been much discussion of late about oceanic circulation and deep-sea currents. Researches into those phenomena would be facilitated by means of the instruments here described; and it may be that the explorers on board the *Challenger*, now coming home from their three years' interesting cruise, will wish that such appliances had been available at the commencement of their voyage.

Sir William Thomson, F.R.S., and his brother, Professor James Thomson, have invented a 'mechanical integrator,' which does surprising things in solving mathematical problems. It will calculate integrals; integrate linear differential equations, and perform other numerical feats much quicker than they can be done by the brain, and without mistake. The same two skilful investigators have devised an analysing machine suitable for working out the harmonic analysis of meteorological observations and of tidal observations. It is a prime thing for science when, by turning a handle for half an hour, and setting a few wheels in movement, a whole year's tide observations can be presented in a compact form for lasting reference.

One of the results of Mr Crookes' investigations is confirmation of the theory that there is no difference between heat and light. 'All we can take account of,' he says, in technical phrase, 'is difference of wave-length. A ray of definite refrangibility cannot be split up into two rays, one being heat and one light. A ray of definite refrangibility in the red, falling on a thermometer, shows the action of heat; on a thermopile, it produces an electric current; on a photographic plate it excites chemical action, it occasions movement in a slice of suspended pith, while to the eye it appears as light and colour.'

As regards the 'weighing of light,' some explanation is necessary. It must be remembered that all Mr Crookes' experiments are made in a vacuum. He twists a fibre of glass and fixes it in his tube. With another fibre and pieces of pith he makes an almost inconceivably light balance, which is attached to the twisted fibre with liberty to move. If a beam of light be made to fall on one end of the balance, it is pressed downwards as by a weight, and the amount can be calculated. But as light has no weight, it is the force of the light which sends the balance down. Therefore, it will be understood that weighing a sunbeam is not the same thing as weighing substances which

have weight. During the course of the experiments in December last, it was calculated on a cloudy day, that the pressure of sunlight on the earth amounted to a little more than two tons per square mile. The question as to whether this pressure, or force, can be turned to practical uses has often been raised. A Frenchman thinks he has solved the problem by shewing that sunshine can be made to heat water in a boiler and get up steam.

Taken by itself, Mr Crookes' torsion-balance is a remarkable instrument, for it is the most delicate balance ever yet constructed. The scale can be turned by a weight not more than a millionth of a grain. This would seem to be the utmost limit to which weighing could be carried or required. Considering that the experiments were made in a vacuum, it may be queried—How was the weight placed on the scale? The answer is that the weight was already in the tube; that it was lifted by a magnet on the outside of the glass, and when exactly over the scale was allowed to drop.

Certain solutions, as is well known, when submitted to experiment, rotate polarised light. Quinine is one of them, and from its peculiar properties, has often been put to the test in the chemical laboratory. In the course of a recent investigation, Professor Draper of New York found that by adding a small quantity of sulphuric acid to the solution, the rotating power was increased from one hundred and fifty-four to two hundred and fifty-five. Thinking over this augmentation of power, he was led to ask the question: 'Is it not possible, nay, even probable, that the physiological action of quinine may undergo a similar or perhaps greater increase? In past times, it was the custom to administer the drug in the form of a sulphuric acid solution, and the results were certain and prompt even with minute doses. In recent times, on the contrary, the fancy of patients demands that quinine should be given in pill or some allied form; and though greatly increased doses are used, the practitioner finds it less certain in its effect. The cause of the difference is doubtless the change in molecular arrangement that produces the marked difference in the action of the alkaloid and sulphate solutions on polarised light; and since the action of the sulphate solution is so much greater than that of the alkaloid solution, it is evidently the proper form for the administration of quinine as a medicine.'

In some of the hospitals in America, dilute solution of carbolic acid has been successfully used as a remedy for acute rheumatism. An ounce of the acid is mixed in a pailful of warm water; blankets are then dipped into the pail, and, after being slightly wrung, are wrapped round the patient. It is said that a feeling of relief is soon experienced.

In a recent railway collision, between Philadelphia and New York, great damage was done to the trucks and carriages of the two trains; but the passengers in two Pullman drawing-room cars escaped unhurt. An American writer describes the amount of resistance in the framing of those cars as something enormous. The sills or floors are made of the best 'Southern pine,' the 'crushing stress of which cannot be less than six thousand pounds per square inch,' or nearly one million and a half of pounds for the whole floor. The floors

project at the ends, and thus the shock of collision is dissipated before it reaches the body of the car; and as there are no doors along the sides, the Pullman cars are much stronger than English railway carriages. The writer above quoted remarks: 'We say confidently that we do not believe it is possible to build cars with compartments and side-doors that can in any way approach the strength of the long American car with end-doors. The whole floor and side as far as the window-sills is a unit, and the amount of resistance which is offered is something extraordinary when compared with the coaches used on foreign railroads.' When the collision occurred, the train with the Pullman cars was travelling forty miles an hour.—'Facing points' on railways and tramways are an occasion of danger. These facing points are the wedge-like bars of the switches, used where carriages are shunted. At Middlesborough, the constructors of the tramway, instead of placing the points exactly opposite each other, as is usual, have placed one a few inches forward. The wheels, therefore, pass over one at a time, and thus avoid the risk of meeting two at once.

Mr Alexander Buchan's paper, reprinted from the Transactions of the Royal Society of Edinburgh, 'On the Diurnal Oscillations of the Barometer,' is worth reading by observers who take interest in questions of weather and climate. This rise and fall of the barometer of course indicates a rise and fall of the atmosphere—an aerial tide—and its presence has been remarked wherever observations have been made. It is greatest between the tropics, and diminishes towards the poles. At Bombay, for example, the oscillation is at its lowest at 4 A.M.; then it rises, and is at its highest at 10 A.M., from which it descends to the lowest level by 4 P.M., and so up and down every six hours. This tide, prevailing all round the globe, must play an important part in the economy of nature. What that part is, might be found out if we knew more about the diurnal oscillations; but to obtain this knowledge, systematic and long-continued observations in all parts of the world would have to be made. Other natural phenomena, as Mr Buchan remarks, would have to be taken into account: 'the effects of solar and terrestrial radiation, of currents of air, and possibly also of electro-magnetic conditions, as modified in each locality by the relative distribution of land and water. The development of this question,' he continues, 'would be most materially furthered by establishing in different parts of the globe strings of stations extending from the sea-shore inland for thirty or forty miles; and it may be added, that with observations obtained from stations so planted, the investigation of the important question of seaside and other local climates would be most satisfactorily carried out, since it would thereby be placed on a strictly scientific basis.' Could not the Treasury Committee who are now inquiring into the working of the Meteorological Office take this matter into consideration?

The claims of physical and mechanical science have proved so strong this month, that we have but small space left for other topics deserving of notice; for example, the loan collection of scientific instruments which is to be a public exhibition at South Kensington. It will include some of the contrivances by which great discoveries have been

made, but will have little attraction for ordinary sight-seers.—Then there is a grand scheme for establishing a large number of scholarships, forty pounds each, in connection with the National Training School for Music. This school is to be opened after Easter; and under certain conditions, young persons of musical abilities will be there trained in music free of cost. A case has recently occurred in Northumberland, where a boy nine years of age shewed himself to be the best among a hundred musical competitors.—Schemes for improved dwellings for working people are also much talked about: the Royal Institute of British Architects, the Metropolitan Board of Works, and the Corporation of the City, have all held discussions thereupon.—Then we hear of a new gun-metal which surpasses all other gun-metal in strength, and breaks only when the strain exceeds thirty tons to the inch. And guns grow bigger and bigger, and we are told that soon we shall have five-ton cannon-balls, and cannon able to fire them. —And lastly, the slag of blast-furnaces is now made into a kind of cotton, which is incombustible, and is an excellent packing for steam-boilers and heating-apparatus, when the heat is to be kept in.

In reply to a question in the 'Month' for January, in this *Journal*, regarding the edibility of rats, we have been favoured by a clergyman in the west of England, with the following:

'In the year 1834-5, I was on board ship at Port-Louis in the Mauritius, when it was found necessary to smoke the hold out, to get rid of the rats that infested the ship. Three hundred and ninety rats were found suffocated round the fires. A French third-mate who was on board proposed to cook, and actually did cook, some of the finest of them. These I tasted, and indeed ate of them. *Chiefly* the hind-legs were eaten. They were exceedingly white, delicate, and tender, and as far as I remember put me in mind of chicken, with a slight flavour of game about it. They had been well nourished, and were plump and in good condition. I would not object to eat them perfectly prepared, and should regard such food as a great boon after salt-junk and pickled pork of six years' storing. If I am not mistaken, the Frenchman fried them, after carefully cleaning. I think it possible that the sulphur which had been used for smoking the ship may have helped to give a slightly modified flavour to them; but it was not sufficient to be at all disagreeable.'

Another correspondent kindly writes as follows: 'Some forty years ago, my late husband had a pie made of rats, and I think five or six gentlemen dined with him and enjoyed it very much. The rats were caught in a barn where the wheat was just thrashed, so that they were very nice and tender from their feeding.'

LINES BY A LADY TO HER SONS.

I.

I COULD not sleep all through last night,
But sighed, and turned, and wished for light.
Then Memory opened secret cells,
And water sprang from hidden wells;
Then little feet danced up the stair,
And childish voices filled the air.
Now William calls his brother Frank,
While Robert plays some joyous prank;
With auburn curls, and look serene,
See Charley calmly views the scene.

There Walter stands, a thoughtful child,
And handsome Tommy, bright and wild.
One tiny maid, with starry eyes,
Amongst them plays, and laughs or cries.
Yes all once more I plainly see,
With little Edward on my knee;
Again my fair young sons are seven—
Alive on earth, the gift of heaven.

II.

We're in that quaint old house once more;
The orchard spreads its fragrant store.
The lofty elms whilst some ascend,
Their little gardens others tend;
To me they bring, half ripe, a treat,
No fruit has since seemed half so sweet.
The tutor rings; the boys all hide,
With anger feigned, I hear him chide;
A merry laugh betrays them all,
Who gravely answer now his call.
Oh, happy boys! oh, lovely spot!
Who might not envy now your lot?
But clouds hang o'er the dear old place,
And sorrow shadows each young face;
For Death has torn, in one sad year,
From that bright band two brothers dear.
But still, dear sons, I call you seven,
With five on earth, and two in heaven.

III.

Ah, me! to-night I cannot sleep,
Since Memory bids me wake and weep.
And, hark! I hear delightful notes;
Around my bed soft music floats;
How well I know 'tis Walter's hand!
Musician rare, at thy command
Delightful music filled the hour;
Entranced, we feel its deepest power.
Again I mark him fade away,
The soul so lighting that thin clay,
That ere he left us, all could trace
An angel's spirit in that face
And dark bright eyes, whose softened rays
Looked forward, with an earnest gaze,
As though he saw those mansions blest,
Where soon he found eternal rest.
But, still, dear sons, I called you seven,
With four on earth, and three in heaven.

IV.

I do not care for sleep to-night,
So come ye visions, dark or bright.
See there is Frank, and by his side,
At marriage feast, a fair young bride.
Now Robert speaks with youthful grace,
While laughter echoes round the place.
With grief repressed, I see once more,
Our Charles leave his native shore,
Beloved of all, we knew too well,
For years in Eastern climes to dwell.
Ah! maiden dear, those starry eyes
Another home than mine will prize!
Young Edward, too, though still with me,
Has dreams of lands beyond the sea,
But still I'm not of joy bereft,
Their loving father's with me left,
And hopes our girl and brothers seven,
Will at the last all meet in heaven.

STORY OF THE HERSCHELS.

WHEN, in the summer of 1714, George I. left his Electorate of Hanover to ascend the throne of England, he did not, as is well known, sever connection with his continental dominion. He, and his son after him, George II., frequently took a trip to Hanover, where a certain royal state was maintained. If the Elector was not there in person, he was at least represented by his picture, to which, on particular occasions, the courtiers ceremoniously bowed an expression of loyalty. There likewise continued to be kept up a body of Guards in handsome uniforms, possessing a band which played daily in front of the schloss or palace, just as if the Elector had been enjoying the music inside. It was altogether a splendid sham, and so it continued until our own times, when new regal arrangements were effected by the severance of connection with the crown of Great Britain.

To have a place in that well-appointed band of the Guards at Hanover, considerable proficiency in playing some special instrument was required. No ordinary player even on a drum would be accepted. In 1731, there happened to be a vacancy in the situation of hautboy-player. Several applied for this enviable position, among others Isaac Herschel, a young man twenty-four years of age, who had played in bands at Potsdam and Berlin, and with such success, that he was selected for the appointment. Isaac was the youngest son of a gardener at Dresden, and his father wished him to follow his own profession; but with a passionate love of music, he determined to be a hautboy-player; and so here he settled down as a member of the band, and almost immediately married; the young woman he chose for wife being a steady, intelligent person, with a good knowledge of housekeeping. It proved a good match. The pair had ten children, four of whom died in childhood. The remaining six, four sons and two daughters, did not all shew the same aptitude in their education. The genius of the father for music, scientific tastes, and readiness in mastering languages, was inherited by one of the sons, William, born in

1738; while, along with a similar genius, one of the daughters, Caroline Lucretia, born in 1750, partook of her mother's habits of industry and tact in management. It was a clever family generally, but two only, William and Caroline, rose to distinction by their splendid talents, and on these two we purpose to concentrate attention.

Rising to the position of band-master, Isaac, the father, was somewhat improved in circumstances, and all was going on pleasantly, when the war broke out which led to the battle of Dettingen, 1743, at which George II. was present with his Hanoverian Guards. The band, of course, also took part in the affray, which was happily crowned with victory; but the troops remained all night on the field, soaked with rain, and the unfortunate band-master lay in a wet furrow, from which he rose with an impaired constitution, which afflicted him to the end of his life, and threw a gloom over the family prospects. It might be a very fine victory that battle of Dettingen, but it proved a bad business for the Herschels. Fortunately, as the father declined in health, the boys were growing up, and good for something as regards ways and means. Music was their forte. One of them got a job as an organist to a chapel. Caroline learned to play on the violin. William was placed in the band, in which position he was ordered to England in 1755. He was absent for a year. The expedition had been in several ways advantageous. He saw the world, and learned to speak and read English with fluency. His tastes had taken their bent from his father's scientific disquisitions. The old man, though afflicted with asthma and rheumatism, often gathered his children about him, and explained the starry and planetary system. William and Caroline took deep interest in these lessons on astronomy. By the time Caroline was ten years old, she could tell the constellations, and knew how to scrutinise the heavens with a telescope. No instructions of this kind, however, diverted her from daily domestic duties. She knitted stockings for the family, made clothes for a little brother, assisted in cookery, and at every spare moment copied music for her father. She

had been taught to write, which few women were at that time, and, as an act of kindness, she wrote the letters of wives to their husbands at a distance with the army.

Meanwhile, William gave up his situation in the band, and retired into civil life. Soldiering was too severe a strain on his constitution. He also quitted Germany, and took up his residence in England, which he resolved should be henceforth his home, for it afforded scope for the exercise of his talents as a teacher of music. He settled first at Leeds, from which he went to Halifax as organist, and subsequently he removed to Bath. In 1764 he made a short visit to Hanover, and there he saw his father for the last time. The old man—yet not very old, only sixty-one years of age—died in 1767, leaving to his children the heritage of his good example and an unblemished reputation. The loss was severely felt by Caroline. Her prospects were blank. She had learned no fashionable accomplishments to qualify herself as a governess, and despondingly saw no suitable means of earning a livelihood. As an effort in this direction, she went to a ladies' school to learn 'fine work,' which did not come to much. Things had arrived at rather a bad pinch with the family, when one day came a letter from brother William, at Bath, proposing that Caroline should join him, as a singer for his winter concerts and oratorios. If, after a trial of two years, she did not like the place, she would be sent back. Here was an opening for this assiduous girl which could not be resisted. Independently of her attachment to her brother, she was anxious to follow some useful occupation. As for music generally, she had a fair knowledge. She could sing, but felt by no means able to take a part in concerto pieces. However, she would learn, and set about it immediately. When alone, she put a gag between her teeth and practised shakes with the voice, in which she became tolerably proficient. Before setting out for England, she knitted as many cotton stockings for her mother and little brother as would last them at least two years.

At length the day of departure arrived. It was on the 16th August 1772. And such a journey in comparison to what it would be in modern days! She travelled six days and nights in a post-wagon to Hellevoetsluis in Holland; then by packet in a stormy sea to Yarmouth. On reaching the coast, the vessel was wrecked, but Caroline with others saved themselves by crawling ashore, though with the discomfort of being drenched with sea-water. Misfortunes were not ended. She got a cart to take herself and trunk to meet a stage-coach for London. The horse ran off, and in its capers sent her and her trunk flying into a ditch. Fortunately, she suffered nothing worse than a fright. A gentleman with his servant rescued her, and saw her off in the stage. On the 26th she reached London; there she met her brother, and for the present her troubles were over. She got a good sleep, the first she had had for ten or eleven days,

and felt interested in the new scenes presented to her. As yet, she spoke English imperfectly, but with her acuteness this was a defect soon got over. Speedily her conversation could scarcely be distinguished from that of an Englishwoman.

With her brother, Caroline now went to Bath. She was to keep his house, make herself useful at his concerts, and, in fact, do anything that cast up. There was no demur to the various duties. The force of her attachment to her brother was something extraordinary. In tastes, sentiments, and a vehement spirit of industry, they were like one being. Scarcely had there been such a remarkable instance of cordiality in feeling, and union in pursuits, as that exemplified in the history of William and Caroline Herschel. The thought of this brotherly and sisterly affection fills the heart with emotion. In relation to her brother, Caroline had not an atom of selfishness. She would cheerfully toil night and day for him, ever forwarding his aims, rejoicing in his advancement. That she felt to be alike a duty and a pleasure. We shall immediately see what she did.

William Herschel had at this time attained a good position as a teacher of music at Bath. He had secured a number of pupils among ladies of rank, and to eke out his means he acted as organist to the Octagon Chapel. He was likewise director of the public concerts. His activity in these musical avocations was extraordinary. One way and another, he realised a good income, and, like many in similar circumstances, he might have lived and enjoyed himself, with no ulterior object in life. Herschel was contented to carry on for the meantime as a musician, because it was his means of livelihood. But his mind was set on something else. The lessons in astronomy that had been given by his father, had implanted in his mind an earnest desire to excel in that science. He purchased and read books on astronomy, but in that there was nothing practical. Excellence in any scientific pursuit depends on personal and original investigation. Herschel determined on examining the heavens methodically for himself. Wanting a telescope, and unable to afford a reflector, he made one—a Newtonian of five feet focal length, and with this he commenced an exhaustive study of the firmament, taking the groups of stars in regular series. The discoveries he made were considerable, and induced him to make researches with a telescope of greater power. So he commenced the construction of a twenty-foot reflector, by which minute characteristics might be distinguishable among the stars, nebulae, and planets. A reflecting telescope consists of a long tube with a mirror at the inner end, on which the objects looked at may be reflected. This mirror is usually made of a metal composed of copper and tin, capable of taking on a brilliant polish. The surface is concave, and ground to a parabolic curve. At a certain distance in front of the mirror, known as its focal distance, an image is formed in the air of the object to which the telescope is directed, and

it is this image that the observer looks at by means of an eye-glass, which magnifies it on the principle of the microscope. The mirror is, of course, the diameter of the tube, which will be probably two feet for an instrument twenty feet in length. 'Think of a man who has been all day teaching music, devoting half the night to making a gigantic telescope, which hardly a room in the house could accommodate! To pursue his labours with any advantage, he required a knowledge of mathematics and the art of calculating by logarithms, but he was already instructed in these branches of learning. Caroline, who had in a lesser degree taught herself mathematics, fell readily into the project of making a telescope which would excel everything else of the kind.

Here, then, about 1774, were these two Herschels busied in telescope-making. Mechanics were employed to assist, and the house for a time was almost turned into a workshop. A foundry was established in the back-garden. The beating of hammers was heard in the garret. There were turning-lathes in the bedrooms. The rasping of files went on in all directions. Caroline took her part in the general hubbub. Returning from a concert, in which she had acquitted herself as a vocalist, she would rapidly change her dress, put on a pair of old gloves, and work like a heroine until far on in the morning. The heaviest and most critical part of the manufacture was casting and polishing the mirror. William undertook the polishing. So eager was he that he did not even spare time to take food. Caroline waited on him, and put victuals into his mouth. Sometimes to amuse him during these monotonous labours, she read to him chapters from *Don Quixote*, or the works of Sterne and Fielding. Nothing but an intense enthusiasm, without which no sort of eminence is to be attained, could have borne up the mental and physical strain of the brother and sister.

They were rewarded. The twenty-foot telescope was a success. In 1781, William discovered Uranus, at first called the Georgium Sidus, one of the remoter planets. Men of science began to speak of his astronomical feats, and gladly welcomed him to their circle. He was elected a Fellow of the Royal Society, and for the few days he could spare from professional duties was introduced into the best society of London. The time had come for devoting himself entirely to astronomical pursuits. On Whit-Sunday 1782, he and his sister played and sang in public for the last time, at a chapel in Bath. Caroline had various requests to sing in oratorios at Bristol and elsewhere, but they were declined. She would not leave her brother. We thus fix 1782 as the turning-point in the history of the Herschels. Music was laid aside. Henceforth it was to be all astronomy, and there was a revelling in ideas of what might be mutually discovered. Bath had served its day, and was given up. The neighbourhood of London, well out of the fog and smoke, was resolved on as a place of residence. In coming to this determination, perhaps Herschel was influ-

enced by attentions shewn to him by George III. The king professed to be interested in his discoveries, and had a fancy to see his telescope, and appointed him to be Astronomer Royal, at a salary of four hundred pounds a year. Never, as was said, did monarch purchase honour more cheaply.

At first, the Herschels set themselves down in an old tumble-down house at Datchet, where there was considerable space for fabricating telescopes. To Caroline was assigned the special duty of examining the heavens nightly with the small Newtonian telescope, called 'a sweeper,' made by her brother. Gazing for hours intently, she was to 'sweep for comets,' or whatever seemed new and remarkable. The duty of standing on a dewy grass-plot till it might be two in the morning, searching for comets, or those cloud-looking clusters of stars called nebulae, or anything else strange on the surface of the sky, was rather trying, and would scarcely fit a modern young lady. In her devotion to her brother, Miss Herschel did not murmur at the inconveniences of these explorations. She was bent on the glory of being a discoverer. To pursue her task to any good effect, she had made herself acquainted with the names and places of the already known stars, comets, and other phenomena. She could detect a new comet in the realms of space, as readily as you would discover a strange passenger in the street. Her brother having put up his twenty-foot telescope, was equally busy sweeping the heavens, and from the size and powers of the instrument, was able to penetrate deeper into space, so as to resolve some of the nebulae into their component stars. In this way, the two together largely increased the catalogue of nebulae, stars, comets, and satellites. For her own part, Caroline first and last discovered as many as eight comets, only two of which had previously been known. The operations were not conducted without danger from accidents, for the apparatus sustaining the larger telescope was far from secure. On one occasion, part of the mechanism gave way, by which Caroline sustained a severe injury in the leg. For six weeks, she was afraid of her poor limb, but by good surgical attendance she fortunately recovered.

During the day, Herschel was busy making telescopes of seven feet, ten feet, and so on, that had been bespoke; some of them being ordered by the king for use by the royal family. One was ordered by the king of Spain at the price of £3150. Two were ordered by the Prince of Canino at a cost of £2300. The making of these telescopes was remunerative work, not to be rejected, but it delayed the preparation of a telescope, with a mirror four feet in diameter, having a focal length of forty feet, on which great expectations were founded. At length, an instrument of these magnificent dimensions was begun at Slough, to which the Herschels removed in 1786. The construction of the forty-foot being beyond the pecuniary means of Herschel, he had two grants from government of two thousand pounds each, with an allowance of two hundred pounds a year for repairs. At the same time the sum of fifty pounds a year was settled on Caroline, as assistant to her brother. In the notes of her Recollections, she mentions that the first quarterly payment of £12, 10s. was the first money she could call her own, and feel at liberty to spend as she liked—a confession marking the simplicity of her character.

At this time Miss Herschel was thirty-six years of age. Though possessing good looks, talents of a high order, and a spirit of industry almost unparalleled, she does not seem to have attracted admirers with a view to matrimony. She, at all events, remained unmarried. If she anticipated that brother William would never take a wife, and that she would never be superseded as his housekeeper, she was mistaken. William married in 1786, about the period of removal to Slough. He made choice of a lady of singular amiability and gentleness of character. She was a widow with a jointure, by which he was able to pursue his scientific career, free from financial anxieties. With a pang of regret, but no reproachful feeling, Caroline relinquished her post at the head of domestic concerns, and meekly went to lodgings in the neighbourhood. Daily, she came to assist in the construction of the great telescope, or to make astronomical notes. She was also useful in relieving her brother from the host of visitors who were disposed to trouble him with questions respecting the satellites of Uranus, or some other of his recent discoveries.

Three years were occupied in the construction of the forty-foot telescope. It was completed in 1789. What a great day for the Herschels was that in which this magnificent instrument was pointed to the sky and ready for taking observations! On the first night after it was finished, Herschel discovered the sixth satellite of Saturn. The powers of this enormous telescope were astonishing. Its speculum or mirror was four feet in diameter, and it magnified about six thousand five hundred times. Though a wonderful product of genius, it has latterly been exceeded in dimensions. The larger of Lord Rosse's telescopes has a focal length of fifty-three feet, with a speculum six feet in diameter; its powers being rather more than double that of Herschel's large instrument. Considering the difficulties he had to contend with, it is surprising that Herschel was ever able to succeed in getting a forty-foot into working order. It was a trying task. For long after its completion there was a continual demand for repairs, and repolishing the speculum, which he executed with his own hands.

Years pass on. Caroline is still busied with her duties, and sometimes almost whole nights are spent on the roof of the observatory sweeping for stars and comets. Her brother had a son, John Frederick William, born to him in 1792, and this little nephew became a new object of interest and affection to Miss Herschel. In 1800, there begins to be a relaxation in her long and assiduous efforts. She took trips to Bath, to London, and to Windsor. She was in correspondence with the most learned men in Europe. Royal personages delighted in conversing with her, and having her at their table. In 1806, she says of a visit to Windsor: 'I dined at the Castle. The Queen and Princess Elizabeth honoured me with kind inquiries after the health of my brother. The Princesses Augusta and Mary also came to see me in Miss Beckdorff's room.' There were occasional illnesses from overwork and bad weather. On a winter evening, in going from her brother's house at Slough, she sprained her ankle, by attempting to walk through the snow in pattens. The effects of the accident were felt for three months afterwards. When William and his family went on a tour to Edinburgh and Glasgow,

Caroline—that ever-faithful being—took charge of the establishment.

Herschel was the marvel of the age. Honours were heaped upon him. One of the universities made him a Doctor of Laws. In 1816, he received the Royal Hanoverian order of Knighthood. As in many cases, the recognition of his extraordinary services in the cause of science was a little too late. His health was broken by the long years of tasking labour, bodily and mental. Yet, when at all able, he persevered in astronomical pursuits. He often complained of giddiness in the head, the truth being that his brain was suffering from exhaustion. He went from Slough to Bath, with a view to relaxation, but both in going and coming his weakness was such that he spent four days on the road. In these illnesses, Caroline remained at Slough to look after matters. She superintended workmen, received visits from princes and princesses, and people of lower degree. Was never a moment idle. The year 1821 opens with the continued declining health of Sir William Herschel, and deep anxieties are felt regarding him. The man was done. His originally strong frame was worn out. Lingered for a little time, he calmly breathed his last on the 22d August 1822. There was mourning in the scientific world. What he did for astronomy is well known. He prodigiously added to our knowledge of the solar system. He, as has been said, discovered Uranus and its six satellites, also two satellites of Saturn. Besides this, he detected the rotation of Saturn's ring, or rather rings, the period of rotation of Saturn itself, and that of Venus, the existence of the motions of the binary stars, and the first revelation of stellar systems besides our own. It might be said, he was the first to give the human mind any conception of the immensity of the universe.

The death of her brother rendered Caroline inconsolable. She had lived for him, toiled for him. The object of her earthly happiness had departed. Only for him had she come to England; and now that he had passed away, she would go home to her own country, endeared by recollections of her father and mother. It is true, that home had undergone some tribulation. The French had for a time been in possession of Hanover, and the old state of things had been considerably upset. Still, there were there some near relations to give her welcome. She was now seventy-two years of age, and needed rest. So, bidding good-bye to her nephew, and receiving from him a sum of money bequeathed by her brother, she went to Hanover to draw out the concluding years of her existence. Yet, it must be understood, Caroline Herschel did not bury herself in this retreat. In fine weather she walked out of doors, and enjoyed the society of old friends. She derived amusement from reading and knitting. The devotional exercises to which she had been accustomed from her youth upwards were not now in old age omitted. In her conversations she spoke modestly and sparingly of her astronomical discoveries, or the labours she had undergone. There were agreeable recollections of her brother, and of the many eminent individuals with whom she had associated in England. She kept up a correspondence with learned men on astronomical subjects; her letters to the very last revealing the breadth of her understanding and kindness of feeling. In 1828, the Royal Society conferred on her

their gold medal for completing the catalogue of nebulae and clusters of stars observed by her brother. She was afterwards chosen an honorary member of the Royal Society. This remarkable and most estimable woman drew out life to an extreme old age, dying in 1848, two years short of a hundred.

It is pleasant to know that she had much epistolary communication with her nephew on friendly and scientific topics. John Frederick Herschel was a worthy successor to his father. His ability as a scholar was marvellous. At Cambridge, he with ease became senior wrangler, and had a choice of fellowships. Emulating his father and his aunt, he addicted himself to astronomical science, in which he happily excelled. By his examination of the heavens with improved mechanical appliances, he largely added to the catalogue of stars and nebulae. Of double stars alone, he discovered as many as between three thousand and four thousand, for which the Royal Society voted him a gold medal. Much of his father's time, as we have seen, was consumed in struggling for a livelihood, and in toilsomely fabricating instruments wherewith to pursue his studies. Young Herschel was spared these tasking exertions. With his fine scholarly acquirements, he was qualified to shine in literature. He wrote essays in the *Edinburgh and Quarterly Reviews*, distinguished by their philosophical acuteness and elegance of language. His *Treatises on Sound* and the *Theory of Light*, were followed by the *Preliminary Discourse on the Study of Natural Philosophy*, one of the most charmingly written books on science in any language. Subsequently, he wrote a *Treatise on Astronomy*, in a similarly popular style. To carry on astronomical investigations in the southern hemisphere, he proceeded to the Cape of Good Hope, and there set up an observatory, at which his labours, extending over four years, from 1834 to 1838, were invaluable to science. On his return to England, honours of various kinds were conferred on him. By Queen Victoria he was created a baronet. In 1850 he was appointed Master of the Mint, but this office he relinquished after a few years, on account of ill health. After a brilliant career of public usefulness, Sir John Herschel died in 1871, leaving a large family of sons and daughters.

Our limited space has enabled us to give but a brief account of the Herschels. We could have wished to present numerous interesting details, requisite to complete a picture of the family history. There has, however, been the less necessity for going into particulars, as we can refer to the admirable *Memoir and Correspondence of Caroline Herschel*, recently published, which we cordially recommend to perusal. The Herschels, as we think, offer a remarkable example of intellectual activity directed to enlightened purposes. Their love of science for its own sake, their entire absence of vulgar ambition or self-seeking, along with their untiring industry, are all something marvellous to read about. Looking to what they individually added to the sum of human knowledge, how insignificant does one feel in comparison! Conscious, as too many of us must be, of having wasted time, wasted means, wasted opportunities to exercise our best faculties, there is a saddening sense of humiliation in considering what, under depressing difficulties, was accomplished by William and Caroline

Herschel. On those who are just starting on the adventurous voyage of life, with its innumerable and specious allurements to idleness, may the illustrious example of the Herschels not be thrown away.

W. C.

FALLEN FORTUNES.

CHAPTER XVIII.—THE ANONYMOUS LETTER.

THE first step of Mrs Dalton, upon reaching home, was to go direct to the library, where she had every reason to expect that her husband would be found. She had entertained but small hope of seeing him on board the yacht; yet, if he had left the house at all, she thought he would have kept his promise—or half-promise—to join the water-party. He was doubtless still engaged with his letters, or, more likely, still thinking his sad thoughts, under pretence of being engaged with them. Her surprise was, therefore, considerable at not finding him; and with her, under her sad circumstances, surprise was at once followed by vague alarm. Her heart beat, not only with haste, as she went rapidly to his own chamber, and then to the smoking-room—to find them both unoccupied. At the door of the latter she had even waited a few seconds, not so much to recover breath, as to expel from her face the apprehensions that she knew had gathered there.

'Why, John, where on earth?'—was the commencement of the half-laughing sentence she had formed, in the expectation of finding him in his favourite lounging-chair with his cigar. But the words faded on her tongue, as she stood pale and trembling in the untenanted room. From the window, she could see the very crag under which—had she but known it—he was lying, unconscious of her tender solicitude. Where on earth, indeed, was he? Or could he be said to be on earth at all?

'John, John!' The very echoes seemed to mock her, and reply 'Gone, gone!' in answer to her tremulous inquiry. She felt that she was growing 'nervous' and needlessly alarmed; and above all things, it was necessary to conceal such feelings. For what—would be the natural demand of all around her—was there to be alarmed about, in her husband's absence from the house? Mrs Campden had already expressed her opinion that he did not like water-parties, and therefore would not put in an appearance on the mere, and she would only recognise a tribute to her own sagacity and knowledge of John's character in the fact that, after concluding his correspondence, he had gone elsewhere. The girls themselves would entertain the same opinion, except that they would not blame him, for they were too fond of him not to be kind—though they were by no means blind—to his foibles.

'I wonder where papa is?' said Kate, meeting her mother in the corridor, on the way to her own room to take off her bonnet and things. 'Marks says he has had no luncheon, but left the house—at least his hat and stick were gone—almost as soon as we did. We must not tell Mrs Campden that.'

'He had a headache, perhaps, and meant to walk it off, and then to return to write his letters.'

'Perhaps so. By-the-bye, there is a letter just

come by the afternoon's post for him, marked *Immediate*!

'Yes,' said Jenny, who had followed her sister slowly up-stairs, but without assistance—it was one of her 'good days'—and I saw Mr Holt take it up and examine it with all the curiosity of a housemaid. I am sure he could not take a greater interest in his affairs if he were papa's partner, and I do hope it has not come to *that* yet.'

'Hush, Jenny, hush!' said Mrs Dalton, in what was for her a tone of severity: 'you may be sorry for such remarks as that when it is too late.'

'My dearest mamma, what *do* you mean?' cried Jenny, all tenderness and terror: her mother's looks alarmed her even more than her tone.

'Nothing, dear, nothing; which I am sure was what you meant. Only, just now, such little things have such an effect on me; and not finding your papa up-stairs, nor in his own room, I—it was very foolish of me—began to think that something must have gone wrong.'

'But, darling mamma,' said Kitty reprovingly, 'what is more likely than that he should have gone for a long walk? Indeed, we know he has, since he went out before luncheon. He told me the other day that he must take more exercise, when I was speaking of his want of appetite, which both Jenny and I have remarked of late.—Have we not, Jenny?'

'Yes, mamma,' said Jenny eagerly; 'and I don't mind telling you now, that I took upon myself to ask Dr Curzon to try and find out if there was anything the matter with him, and if I am not much mistaken, papa has gone to Sanbeck to-day in consequence; in which case, his absence is quite accounted for.'

At this moment there was a sharp ring at the front-door, and Jenny's countenance fell.

'Nay, my darling,' said her mother, mistaking the cause of her sudden despondency, and prompt to administer comfort in her turn; 'let us trust in God's mercy, and hope for the best. There is no reason why a ring at the bell should mean any ill news.'

'It is Dr Curzon,' said Jenny quietly; 'that is all.'

In compensation, as it almost seemed, for her ailment and general delicacy, this young invalid's senses were unusually acute. Her eyes had a wider range, her ears a keener perception, than those of her more robust fellow-creatures; every familiar step and voice, especially if they to whom they appertained were dear to her, had an individuality for her, and even their way of scraping their shoes or ringing the bell. She was right in this case, for in a few moments her maid came up to say that the doctor was awaiting her as usual in the library.

'I dare say you are surprised to see me so soon, my dear,' he began volubly; and if her mind had not been so far occupied, she would have detected in his address the manner of a set speech; 'but as I happened to be passing by the gate, I thought I would, for once, pay my respects to your mother. It is quite an unprofessional visit, I assure you; only Marks marched me in here, as usual, and I had not the strength of mind to resist him; his patronage and condescension always overpower me.'

'I don't care what was the reason that brings you here, doctor,' answered Jenny, 'but I never

was more glad to see you. Dear mamma, who, as I have told you, has been exceedingly nervous of late—quite unlike herself, I think—and all, no doubt, upon papa's account, is just now in the most unhappy and agitated state, just because he has left the house for a few hours, while we were in the yacht upon the lake. I endeavoured to quiet her by confessing that I had expressed some fears to you about papa's health, and that it was very likely you had persuaded him to visit you professionally at your own house. But now it seems that is not the case, I scarcely know what to say to comfort her. Of course it is very unreasonable in her to be alarmed about nothing in this way, but we girls scarcely know what to say.'

'That must be a very unusual circumstance,' said the doctor, but without the smile that usually accompanied his good-natured raillery. 'Well, of course your dear mother is unreasonable; that is only natural under the circumstances. Our object must be, of course, to find out some simple explanation of his absence till he turns up again. How long has he been away altogether, do you suppose?'

'Since half-past eleven, I should say, if not earlier. Can't you say that you have recommended him to take more exertion? I have heard you often rally him about his stopping indoors.'

'You are sure he has not returned home since the morning, and then gone out again?' inquired the doctor earnestly.

'So the servants say; and he is not in the house, for mamma has looked everywhere for him. How grave you look, doctor. You don't know anything, I trust, that goes in any way to corroborate dear mamma's apprehensions?'

'Pooh, nonsense, no. But it is no use attempting to convince her—or any of your sex, miss—by mere argument. When I bring your papa home with me, however, then I suppose she will believe that it is all right.'

'Oh, dear doctor, if you only *could*. Do you really know where he is?'—for the doctor had risen, with the obvious intention of setting out at once.

'Well, I can't say I know, Miss Jenny; but I think I can make a shrewd guess. You can keep a secret, my dear? I have often said I could back you against any girl in England for a secret—though *that* indeed is no very great proof of confidence.'

'If it is for mamma's sake or papa's, I would die rather than tell it,' said Jenny confidently; the doctor's manner had worked upon her impressionable nature more deeply than he had intended.

'Oh, it's not so serious as all that,' answered he gaily; 'but you know how your papa hates any fuss being made about him; and the fact is, he did make a sort of half-promise to come over into Sanbeck and consult me to-day professionally. And he has done this, no doubt; but somehow we have missed one another. Now, if I leave my pony here and go across the crags, I am sure to fall in with him. Perhaps, indeed, he is waiting at my house at this very moment.'

'Oh, thank you; that will be an excellent plan, doctor. But it will cut up your whole afternoon. Why should we not send messengers?'

'Because your father would not like it. It is essential that no one should know of his intention to consult me. If I don't put in an appearance

here before nightfall, or if your papa and I miss one another by any chance, and he returns without me, you will see that they send my pony home.'

'Yes, yes. But you really think that you will find papa?'

'I do, child, upon my honour.'

'Then give me a kiss, doctor. Do you know there was something—I don't know what—in your manner, that made me almost as nervous as mamma? But I am sure you would not deceive your poor Jenny.'

'I believe you have more confidence in your own sagacity than in my ingenuousness,' was the doctor's laughing reply. 'Now, let me out at the window here, and then I can sneak down to the boat-house, and row myself across without attracting observation.'

'Stop a moment, doctor. If you are really pretty sure to meet papa, a letter has come for him marked *Immediate*, and you had better take it: I will fetch it from the hall.'

'Very good, Miss Jenny,' and having placed the letter in his breast-pocket—and once again enjoined her as to sending home the pony the doctor let himself out by way of the window, and made his way through the shrubbery to the boat-house. It was not uncommon for him, when on foot, to come or return from Sanbeck by way of the river; and one of the boatmen who were about the place at once offered to 'put him across.' But the doctor replied that he himself intended to return; and seating himself in the safest-looking of the small craft for the configuration of his form was unsuitable for one of narrow dimensions—he ferried it across, with no inconsiderable skill. Arrived on the other side, he suffered the stream to carry him down below the usual landing-place, to a projection in the bank, behind which, and concealed from the observation of those opposite, he found a boat already moored.

'I thought so,' murmured he, with a sagacious nod, as he fastened his own wherry beside it; 'he has not returned. The foolish fellow was in greater haste to slip his cable than I had given him credit for.'

Then the doctor began to ascend the crags; not only with deliberation, as it was his wont to do, but pausing at every few feet, to look to left and right, as though in search of some particular object: at the summit he made a still longer pause, gazing earnestly about him in all directions. The scene was still extensive, though the shades of the autumn evening were coming on apace, yet he saw not what he sought, and his face, which had been hitherto serene, and even cheerful—the face of a man who is well satisfied with his own sagacity—began to lose its confidence. He was convinced that his examination of the ground behind him had been complete; the long range of crags were now open to his view on both sides, and in front lay the winding path up which Dalton must needs have come from Sanbeck on his way homeward. His eyes could even sweep the road in the valley almost to the very spot where his own house stood, and where he had bidden his guest adieu that morning.

'He cannot surely have gone on to the lake,' muttered the doctor, in a tone, however, that had more of apprehension in it than of assurance; 'or why should he have come to me?' The day was

warm, and his exertions had been considerable; but as he took out his handkerchief and wiped his forehead, you might have seen by the expression of his countenance that the action was caused by mental rather than physical causes; it was a signification of supreme anxiety and alarm. 'My tongue cleaves to the roof of my mouth,' he murmured; 'there should be a spring about here somewhere.' Having cast about him for its bearings, he walked quickly towards a high conical hill to southward, and at its foot, upon the side remote from that where he had been standing, found the spring—and a man's body stretched beside it. 'Ah!' exclaimed he, aloud, with a great sigh of relief: 'you were right, Tommy, after all.'

This was not in approval of the spectacle before him (though it by no means shocked him, as it would have shocked any one else), and far less of the action that had brought the prostrate man to such a pass, but merely in acknowledgment of his own foresightedness, and perhaps in reparation for having temporarily doubted it; for the doctor's baptismal name was Thomas. Then he knelt down beside the body of his friend—for it was no other than that of Dalton—and proceeded to make a close examination thereof. It lay huddled up, as though it had fallen, or rather sunk down from a sitting posture into a recumbent one, yet by no means stiffly, like a corpse. Close beside it, as though it had dropped from his lips, was a half-smoked cigar. The face was pale, but placid; one hand was hidden in the breast, and when the doctor drew it, unresisting, forth, it was seen to clasp a locket. It opened to the touch, and shewed a lock of hair within it brighter than the gold in which it was set. 'His wife's hair, no doubt, poor fellow,' mused the doctor, who, having completed his professional examination, apparently to his satisfaction, proceeded with great coolness to take stock of the 'personality'—including the contents of his friend's pockets.

'Her tresses will never look like that again, yet they shall not grow white before their time, if I can help it. What a mad fool was this, and yet what method in his madness. He washed his mouth out with this, did he?—here he pulled forth Dalton's sherry flask—and then smoked a cigar, to make all sure! Upon my life, he was a cool one.' In each of the breast-pockets was a phial done up in paper, which the doctor's own deft fingers had wrapt around it a few hours ago; both were still full, and with their corks plugged tightly in. The searcher shook his head, as he held one of them up to the waning light. 'What a fox he was,' soliloquised he; 'and yet not so wary as the trapper. This is thinner and lighter than when it left my surgery this afternoon; it has had water put to it; and much water. If it had been the liquor for which you took it, my unhappy friend, your haste to get out of the world would have defeated its own object. You would never have kept such a dose as that upon your stomach. It is well that I am not one to put things off till to-morrow, else, having awakened from this stupor, and finding yourself left alone upon the desolate fells here, there is no knowing what rash act you might not have committed, from which no science could have saved you. Even now, there is much to be done, I fear, before this maggot is got out of your head. If I had but one morsel of good news for you, however small, it would be like bread to a

starving man. I wonder what this letter contains which I have been charged to give you, and that looks so important with its *Immediate* scrawled across it. Its good or ill tidings may turn the scale of life or death. When one has rifled a dead man's pockets, to open his letters should be easy. Yet it's a scurvy thing to do.' The doctor sat irresolute, with the letter held doubtfully in his hand, as though he was weighing it for the post. 'It is curious,' soliloquised he, 'how scrupulous one is about doing a little harm that good may come of it, which I suppose old Jefferson would set down to our Protestant bringing-up. One may say or do anything, it has been laid down by a high authority, only short of that of the church, to save the reputation of a woman, and yet I am in doubt as to doing this, though its object be to save life—the precious life, which it is my mission and calling to preserve. And not only this man's life, but that of his wife also; for if he dies, *she* dies; if not to-day, yet a few months hence, when her hour of trial shall have come; and then those sweet girls will be orphaned.

'Unhappy wretch!' cried he, addressing himself to his unconscious companion, 'by what strained and violent arguments did you persuade yourself to leave her thus? Compelled by what despair? Yours must have been a woful case indeed.' As if touched by the thought of so much misery, the doctor bent down over the shut face of the prostrate man, and regarded it with tender solicitude. 'I will do it,' murmured he, 'for his wife's sake.' Then once more he examined the letter. 'It is no woman's writing,' he mused; 'there will be no secret of that sort to carry with me to my grave, making one distrustful of man's virtue even though he be placed in heaven itself. It is a clerical hand, though marred with haste. Some news of scrip and share, no doubt: something has gone up to zenith, or more likely, to judge by my own experience, down to zero. Well, here goes.' He drew out his penknife, and prised open the envelope with professional neatness, muttering something at the same time about 'healing by the first intention.'

'There! Sir James Graham himself could not have managed it more cleverly.' The envelope contained a half-sheet of folded paper, on which was written but this single line—

'Stick to the Larv. Verbum Sap.'

MEAT AND DRINK.

In the article of diet, nature prescribes nothing dainty or pampering. One may live well on very simple kinds of animal and vegetable food. To the young, high seasoning and all sorts of stimulants are in one way or other damaging to the constitution. Unfortunately, what with jaded appetites, the follies of fashion, and the selfishness of dealers, as well as neglect of the laws of health, there is a very general consumption of what is deleterious and objectionable.

It is scarcely too much to say that in the present high-pressure system, one can scarcely in town or country get so much as a drink of pure water. That most blessed element, the gift of Heaven, is one way and another basely polluted. On all hands, rivers are so contaminated with sewage, or the foul drainage of manufactories, that fish

cannot live in them. Happy is the man who lives near a pure spring, and is not compelled to swallow a solution of matters the most fetid and deleterious. In these days, alarming doubts are entertained of the ancient village pump. The water brought up is, alike from smell and a certain peculiar sparkle, shrewdly guessed to partake of too close an alliance with adjoining drains and gutters. You hear of people dying from the effects of bad water and bad milk—one thing said of the milk being that the cans that brought it to your door had been washed in water loaded with impurities. We do not even feel safe in putting milk in our tea. The world is in a sort of conspiracy to poison us and send us to our long-home. Happy nineteenth century, with its prodigious scientific improvements! Water tainted, milk tainted, what is to be done? There is some comfort in knowing that the stories told of beer being doctored with *Cocculus Indicus* have been lately, on investigation, proved to be fabulous. Beer of the more simple kind, brewed from malt and hops, for the present escapes suspicion.

Talking of tea, of which in a moderate way we have always been fond, very shocking scandals have latterly been circulated. It has been absolutely asserted that in many cases tea is not tea, but something furnished up to look and taste like tea; the prices charged for it being little better than picking the pocket. To make sure, as you imagine, against imposture, you go the length of buying a chest. There it stands, a very honest-looking chest, studded over with Chinese characters, and you are almost certain that it has not been tampered with. Quite true. The chest is just as it came from China. But there are wheels within wheels. This honest-looking chest is a sham. It was packed with rubbish in China; for the Chinese are as dexterous in cheating and the art of turning the penny as anybody on the face of the earth. To their adulterated compounds they candidly give the name of *Lie* tea. We learn on good authority that this article, which is in all respects a lie, is an ingenious composition of the dust of tea-leaves, foreign leaves, sand, quartz, and magnetic oxide of iron! all skillfully united by a solution of starch into little masses of various forms and sizes, in imitation of different kinds of tea. Here we are called on to use the new verb 'to face.' To make rubbish look like tea of some particular kind, it is faced, or disguised in some kind of appropriate coating. Those teas, for example, which are meant to imitate Caper or Shulan are coated with plumbago or black-lead; and if gunpowder, with Prussian blue, turmeric, china-clay, and other white mineral powders! So clever are the Chinese in manufacturing this *lie* tea, that it requires skill and practice to detect it. These iniquitous adulterations are chiefly, if not altogether, found in low-priced and much broken tea, or in the lower qualities of black and green gunpowder. What was thought to be adulteration by iron filings is found to be the magnetic oxide of iron derived from the soil, which finds its way into the tea from the dust on the leaves. The amusing reason the Chinese give for dyeing their tea is: 'That as foreigners seem to prefer having a mixture of Prussian blue and gypsum with their tea, to make it look uniform and pretty—these being the articles used for that purpose—and as these ingredients

are very cheap, they have no objection to supply them, especially as such teas always fetch a higher price! They, however, take good care never to dye or face any tea they drink themselves.

Sugar is a subject that cannot be overlooked, since Dr Hassall, in his recent work on *Food and its Adulterations*, gives it as his opinion 'that the impurities of raw sugar prevail to such an extent, and are of such a nature—consisting of animalcules, spores of fungus, grit, woody-fibre, &c.—that he is forced reluctantly to the conclusion, that the brown sugars of commerce are in general in a state unfit for human consumption.' The animalcules referred to produce 'grocers' itch' among those who are much engaged in 'handling' sugars, and are of the same genus as the itch insect, only more formidable in their organisation. No less than one hundred thousand of these minute creatures are to be found in one pound of raw sugar! In sugar confectionery, the chief danger lies in the colouring substances and flavouring essences with which they are made up. The flavouring essences used in pine-apple and jargonelle-pear drops are prepared by distilling a mixture of certain acids and alcohols having the odour of the pear and pine with the oil of vitriol! 'A very fruity and fragrant essence may be produced from rotten cheese by treatment with sulphuric acid and bichromate of potash!' A caution to mothers and those who have the charge of little ones ought this to be, surely. No wonder that doctors inveigh against the habit of giving children lollipops indiscriminately.

In stale bread, certain fungi are developed, of which an interesting account is given with illustrations as they appear when seen through the microscope, where they resemble young plants of various forms and sizes. There is a poisonous grass called *darnel*, the seeds of which get mixed with wheat-flour sometimes, and produce all kinds of maladies. In a prison at Cologne, sixty persons suffered from the use of a bread-meal containing a drachm and a half of darnel in six ounces of meal. Flour is very much adulterated with an article called *cones* flour, composed of wheat, rice, and bean flour, and extensively used by the bakers. The public are warned not to judge of the quality of bread by its whiteness, as the whitest breads are the most adulterated, chiefly with alum, the use of which in bread is injurious, and occasions acidity and dyspepsia. But the delinquents in this case are not so much the bakers as the millers, who introduce the alum into the flour, most of the respectable bakers having discontinued the use of alum in their bread. One very serious matter regarding the bread offered to the public is its general deficiency of weight. A loaf ought to weigh three pounds, but thirty-one and a half loaves obtained from thirteen different bakers were in the gross eighty-six ounces short of the proper weight. Scarcely a single loaf was full measure. It is, however, but fair to explain, that in England the poor people have their bread weighed in the scales at the time of purchasing; and it is no uncommon thing to see the extra bit which goes to make up the full measure telling its own tale.

A great quantity of London milk is supplied by cows that are kept in various confined and unhealthy places in the metropolis. As such cows are seldom turned out to grass, and are fed on artificial and unnatural food, such as brewers' grains

and distillers' wash, they are stimulated unnaturally into producing large quantities of inferior milk, and even become worn out and diseased in consequence. Gastric irritations are often produced by drinking what is called 'blue milk,' as this blue colour is derived from nothing less than fungus. It is a mistaken notion to suppose that the creamometer is an infallible test of milk, as some genuine milks are deficient in butter, while possessing a full proportion of cheese and sugar; tested by the creamometer, such milks would naturally fall short of the average percentage of cream. Milk adulterated with sheep's brains needs the test of the microscope, when the nerve globules of the brains are easily distinguishable, being altogether larger and longer than the milk globules.

Those who use salt butter on economical grounds may be surprised to learn that in the long-run it is dearer than fresh butter, owing to its being so adulterated with water and salt. But why talk of fresh butter. In London, as far as we have ever seen, there is no such thing as really sweet or fresh butter. All the butter, even of the best sorts, is slightly salted, for the purpose possibly of making it keep, or of disguising it in some way or other. The truth, however, is that a vast quantity of the article exhibited in shops as butter is not butter at all—has not a particle of true butter in it, but is what is popularly known as butterine, being a composition of certain animal fats, which is palmed off on the customer. And so ingeniously is the article prepared, that it is a difficult matter to detect the imposture. Cheese is comparatively free from adulteration; but it has its own evils to contend against, in the form of fungi, animalcules, and insects, the flavour of which unwholesome ingredients is, to many, not distasteful. Cheese-mites are very tenacious of life, and a story is told of 'one which lived for eleven weeks gunned on its back to the point of a needle, without food!' The spread of decay in cheese can be prevented by exposure to strong heat, or by plunging the cheese into some liquid, which will destroy the larvæ, without communicating any disagreeable flavour.

The highly coloured green bottled fruits and tinned vegetables are nearly all contaminated with copper to a greater or lesser extent: it is purposely introduced, not as necessary to the preservation of the fruit and vegetables, but to retain the bright-green colour considered so essential to the look of the articles. The English purveyor, like the Chinese, finds that the best-looking things, coloured at the expense of a little poison, demand the readiest attention and the quickest sale! A notable example is given of this perversity of choice in the case of the red sauces, such as anchovy sauce, all of which are coloured with *bole armenian*, a ferruginous earth containing a large quantity of the red oxide of iron; or an article made in imitation of it, consisting of Venetian red and chalk. These substances are not added to enhance the colour only of the sauces, but very often to cover other adulterations and unclean matter; as in the case of anchovy sauce, which is most unsightly until the *bole* is added, owing to the quantity of dirt and refuse matter contained in the fish from which it is prepared. Messrs Cross and Blackwell found that the impurities were incredible, and that their withdrawal added greatly to

the improvement of the flavour; but notwithstanding their willingness to offer a clean article to the public, they found that the highly coloured red sauces were still preferred to the pure and uncoloured, *on account of their redness*.

The public—especially the poorer classes—are cautioned against buying jams labelled 'Family Preserve,' 'Royal Jam,' 'Fruit Preserve,' or 'Household Jam,' which are made up chiefly of rotten, muggoty, and unsaleable figs, together with bad plums and the sweepings of warehouses. Green-gage jam is frequently coloured with copper, and marmalade is often adulterated with apples and turnips. Copper enters largely into much of our most tempting preserves, owing to the copper vessels in which they are prepared. Even the sparkling boubons that look so inviting in the shop-windows at Christmas-time are all more or less impregnated with it, and it finds its way into our Christmas pudding in the citron-peel. House-keepers are therefore warned to be cautious in their use of copper saucepans for preserving—preference being given to the metallic lined; but where copper is used, the utmost care is needed in keeping it as bright and clean as possible; and the jam should not be allowed to remain in contact with the vessel a moment longer than is absolutely necessary. In Scotland, preserve-pans are almost invariably made of brass.

Coffee and cocoa enter so largely into the consumption of daily life, that the purer we can drink them the better. The strength and nourishing properties of coffee are considerably deteriorated by adulteration with chicory, and as one is the seed, the other the root of different plants, they bear not the least analogy to each other. The introduction of chicory without notification, into coffee, is a glaring adulteration, that ought to be protested against. A ready mode of detecting its presence in coffee is, if the ground coffee cakes in the paper in which it is folded, or when pressed between the fingers. Cocoa is adulterated with an alarming catalogue of substances; and in the bulk of manufactured cocoa supplied to the British public, Dr Hassall tells us that there is less than one-fourth of the cocoa-bean, the remaining three-fourths being supplied by starch and sugar, which render the compound thick, heavy, and indigestible. Unless boiled, starch is indigestible; and when it is mixed with cocoa in large quantities, and made according to the usual directions, which are simply to pour boiling-water on the cocoa, the starch globules, which need boiling, remain undissolved. When the colour of cocoa has been reduced by adulteration with large quantities of starch and sugar, Venetian red and other ferruginous earths are sometimes employed to restore the colour; and as these are contaminated with arsenic, the public are cautioned against the so-called 'pure' cocoas so freely offered, and largely consumed; but it may be presumed that the public have grown to regard these adulterations with a leniency akin to that of the old lady who observed, when cautioned against drinking green tea: 'It takes a long while to kill!'

Many people like pork. As we are not Jews, we do not say anything against an indulgence in this article of diet. Only be sure you get the right thing. Pigs are foul feeders. We remember of long ago living near a place where dead horses were boiled down for pig-meat. And no doubt

it was this carnivorous appetite that put swine beyond the category of a wholesome Hebrew diet. Yet pigs may be maligned. They are carnivorous when they cannot get food of a more simple kind, but they are not naturally dirty in their habits. Leave them alone to clean themselves by wallowing in the mire, and give them clean straw for bedding, and you will find that they really are not the foul creatures generally supposed. What ruins their character is the greed of their proprietors, in stuffing them with wretched food, and keeping them dirty. From these circumstances arises pollution of flesh. The pork is diseased, and diseased in the worst form, by the presence of parasitic animals, known as trichinae. These trichinae, or worm-like creatures, are a sore torment to the living pig; and when he is killed, and becomes pork, the parasites that preyed on his vitals may, when eaten, play considerable havoc in the human system. The safeguard consists in never eating imperfectly cooked pork. Cooking, and especially smoking, renders pork innocuous, the increased temperature destroying the trichinae entirely. Poisoning may occur from eating decomposed sausages or pork-pies, as the flesh of the pig, though not diseased, often produces choleraic symptoms, created by a poisonous fungus generated by decomposition.

Enough having been said of pork, we come to fish, which, strange to say, in a putrid condition, may be eaten with impunity; but the flesh of over-driven and tortured cattle often contains a poison which produces eruption of the skin in those who handle it, and considerable injury to those who eat it. Animals which have had inflammatory diseases, such as pneumonia, and have been killed, are commonly eaten without ill effects, provided the inflammation has not progressed to a serious stage. Carbuncles are produced very frequently by eating the flesh of animals which die of pleuro-pneumonia, as the virus is not destroyed by boiling or roasting; and it is a remarkable circumstance noticed by Dr Lethely, that, ever since the importation of this disease from Holland in 1842, the annual number of deaths from carbuncles, phlegmon, and boils has been gradually increasing.

We could say a great deal more on the subject, drawn from the suggestions in the work of Dr Hassall, but enough has been said to induce a desire in our readers to study the book for themselves.

NUMBER 25 IN OUR SQUARE

Is a large brick house, with five windows to the front, and a long balcony, full of mignonette and geraniums throughout the summer. For a long time, nothing was known of its inhabitants beyond the information contained in the *Directory*, where they were registered as Miss Keith and Miss Indiana Keith. Indeed, for ten years, Our Square was kept in total ignorance of their history. By sight, we all knew them well, for frequently, if the weather was fair, they were to be seen walking in the Square garden, and were generally accompanied by a dark-complexioned but pretty little girl, and a Hindu, who, though dressed like an Englishwoman, was supposed to be an ayah. The little

Leila, who must have been about three or four years old when they first came to Number 25, never joined in the games of the other children in the Square, but used to walk with the ladies and the ayah, chattering away in a tongue which the wondering nurses supposed to be Hindustani, and which seemed much more familiar to her than English.

At church, the Misses Keith were most regular; and generally, on a Sunday morning, Leila accompanied them, with the ayah, who seemed to follow her like a shadow. In all parochial charity lists their names appeared, and the clergyman was inclined to ascribe many an anonymous donation to their liberality; and often, on a week-day afternoon, their carriage, instead of taking the direction of the Park, would convey them to the workhouse or hospital, where they were ever most welcome.

Of their personal appearance we have hitherto said nothing. Miss Keith, who might have been about thirty when she came to live in Our Square, was small and insignificant-looking; but her expression was mild and agreeable, and the tone of her voice pleasant. Miss Indiana, who must have been nearly ten years younger than her sister, was tall and slight, and her features were delicate and beautiful; but her whole air and manner was that of a person who has passed through a great sorrow; and the sallowness of her complexion rather marred her general effect. Her voice, more musical than her sister's, was mournful in its tone, expressive of a sort of quiet weariness, and very different from Anne's cheerful, rapid accents; and yet, dissimilar as they were, the closest affection united the two. And now, instead of letting our readers grope, as we did, in the dark, we will, without further preamble, admit them into the secret of Number 25, and tell them the story as it was told to us, nearly twenty years ago.

Anne and Indiana Keith were the only children of Sir William Keith, who occupied a high judicial appointment at Agra, and had spent the greater part of his life in India. Soon after the birth of Indiana, Lady Keith was ordered to return to England, for the sake of her health, and her two children went with her; and when, in a couple of years, she died, they remained there, with their grandmother, till her death deprived them of their home, and they went out to join their father in India. At that time Indiana was seventeen years of age, and her beauty struck and delighted all the English residents of the city. Her rich colouring was a positive feast to the eye, after the sallow cheeks of the Agra ladies, and only enhanced the lustre of her glorious dark eyes; so that in a very short time the whole garrison was at her feet, and all the civil servants were hopelessly in love. The elder sister was completely thrown in the shade, and she knew it; but she was quite free from any feeling of jealousy, and delighted in the universal admiration that Indiana inspired. Of course, among her worshippers there was one that the beauty preferred; and though the spirit of coquetry which possessed her rendered her sentiments doubtful for a time, she submitted at last to become the betrothed of Captain Henry Willoughby, of Her Majesty's 131st Regiment of Foot, a gallant officer and excellent man, who was a universal favourite, and especially approved of by Sir William. It is true his means were small,

but then the lady's fortune would amply suffice for both; and as there was no particular reason for delay, Indiana consented to the day being fixed for the marriage.

One morning, as she and her sister were occupied in looking over a number of trousseau dresses, just arrived from Calcutta, she was told that a person wished to speak with her; and two native women entered the room, the first thickly veiled, the other with her face uncovered, and carrying a baby of about a year old. To Indiana's rather hasty inquiry of what they wanted, the foremost answered by removing her veil, and displaying features, which though dark, were strikingly handsome; and then, approaching the white beauty, timidly asked, in broken English, if it was true that the Bebee was going to marry the Soubahdar Willoughby.

Indiana nodded assent, with a smile and a blush, and Meenah Bae continued: 'Does the English law allow men to have two wives?'

'Good heavens!' exclaimed Indiana angrily, 'what does all this nonsense mean?' while her calmer sister answered: 'Englishmen can never take a second wife till the first is dead.'

'Then the Bebee mustn't marry the Soubahdar Sahib;' and she handed to the sisters a piece of paper, which Indiana took and opened, and perused with an angry frown, though, as she finished it, she laughed, and said: 'This is some stupid joke, meant to frighten me. Somebody has been making a fool of you, I fear.' Then turning to her sister: 'Look, Anne; a contract of marriage between Henry Willoughby, Captain in Her Majesty's 131st Foot, and Meenah Bae, daughter of Holkar's Dewan, with some unreadable name or other; dated two years ago, at Indore.—Do you mean to say, and she turned fiercely to the woman, 'that you consider yourself married to Captain Willoughby?'

Meenah Bae answered timidly in the affirmative. A thick cloud rested on Indiana's brow as she again examined the document.

'It is his signature,' she said, with choking voice. 'Here is a note I had from him yesterday; it is undoubtedly his writing, signed by a clergyman too, the Rev. W. Jones.'

'There is Henry coming!' exclaimed Anne, who was looking out of the window.

'We will have him in here,' said Indiana coldly, and gave orders to a servant.—'You, Meenah Bae, remain veiled till I bid you shew yourself.'

Captain Willoughby entered the room with a look of deep depression on his face, which at any other time would have roused Indiana's tenderest sympathy; but now, without observing it, she bowed in a manner that at once startled and confounded him, and before he could approach her, said: 'Captain Willoughby, you are come at a moment when your testimony is wanted. Have you ever seen that person before?'

At her signal, Meenah Bae raised her veil, and Willoughby started slightly, as he beheld the beautiful face, and answered rather vehemently, for he fancied that Indiana was jealous: 'Never that I can remember.'

'Would it be inconvenient to you to exert your memory a little?' demanded Indiana in the same cold, hard voice; while Meenah Bae, exclaiming, 'It is he! it is my husband!' threw herself at

his feet, embraced his knees, and kissed the hem of his garment in her rapture.

Poor Captain Willoughby, thoroughly bewildered by this ebullition of tenderness on the part of a perfect stranger, and by his betrothal's sudden change of manner, and also oppressed by the sad news that he had come to communicate, could not speak for a while, and his silence confirmed Indiana in her suspicions of his guilt. At length he replied: 'I cannot recollect having ever seen her before, and what she has to do with you and me, on my honour, I cannot conceive.'

'Your conscience should tell you,' said Indiana. 'So you persist in disavowing her!'

But Henry Willoughby's patience could last no longer, and without noticing the last question, he exclaimed: 'What all this means, Indiana, you best know; but I confess it appears to me a very dull jest, especially under the present circumstances. I have sorrow enough already without your adding to it. You, from whom I hoped for comfort!' he added with emotion. After a moment he recovered himself, and went on: 'My regiment is just ordered to march, at a moment's notice, against the Sikhs, and we start this evening.'

Indiana's cheek grew pale, but otherwise she gave no sign of emotion, as she handed him the paper, and said: 'It may appear a jest to you, but it certainly is none to me. Read that.'

Willoughby read it as desired, and then said: 'I never signed this paper. It is true I was at Indore about the time when this marriage is said to have taken place; but surely, Indiana, you cannot believe such a story about me.—O Anne! she cannot really believe it!'

Miss Keith shook her head sorrowfully, but did not speak; and Indiana, without looking at him, said: 'Meenah Bacc, can you swear to this man as your husband?' and the woman unhesitatingly answered 'Yes.'

On being further questioned by Anne, she related that her husband had been obliged to leave Indore a few days after the marriage, but that she had lived on there till the birth of her child, when her father, in ignorance of it all, and of her change of faith, was anxious to give her in marriage to one of her own nation; and to escape his importunity, she had fled to Agra, and whilst making inquiries respecting her husband, she had seen him on parade, and hearing that he was about to be married, had come forward to assert her own claims.

In answer to all this, Captain Willoughby could give nothing but an emphatic denial; but he owned that appearances were against him; and Sir William, whom Anne had summoned to the conference, looked disturbed, and said that it was just as well that Willoughby should have to leave Agra now, before the story got abroad. He would cause the affair to be thoroughly sifted, and the witnesses sought out whose names were appended to the document, and for the present, anyhow, the engagement had better be considered as at an end.

Captain Willoughby, whose pride was deeply wounded at his word being doubted, acquiesced, and approached Indiana to bid her farewell; but his offered hand was rejected; and haughtily bowing, she turned away; and when that evening the 131st left Agra, in high spirits at the prospect of an encounter with the Sikhs, perhaps the saddest heart among them was that of Henry Willoughby, whose only hope now was that he might fall in

battle, and that Indiana might then repent her injustice. But he was disappointed, and passed through all the battles of Moodkee, Ferozeshah, and Soobraon, without a scratch; and though risking his life on every occasion in the most reckless and daring manner, and performing feats of the most heroic bravery, failed in finding the death that he desired.

After Willoughby left her father's house, Indiana still preserved the same stolid composure; her pride was deeply hurt at the indignity that had been offered her, and yet, with strange inconsistency, she insisted on Meenah Bacc's taking up her abode in the house, and shewed the greatest kindness towards her and her child.

Perplexed by her sister's conduct, Anne Keith knew not what to do, or how to rouse her from her unnatural calmness; but this was suddenly ended, for as the troops left Agra, they had to pass by Sir William's house, and at the sound of the drums and fifes, Indiana fainted away, and it was some hours before she recovered her senses. A long illness ensued, and left her so weak, that the doctors assured Sir William that his only chance of saving his child's life was to send her back to England; and as his own health was giving way, he decided on resigning his appointment, and returning with her.

He had not forgotten his promise to Willoughby, and every inquiry was made, but in vain. The Rev. Mr Jones had been dead for a year and more; the Dewan, though he had discovered that his daughter had married an Englishman, was either unable or unwilling to give further information; and the two native witnesses whose names were appended had left their country during some troubles, and could not be traced; and even Anne Keith's faith in Willoughby was beginning to give way, though she still clung to the belief that some fatal mistake had occurred.

Indiana's long illness had destroyed the freshness of her beauty, but she still possessed sufficient charms to attract numerous admirers, and one of the most pertinacious was a Mr Spurgeon, who had been long devoted to her, and who, on Willoughby's departure, and, it was reported, dismissal, again took the field, though with no more success than before.

Sir William had stayed too long in India, and after leading an invalid life for a year at Bath and Tunbridge Wells, he died, leaving a fortune to his two daughters, who thereupon established themselves in Our Square, and led the useful and secluded life that we have described. Meenah Bacc, who, though she had been baptised, was still known by her former name, and the little Leila, accompanied them; and the child was the object of the warmest affection of both sisters, and more especially of Indiana, whose resentment had long since been extinguished by Anne's kind and Christian counsels, and who now felt only pity for the unfortunate Willoughby, with an occasional feeling of pride when she saw his name mentioned with praise in the despatches, and of regret at the thought that such brilliant qualities should be united with so much baseness.

One day, ten years after the Misses Keiths' establishment in Our Square, Anne was confined to the house with a cold, and Indiana went alone to the hospital where they were accustomed to pay

weekly visits. In one of the wards she missed a familiar face, and in answer to her inquiries, was told that the poor sufferer had died only the day after her last visit. 'He talked a great deal about your kindness to him, ma'am,' said the nurse, 'and was very quiet and gentle to the last. But the patient who has his bed now is very troublesome. He was brought in nearly a week ago, having been run over by a cab, and was hurt so badly, that the surgeon doesn't think he'll get over it; and I am afraid, ma'am, that he isn't in a right frame of mind, for he used dreadfully bad language, when they brought him in, though lately he has been quieter.'

When Indiana had gone the round of the ward, with a few kind words to each patient, and the reading aloud of a psalm and a prayer to such as could bear it, she approached the bed of the man of whom the nurse had spoken, and though rather in dread of what he might say to her, sat down by him, and gently expressing her sympathy in his misfortune, asked if she should read to him. The man, whose eyes had followed her with interest, ever since she came in, assented with a readiness and civility that surprised the nurse; and as she read on in her sweet low voice, his groans and restless movements gradually ceased, and he gazed on her still beautiful face with an expression from which all ill-humour and suffering had vanished. When she finished one psalm, he begged for another; and when at last she prepared to go, he said: 'Did I not hear them call you Miss Keith?'

'My name is Keith,' she wonderingly replied.

'Can it be that you are the Indiana Keith whom I knew at Agra some ten years ago? You have her voice and her features; but you are somewhat changed, though not so much as I am.'

'Yes, I am Indiana Keith, and was living at Agra ten years ago; but who are you? I seem now to remember your face, but not your name.'

'Have you quite forgotten Fleetwood Spurgeon, who was one of the many you made fools of?'

He spoke with an accent of bitterness, and Indiana felt it, and coloured as she answered: 'I remember you now; but you are very much changed. How came you in this place?'

'When you left Agra, I didn't care what became of me, and soon got into trouble, and had to leave the place; and then I went to Calcutta, and so on to Australia, where, after some time, I got some gold. But I soon lost the greater part by gambling; and so, tired of knocking about the world, I came back to the old country, and a warm reception she has given me. The very day I landed, I met with this accident; and unless the pain in my side gets better, I don't suppose I shall ever go out from here.'

His reckless tone distressed Indiana, and she began to urge on him the necessity of seeing a clergyman, and preparing for his end; but he interrupted her by saying: 'A parson would do me little good; but there is one thing which I must confess before I die, and to you only, for it principally concerns yourself. You remember Willoughby of the 131st?' Indiana's blush answered, for she remained silent, and Spurgeon proceeded: 'You probably thought that the cause of your quarrel was known only to yourselves—I mean his previous marriage with Meenah Bace—but I knew it all, for it was a plot of my own devising. I was mad with jealousy at Wil-

loughby's success, and was meditating in what way I could injure him, when my evil genius threw in my way Meenah Bace, who had come to Agra in search of her husband, who was captain in the 131st Native Infantry, but, as I well knew, had been missing for a year or more, ever since some skirmish or other. His name, Henry Millingsby, so capable of transformation into Willoughby; the fact of the number of their regiments being the same; and a certain similarity between their persons—they were both tall and fair—and a delusion that the poor woman had got into her head, that Willoughby, whom she saw one day on parade, was really her husband, suggested to me the practicability of destroying his prospects; and under pretence of assisting her search, I procured from her her marriage contract, which I destroyed, and substituted in its stead a forged deed, imitating Willoughby's signature and those of the witnesses, who I ascertained were safe out of the way. Meenah Bace, who could not read English, and only knew her husband's Christian name, never discovered the forgery; and after making her promise that she would not betray me to Willoughby, who would, I told her, never forgive me for destroying his prospects of a rich marriage, I sent her to you, and my plot succeeded beyond my hopes. Your indignation, and the regiment's sudden removal, were most favourable to me; and though I was deeply wounded at being a second time rejected, it was some comfort to know that my hated rival had no better chance than myself.'

'Can this be true?' gasped Indiana, who had listened in speechless astonishment. 'Surely you could not have been so cruel!—Poor Henry!' she murmured in a low tone to herself, 'if I had only known the truth!—Mr Spurgeon, it is a hard matter, but still I forgive you the wrong you have done me; perhaps you hardly knew how great it was. Although it is late to do so now, I should wish to be able to clear Captain Willoughby's name of the stain that has rested upon it, and write down the deposition that you have just made.'

Spurgeon, who, to do him justice, had never known the extent of her affection for Willoughby, agreed, and affixed his signature to the paper; and then, with trembling limbs, and an agitated look that surprised the nurses, she left the hospital, and hurried home to rejoice her sister with the intelligence that her confidence in Willoughby's honour had not been misplaced.

As she entered the drawing-room, where she knew she should find Miss Keith, she exclaimed, with breathless eagerness: 'O Anne, Henry is innocent; it was all a wicked'—but stopped short on seeing two strangers engaged in conversation with her sister and Meenah Bace. Her bewilderment did not at first allow her to distinguish their features, but she felt a strange trembling as she marked the tall figure of the one who came forward to meet her. No, she could not be mistaken; and in another moment her hands were clasped in Henry Willoughby's, and her tremulous 'Henry, can you forgive me?' answered by their warm pressure. Excess of happiness was almost too much for Indiana after her long trial; but by degrees she recovered sufficiently to be able to learn how this happy meeting was brought about. And first, Colonel Willoughby for he now held that rank—had to present to her

his friend, Major Millingsby, who had unwittingly been the cause of their long estrangement.

'After you left Agra,' continued the colonel, 'I went through all the Sikh campaign, and then my regiment was ordered to Gibraltar. After that—rather unfairly, as we thought, though had it not been for this piece of injustice as we considered it, I might never have seen you again—we were ordered back to India. This time, I saw no service, beyond the trifling business of reducing a refractory Mahratta chief, whose fort we took; and there we found poor Millingsby, who had been prisoner for ten years and more, and was believed to be dead by his own people, and so had never been sought for, and had given up all hopes of getting free again.'

'Yes,' said Major Millingsby, 'if you only knew what that feeling of utter hopelessness was, I could hardly realise that I was free, when the fort was taken.—But go on with your story, Willoughby.'

'Well, Millingsby, when he had recovered his senses a little, began talking of his wife; and when I heard her name and birth, the truth suddenly flashed upon me; and though it was impossible to account for the substitution of my name for his, I felt sure that the mistake had arisen from the similarity of sound, and that you, Indiana, had been equally deceived with me. Of course, I hurried home at once; and I will own that my first impulse was to meet you with reproaches; but your exclamation as you entered the room disarmed me.'

All was now joy and happiness at Number 25; and Meenah Bacc, or, as we ought to call her, Mrs Millingsby, was in a state of ecstacy at her husband's return, though most penitent for the delusion which had caused Colonel Willoughby and Indiana so much misery.

Spurgeon's confession, although not necessary, as it turned out, was satisfactory, as clearing up the mystery of the story; and the wretched man, during the brief remainder of his life, was nursed with tender solicitude by her whose happiness he had so nearly shipwrecked; but who was now, thanks to the guiding of a merciful Providence, after long trials, given back to her faithful lover.

LEFT BEHIND.

THERE are certain dark hours in life when the Spirit of the Past possesses our brains, or our hearts, or our mind, or wherever the seat of Memory may be, to the exclusion of all current or future interests. It is difficult to determine what influence it is which specially induces retrospection, but it may be stated definitely that it is very rarely a cheerful one. When prosperity crowns us; when our fates and wills agree; when our friends flatter, and our enemies dissemble; when our chimneys refrain from smoking, and our critics refrain from censure—when, in fact, the glorious trio Health, Wealth, and Happiness are sojourning with us, then we think little enough of the fears and the follies, the friends and the foes, the hopes and disappointments, the loves and the hates, that we have left behind. Or at most we give them but a passing regret, or a strained and hardly achieved thrill of tenderness.

It is not in the nature of man or woman to be chilly in the sun; to be cloudy under a blue sky;

or to be specially anxious to retrace a thorny path which they have passed, when the one they are treading in the present is carpeted. But when gentle Time crushes us unexpectedly on his wheel after his former manner, then we recall visions of the corresponding sufferings that we have left behind, with fidelity that is either fierce and cruel, or deprecatingly pathetic, according to our natures.

A friend fails us, for instance—a friend to whom we have cleaved in perfect faith for a long time; and the shock administered to our system by the snapping of the chord that had seemed so strong, jerks us back to the day and hour in which we were rudely roused from our first love-dream—hurls us back exhausted and trembling to the time when the first love which had made the beautiful earth a heaven to us was withdrawn, or died, or proved to be a lie. It is a very common experience this—the commonest of all, probably—for the majority of men and women love in the wrong place first. But when we realised one mistake in the days of our youth, how infinitely we would have preferred going on being mistaken! How infinitely we would have preferred continuing in the company of credulous fools, whose credulity made them happy. Any fate, any life, any amount of poverty and disillusioning in the future, we thought would have been preferable to this blow, which cut the earth from under our feet, and happiness from out our hearts, leaving us unprotected marks for the arrows of pity and conjecture, of reprobation and triumph, which were freely let fly at us. As we sit in the dark hour and recall all these things, how humbly we ought to bow our heads in gratitude to the God who enabled us to live through them—how grateful we ought to be that nothing (not even sorrow and mortification) lasts!

What a wealth of fresh good-feeling was swept away from our hearts when that wave of woe broke over us! The fruit of purpose, or the falsity of the one in whom we had believed above all others, shook our faith in the rest of the world possessing a single decent quality. Since the best had proved a broken reed, the second-best must be very rotten sticks indeed. Some glory had gone from us for ever, in that we had loved unworthily, and generally, cast our pearls before swine. And the worst of it was, we could no more recall the love, than we could recover the pearls. They were both trampled upon and tarnished; and perhaps the most painful part of it all for us was (for we were young and unselfish then), that the ones before whom we had cast the loving lavish offerings were not one whit the better for the sacrifice. They beggared us, and did not enrich themselves; and the pain and disappointment, the bitterness and unsatisfactoriness of it all, come back to us crushingly in the dark hour.

The termination of the affair (and it seemed the end of all things at the time) comes in a different guise to every one. But it is not to be disowned; it is recognised at once, and the speedier the recognition the better; for the severing Power will make

himself known, and those who seek to propitiate or flee from him, are the ones on whom he tramps in his stride with the greatest severity.

He comes in a different guise to every one; but how surely is he known. He robs himself in the garb of Prudence, and tells the girl whose heart has been sully stressed, that marriage on less than so much a year is an impossibility. And so it may be in fact, but God forgive the man who forgets that fact in the ardour of the chase; who put it behind him, and made it of no account while the woman was unwon, or had not openly confessed herself to be won; and who remembered it when her barriers were all thrown down, and her deserted position visible to all men.

How many a girl can attest to the truth of the picture that shall be drawn of the hoisting of the first danger-signal. Hitherto, she has been going with the tide, and all has been bliss. Her father has acquiesced (if nothing more fervent) in the scheme she and another have drawn up. Her mother has gone out to meet the new son with effusion—has taken him into her confidence respecting the high hopes she had always entertained for her darling; and very likely made him one of them altogether, by giving him cold mutton for luncheon, and permitting him to smoke in the house. The sisters have kissed and been kissed by him in the demonstratively fraternal way common to humanity on these occasions. The elder brothers have accepted him; and the younger ones have chaffed him in the odious way in which younger brothers do chaff, in season and out of season. When lo! into the midst of this Agamemnon comes a dark spirit, calling himself Prudence, or Honour, or Distrust.

It matters very little in reality whichever name he bears; he means the mischief of utter annihilation of the past, utter separation for the future. He knows no pity, he listens to no reason in which love has a part. 'The thing was foolish from the beginning, and had better be over and done with,' he says. 'How can a fellow who can't keep clear himself, support a wife? A man must be a coward to drag a wife down to a diet of potato-peelings, unrelieved by anything else; and so, hard as it is for him to say it, he must say farewell for ever; and may she make a better man than himself as happy as she would have made him, had fortune been kinder! It had been his part to have thought of all this before, but he forgot his part; and will she, *can* she forgive him, for the sake of the late amends he is striving to make?'

No; she cannot. Not one woman in a hundred, not one woman in a thousand, can really forgive the selfish forgetfulness of all life's responsibilities, which has made the man who has 'wrecked her life' (she piteously thinks at the time) go on unchecked unto this bitter end. He, and his will and pleasure, his comings and goings, have been her life lately. All that had gone before had seemed to be mere nothingness, as soon as he appeared and chose her. And now, some of his passion 'having spent its novel force,' he prefers renouncing her, to renouncing his club, or his horse, or possibly some even less worthy amusement than either of these.

But there are other bitternesses besides this double-distilled bitterness of blighted loves, whose wraiths rise and compel us to confront the memory

of them in the dark hours of our present lives. The first break in the family, the death of the father or mother, the marriage, and consequent parting with a brother or sister. All these things which were so infinitely sad at the time, that in our misery we thought we never could forget them, are often clean forgotten for months, ay, years, until the memory of them is resuscitated by the birth of some kindred woe, whose advent makes us vividly recall all connected with that grief, which has been so mercifully numbed and left behind.

But sadder than all else to contemplate in the dark hours of life is that image of ourself in our youth, which we have left so very far behind. It almost seems to mock us with its shadowless brow, and eyes full of hope, and heart full of good, honest, honourable intentions. It moves our pity, too, as, from the height of our matured and hardly gained experience, we look back upon the creature so fraught with sanguine ardour—so ignorant of the dangers that infest the bright path it means to tread. We can separate our own identity from that of the vision of our youth, and pity and forgive 'this falling away,' 'that failure,' and mourn even as though it were another, over the downfall of nearly all the highest hopes that fill that vision's heart. They were so dear, they were fought for so desperately, they died one by one in such agony; and it seems as though the vision had still to go through them all, while we know that we have left them behind.

How tenderly Time teaches us to look back upon places too!—places in which we have lived, or in which we may only have sojourned briefly, or through which we may have passed only once in our lives. Possibly we did not care very much for them at the time—probably we rather disliked them—thought them too flat or too hilly, too relaxing or too bracing, too crowded or too barren; but now that we have left them, as we firmly believe, for ever, there was, after all, something very pleasant about them, something that one feels very much inclined to regret, on the whole.

That chilly little village that looked on the borders of a broad marsh-land (even fond Memory cannot paint it as anything but a chilly, barren, deserted kind of place), what a hearty reception it always accorded the chance stranger who came that way. It grasped at him, as it were, and treated him to its best without reserve. And 'its best' was a very good thing, for its farmhouse 'kitchens had richer roast' than one meets with, as a rule, when one takes a place by storm as an angel unawares. And its east winds—ah! how bracingly its east winds bit!

That gossiping, idle, enervating little country town low-lying in a warm, relaxing hole on the side of a hill, in the heart of a western county: looked back upon through the kindly veil of Time, its scandalous gossip has a touching semblance of friendly interest, and we wonder at ourselves for ever having been either worried or wounded by it, and wish that we could create that friendly interest now! For in the hours of brooding retrospect, the idea will at times intrude itself that the world is growing old indeed—far too old to care for us, or for what we do, or leave undone. Cold indifference appears to surround us; we can no longer excite pity, admiration, love, or surprise.

The old are falling away from us, either into the grave, or into a state of selfish unconcern as to all others; and the young are growing away from us, into warmer, keener interests of their own. And yet, even while we feel this intensely, with dull aching of heart, the silver lining garnishes the cloud, and merciful memory creeps in upon us, telling us that this saddening phase of feeling must, in the order of things, soon be left behind.

A VISIT TO A JAPANESE SILVER MINE.

A WRITER in the *Hingo News* lately paid a visit to the great silver mines of Ikuno, Japan, where European machinery has been introduced with great success; and as his account of what he saw is of considerable interest, we condense from it the following notes. On the hillside above the works, the objects which first attract the visitor's notice are the house (on a small platform) of the stationary engine, used to work the shaft now being driven down into the rock; a number of places like large rabbit-holes; and a tramway which runs round the face of the hill and connects these holes with a series of shoots down which the ore is passed to the works. These holes turn out to be galleries (six feet by six), which already measure eight miles in length; in them is seen the process of removing the ore by blasting, the fuses for which were at first imported from abroad, but are now made on the premises, at a saving of more than seventy-five per cent. The ore is broken up into pieces at the mouths of the shoots; the least rich lumps and those containing a large amount of other minerals are set apart for consumption at convenience; while the best pieces are sorted into five classes, their estimated values ranging from about sixteen to one thousand pounds per ton. These are pounded into dust in crushing-mills, and the dust baked in ovens with common salt (chloride of sodium). Hitherto the silver has been combined with sulphur, but in these ovens a chemical change takes place, the chlorine of the common salt combining with the silver and the ten or twelve per cent. of gold which the ore contains, and the sulphur of the silver combining with the sodium of the salt to make Epsom salt, which goes into the river and poisons the fish. The ore—now a red earth—is then, by means of water and iron balls, thoroughly mixed with a large quantity of quicksilver by the aid of revolving drums. Under this process the quicksilver takes up the precious metal, and when the amalgamation is complete, the drums are emptied and the mud washed away. The combined metals are next treated by hydraulic pressure against a leather sieve, through which free mercury is extruded, leaving a putty-like brilliant white amalgam. Heated in iron retorts, the remaining mercury in the amalgam is driven off into a condenser to be used again; and the resulting lumps of metal having been fused with borax, which brings away some scoræ and other impurities in the form of scum, are run into moulds and sent to the mint at Osaka. The metal contains, in the form in which it leaves Ikuno, about seventy per cent. of silver and ten of gold, the remaining twenty per cent. being nearly pure copper. The power utilised to drive the machinery at the Ikuno mines is mainly water, which is brought four miles and a half in an artificial canal, and may be taken for nine months in the year at two hundred and fifty gallons

per second, with a fall of one hundred feet. During the rest of the year this water-supply fails, and the works are driven by steam. The Japanese government derives a handsome revenue from these mines, which will be greatly increased when the copper is worked independently.

THE ERL-KING.

Wha's ridin' sae fast i' the gloamin's licht?
Wha's ridin' sae late through the mirksome nicht?
A faither, wha clasps aye mair close i' his arm
His ae bonnie laddie, sae bielded frae harm.

'My bairn, what gars ye aye cow'r doun your een?'
'O faither, hand fast! it's the Erl-king I've seen—
The Erl-king, wi' his croon an' his glamourie.'
'My son, it's a driftin' clud that ye see.'

ERL-KING.

'No'er hae I seen sae fair a face!
No'er hae I viewed sae sweet a grace!
O gin ye'll gang wi' me, we'll play
On gowden shores the lee-lang day.'

'My faither, my faither, O dinna ye hear
What the Erl-king whispers sae laigh i' my ear?'
'Noo whisht ye, my bairn—it's some weary win'
That has tint a way whilk it canna fin.'

ERL-KING.

'O come wi' me to my far-af hame!
Ye sall kame your locks wi' a gowden kame.
My dochters their watch by your side sall keep,
An' rock ye, an' kiss ye, an' sing ye to sleip;
They'll rock ye, an' kiss ye, an' sing ye to sleip.'

'My faither, my faither, an' dinna ye see
The Erl-king's fair dochters aye beekon to me?'
'My son, it's but yonder gray willows' saft sheen
Ye tak for the glint o' their starry een.'

ERL-KING.

'It's oh, bonnie bairn, but I like ye weel;
Noo, yield ye, I rede, or my pow'r ye sall feel.'

'O faither, O faither, hand fast by me noo!
For his gruesome han' it lies cauld on my broo!'

The faither shuddered—his heart grew a stane,
But he grippit his bairn, an' mude ne'er a mane.
He sped to his castle wi' meikle drede;
Wae's me! In his arms—the bairn lay doid!

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. To insure the return of papers, that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.
- 4th. MS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

LIMPETS.

By the outside look of things, there is scarcely a more anomalous creature than a limpet. A mollusc, soft and squashy, without limbs to grasp or horns to push, it has a power of adhesion which resists even a strong man's pull, and clings to its sterile home of slate or granite with a tenacity greater than energy, and more determined than aggression. Nothing short of a trick can whip it from its holding. Like a political party which can be swamped only by a *coup d'état*, a limpet can be detached only by sleight-of-hand, and the crafty insinuation of a 'persuader' unawares, thrust home before the boneless creature has had time to feel and resist. How comes it that an invertebrate like this can be so strong to resist, so all but unconquerable in its tenacity and immobility? A fighting crab can be broken up into little bits where a limpet is secure; but a fighting crab is to a limpet as a grenadier, six feet high and armed to the teeth, is to a little woman four feet nothing, and with no other weapon than may-be her tongue and her determination of Will Not. Yet, in any conflict short of fist-cuffs between them, the little woman will hold on, and the grenadier will be nowhere.

The limpets of humanity are as odd in their own way as their prototypes on the sea-rocks, being for the most part as weak and as tenacious. Do you think that staying-power and having one's own way reside in those men so dear to novelists, whose lowering brows, square jaws, and resolute chins betoken qualities which rule men and fate, and are as the seals set against their charter of supremacy? Not a bit of it! These formidable-looking creatures can be conquered by the molluscs who only hold and resist—say No, and do not fight; and in general they are wise enough to acknowledge their victors. They may be kings of men in their own way, but that way is not one which subdues the limpet; and the fragile little woman with a shrill voice and a sharp nose, or her sister, phlegmatic, tenacious, and unimpressionable, will have the whip-hand of them at all four corners. Neither

kind fights; for fighting implies activity; and the limpet has but the one quality of tenacity and repression—the power of saying 'I will not,' and of sticking to it; which is a very different thing from active contest.

No man has yet known how to influence the limpet to the reception of new methods. Old habits, old places, the forms of thought into which it was born, the range of knowledge to which it attained on its first and final essay up the steep hill of learning, are the foot-holds of security to which it clings as for dear life. Anything beyond is an impertinence if advised, a tyranny if enforced; but who can enforce anything whatsoever against the *vis inertia* which refuses to be moved, and says 'I will not accept?' That *vis inertia* is found for the most part to be superior to any amount of active energy, of brisk aggression; and tenacity wins the day which conflict would have lost. You detail a new truth; you reason it out from the beginning to the end; you shew how it grows by the irresistible process of logic from the premise which is undeniable, that two and two make four, to the conclusion, which is as undeniable, that four and four make eight. You trace it through its various stages of development from root to crowning flower; and when you have finished, your mental limpet looks you blankly in the face and says tranquilly: 'I do not agree with you; and I prefer the theory which springs from the radicle that two and two make five.' For the limpet the circle of the sciences ends at that point when he or she left school; and what more the world has gained since then is assigned without hesitation to Carlyle's Limbo of the Unveracities. Developments are not in his line; neither are aggregations; and he prefers the repose to be found in absolutism and arrestation. The sterile rock whereon he was cast at his birth, and where he manages to gather the poor nutriment by which he lives, is good enough for him; what does he care for the flowery pastures, the sublime heights of advanced science? He prefers his gritty granite and his wave-washed nutriment, brought and not sought; and the nobler forms of

thought—nobler but unsettling, difficult, distracting—may be the property of those who will. Only let him be safe from the whirl of opposing currents, free from the troubles, the dangers of selection from among a multitude of may-bes; let him be bound fast to his stable rock however sterile, and die the mental limpet—unchangeable, uneducable, impossible to influence, and incapable of development—that he has lived!

What is true of new thoughts, and facts even, is true also of habits. No power on earth can make the limpet among men change his ways or adopt strange modes of life and action. He would rather starve in the groove which gives him a scanty crust at just the same time, and served in just the same manner day after day and year after year, than break fresh ground for himself, and go further afield into plenty of a different form and different surroundings from those to which he has been accustomed. Ask a limpet of this kind to emigrate—that is, to go where there is space for all and plenty for those who will work—and he tells you that he prefers to stick to his overcrowded rock at home, where the best will in the world for work cannot give him enough whereby to live as a man should, because there are two men for one job, and the earnings which would be enough for one have to be divided into insufficient portions for many. Paint nature and possibilities at the antipodes as you will, and however splendidly, not outside the truth; shew the one beautiful, fertile, facile, the other such as make men glad and great—he shakes his stolid head, and digs his stick into the ancestral sand, as he replies: 'I prefer home with starvation to foreign parts and plenty.'

As you cannot take him bodily, as the roc took Sindbad, and drop into the midst of the fat lands waiting for men to come and be made happy, you can only leave him to his scanty crust and to the plot of sand wherein he has planted his stick. But you think, when you hear him complain of the difficulties of getting anything to do in this swarming hive of ours, and of the miserable pay for it when got, and his domestic anxieties and his family shortcomings, that his limpet-like reluctance to move is, in point of fact, responsible for his misfortunes, and that, if he had chosen to accept new means, by this time he and his would have been rich and happy. Your only consolation is, that the creature had not the qualities fitted for the career proposed to him. He has just that one kind of strength which comes from inertia, the stability of a mass of dead matter left untouched and to itself; and a life that made calls on his energy would find the draft dishonoured. This molluscous 'inhabitiveness,' as the phrenologists call it, is the strong point of his nature, and he bears anything rather than lose his hold on things and places to which he has been accustomed, for the sake of the wider issues to be found elsewhere.

Women, naturally of a less wandering nature than men, have this kind of limpet-like tenacity to place very strongly developed; and women of the peasant class above all. To them, a removal of three miles from the old home is more than to others is the removal of so many hundreds; while translation from Cornwall to Cumberland is an infinitely more formidable expatriation than is the translation from England to India to their sisters of better estate. We once saw a Cornish woman in the deepest distress because of the migration

of her husband from the little cove where she had been born, and had lived all the thirty years of her life, to another about two miles distant. It was as if she had received marching orders for Timbuctoo, or was doomed to eternal separation from her mother, friends, and home. Her heart was broken, she said between her sobs, and she should never get over her sorrow. Which surely was a development of limpet tenacity, and holding on to the place of one's birth, about as extreme as can be imagined.

Try to teach a limpet new ways, and see where you land yourself. A woman who has been accustomed to feed her children improperly, to clothe them injudiciously, to manage them on wrong principles—shew her new ways and better ones: will she adopt them, think you? Will she do that which is unusual to her, and forbear to do that to which she has been accustomed? As little as her husband will leave his plot of sand at home, for rich acres over seas; as little as the mental limpet will accept new readings of old fables, new faces of old facts! What did for her mother, is good enough for her, she says, as she crams her baby with thick pottage, and lets her little ones get wet with the rain and dry again in the wind. What hawking is this about open drains and polluted water? They have had that ditch before their house ever since she can remember; the well in the yard near the byre served father and mother and all of them long before these new fashions in air and water came up. You may talk till you are hoarse of carburetted hydrogen and the like; what your limpet cannot see, and touch, and taste, that is for him or her a substance non-existing, and the dangers predicated are mere bogles set up to frighten fools. Your limpet will have none of them; so you may spare yourself all trouble, and leave the ditch and the well, the poisoned air and polluted water, where you find them; and when typhus and diphtheria break out in the household, it is God who sends the scourge, not the uneducability of the limpet which fosters it.

Incapable of education or of change, the limpet is also sure to stick when once placed. Woe to the inconstant person who has a limpet on her visiting list! No efforts short of mutilation by violence can dislodge the creature that holds on to the rock, and nothing short of the plain-dealing known generically as 'cutting,' can shake off the acquaintance who sticks closer than a brother, and is as tenacious as a burr. You have no wish to be on such very friendly terms with your limpet. You do not think that a casual acquaintance, made in the press of the season, as half a hundred others like to it have been made, carries with it obligations to which you must make part of your life subservient; and you secretly resent the devotion which demands so much trouble in the reception. Why should your limpet fasten itself on you so pertinaciously? It may be flattering, but all the same it is embarrassing to be made the arbiter of another's soul and life. You have no time to spare for so many requirements outside your own immediate duties; and you find it quite as much as you can do to regulate your own affairs with becoming zeal. To be asked for counsel at every turn, to be besought to guide a career with which you have nothing to do, and wherein you feel only the faintest, most tepid kind of interest, is a nuisance which you must have either an inordinate love of power and

praise, or a supremely kind heart, to endure with equanimity. Are the drawing-room curtains to be red or blue? Shall my dress be white or gray? Shall the dinner be fixed for the sixteenth or the seventeenth? and which school would you advise for Frank, Winchester or Harrow? The questions, small or large, which torment your limpet are made to torment you, on the principle of passing it on; and you have to bear on your own shoulders burdens which you neither packed nor strapped, because your friend is too molluscous to carry them on his or her own.

Your limpet has no sense of times or fitness, of the length of hours or the shortness of the days. He or she pervades your house at all times, from early morning to late at night, and sits as if the spirit of immobility had suddenly become incarnate. It may be that you are asked for direction on some pin's-head kind of event; or it may be that you are not asked even for so much. All the same, the limpet sits, and you have to endure; unless you take politeness and hospitality by the shoulders and sling them out of the window before shewing your sessile mollusc the door. Common-sense would tell you that you were justified in so doing; for time is precious, and your duties are imperative; and really, if limpets will not learn without rough teaching, well—the teaching must then be rough, and the ‘persuader’ to dislodge them sharp and straight! Give a limpet an impression, and try hereafter to efface it. However erroneous it may have been, and however sharp your sorrow for having thoughtlessly given so much increased circulation to a falsehood, however clear your proof that you had been mistaken, and earnest your endeavours to put straight that which you had laid askew, your limpet is immovable. You had told him that Mr So-and-so had been found guilty of card-sharpping, and having told him, he believes what you said. It was you yourself who confessed that Mrs So-and-so was rather more than indiscreet in that matter with young Lovelace; and it is of no good to say that you had been misinformed in both cases. You rubbed the gritty falsehood on to that poor pulpy brain of your tenacious mollusc, and it holds what it has once got. It knows nothing of your plastic ‘yes’ to-day and ‘no’ to-morrow, your nomadic faith that anchors itself on the sand at night, and is flouting in mid-ocean by the morning. What it has heard, that it receives; what it has once believed, that it holds, and no efforts can shake it from its place. Save for the inherent valuelessness of the creature itself, we know of no responsibility more appalling than that of determining a limpet's creed, and giving it a surface whereto its poor, soft, flabby mind can cling, and whence it can never be detached. For with it, first impressions are everything, and the modifying power of reason is nowhere. It cannot shape itself to new conditions, nor accommodate itself to another set of circumstances. The waves which wreck strong ships, dash harmlessly over the passive pulpy mollusc sheltered beneath its shell of defiance, and holding on by its rock; the hand which can wield a sledge-hammer which can strike a man till he dies, cannot, so to speak, detach a miserable tenacious little bit of organised protoplasm, which has simply the force to resist and the power to hold on. It is wonderful; but in it we can read the tremendous force of negation, and what energy it takes

to move the inert mass of men to other regions of thought than those to which they have been accustomed, to lift them to higher states of knowledge than those whereto they attained in their learning days. Limpets as so many of us are, it is well to know the line that should be drawn between constancy and stolidity, fluid incapacity to retain and immovable inability to receive. To hold by that which is good, is one of the means of noble living, but to reject that which is better is the action of a fool. Even high aims are not always proof against this obstinate rejection of new views; as Bolingbroke says: ‘The confirmed prejudices of a thoughtful life are as hard to change as the confirmed habits of an indolent life;’ and we all know men who have crystallised into beautiful shape enough—but crystallised once and for all time—at an age when others have not completed half their growth, nor perfected half their powers of evolution. *Tinac et fidelis* is a good motto, but *accelior* is a better.

FALLEN FORTUNES.

CHAPTER XIX.—RESUSCITATED.

If the doctor himself had not chanced to have burned his fingers at Commercial Snapdragon, and received not even a raisin for his pains, he would doubtless have been considerably puzzled by the laconic advice contained in the violated letter; but as it was, he could make a pretty shrewd guess at what was actually the state of the case. The *Lara*, he was at once persuaded, was not a ‘young person,’ but some speculative company in which Dalton was mixed up, and of which he would have been willing—if he could—to have washed his hands. Perhaps it was the collapse of this very concern that had brought him to his present pass; and if so, here was a confidential communication bidding him not to abandon hope with respect to it, but to hold on. It might, it is true, be only a word of advice concerning some ordinary business speculation, in which case there could at least be no harm in Dalton's reading it; but the probability was that the tidings were good—calculated to put him in better heart.

Hitherto, the doctor had taken matters very quietly, and may seem to have pushed his philosophy—as philosophers sometimes will do, in the estimation of ordinary folks—to downright brutality; but both head and heart were in truth in accord with this good man, and were working together for good. Now that he had a stimulant—as he hoped—to administer to his patient upon recovery, he lost no time in resuscitating him. Raising Dalton's head, and supporting it on his own knee, he drew from his pocket a bottle of what looked like smelling-salts, except that it was much darker, and applied it to his nostrils. Then he dropped a few red drops from a phial between his lips, whereupon the eyes of the patient opened slowly, stared at his companion without recognition, and then gazed inquiringly about him.

‘This cannot be death,’ murmured he feebly.

‘No; it is not death, Dalton; and if you are a man, you will thank God for it,’ said Dr Cayron gravely.

Not a word was spoken for some moments, during which ‘speculation’ began to gather in the patient's eyes. The miseries of his position, from

which he had in vain attempted to escape, were forcing themselves upon his mind.

'You have deceived me, doctor,' groaned he despairingly. 'What you gave me was not laudanum.'

'I have saved you, rather, my friend, in spite of yourself. If it had not been for my pardonable stratagem—for never had a pious fraud so much of piety in it—you would have been at this moment in Gehenna, among all the other murderers.'

'Murderers! That is a matter of opinion,' answered the other doggedly. 'I should have put an end to my own life, it is true, and I do not thank you for having given me a longer lease of it.'

'Bah! I was not speaking of *your* life at all. When I say "murderer," I mean a man who slays not himself, but another; in some cases (when the thing is comparatively venial) from mere passion, in others with selfishness and calculation; in such a manner would you have slain—your wife!'

'My wife! my Edith! Why, I died for her.'

'You persuaded yourself so, no doubt; yet your death would have killed her. If I did not take you home—as I mean to do—this night, your very absence would go nigh to do it. We men being so worthless, have no conception, sir, at what a fancy price we are estimated by our women.'

'I am worthless enough, utterly worthless,' groaned Dalton; 'and much worse than worthless.'

'Look you here, doctor!' exclaimed he, starting to his feet with sudden anger, 'you have been meddling in matters with which you have no concern, and which it is impossible you should understand. How it was that you guessed my purpose, I cannot tell, but being ignorant of my necessities, you had no right to thwart it. You have done me an injury—which being done, can never be repaired.'

'I know it,' replied the doctor coolly; 'and I am glad of it. Your plan of committing suicide, without its appearing to be suicide, has now failed for good and all. Should you ever again attempt this wickedness, John Dalton, no matter where, I will come, though it be from the ends of the earth, to bear witness to what has happened to-day!—Please to sit down, sir, or you will be observed from the house.'

'And this is one who calls himself my friend!' said Dalton, obeying him sullenly.

'Yes; and it is because I am your friend, and the friend of those who love you far beyond your deserts, that I am forced to do it. Of course, you are in some dire distress.—Nay—for he was about to speak—I do not seek to pry into its nature. I took it for granted that you were pushed very hard, and that you felt it most because it affected others.'

'I did, I did,' answered the wretched man.

'Well, would not those others have those ills to bear, and your loss as well? To one at least, that would have been worse than all other losses. I tell you—I, who know her well—that it would have slain her.'

Again there was a pause, during which Dalton sat thoughtful yet irresolute, with his eyes fixed upon the ground, and his fingers plucking at the grass.

'How did you come to know that I was thinking of this thing?' inquired he at length.

'From your own words, and manner. I did not believe in your toothache, from the beginning.'

And if you had no toothache, why should you need laudanum? Then again, in our first talk, you said, with respect to having your tooth out, "I cannot take chloroform;" whereby you wished to put the idea of your having heart-disease into my mind, before you came to consult me about your health. These suspicions, slight in themselves, were strengthened and corroborated by your behaviour during our interview. When I asked you, "Is your life insured?" it was not, as you imagined, from any idea that it was in danger from disease, but to discover whether those belonging to you—for I never paid you the ill compliment of supposing those were not uppermost in your thoughts—would reap a benefit from your decease. Your whole manner under the examination was artificial and unlike yourself; and your replies were technical replies—not natural ones, such as are given by genuine patients, but learned out of a book. When I said, "You have heart-disease, you think?" quite suddenly, you did not put your hand there, as a man probably would have done who really had it; yet it was evident to me all along that you wished me to believe so. Then again—in spite of my suggesting other remedies—you reiterated your wish for laudanum, which at the same time you strenuously objected to my putting down in my little account. Taking all these things into consideration, I said with perfect truth, that "I should not be surprised if you died suddenly," for by that time I felt convinced that it was your intention to put an end to your own existence.'

'I thought I had convinced you that I had heart-disease,' observed Dalton naïvely, his mind for the moment diverted from its gloom by the doctor's statement.

'No, my friend; you only convinced me that you wanted to have it. When a man says "I thought," when he ought to say "I feared," as you did, he generally means "I wish." I could not tell you my suspicions, lest in so doing I might precipitate the catastrophe—though, in truth, I never guessed how near it was; but I resolved to tell you my wife.'

'Tell my wife! Why, you might have killed her.'

'What! you can see danger, where you could not see destruction! Do you suppose my hint of what you meditated could have harmed her worse than the news of what you had done? It was my duty, of course, to set her on her guard; to provide her with remedies, in case you should put your rash design into effect; and I was taking her the very things in my pocket with which I have just brought you back to life, when I heard that you had not returned to Riverside. Of course, if it had been really laudanum which you carried away with you from my surgery, no human power could have saved you; but as it is, you are none the worse than you were three hours ago.'

'And none the better,' answered Dalton wearily.

'But others are better—those others for whom you profess to have risked so much.—Come, be a man, since you must needs live on. There is work for you in the world of some sort, as for every one else. And you, of all men, with your troops of friends'—

Hitherto, although striking almost at hazard, the doctor had been very successful in his arguments, but here for the first time he touched a wrong chord.

'Work!' cried Dalton bitterly; 'nay, that is just what is denied me. It is not much, one would imagine, to ask of Fortune, permission to spend one's life in toil, yet she will not grant it to me.'

'Pshaw! she has refused it to ten thousand men to-day, sir, as worthy as yourself, and with more pressing needs.'

'That is impossible, Curzon. You do not know — Well, I will tell you,' said Dalton, suddenly interrupting himself. 'This man, to whom you would apply your maxims of philosophy, whose wife and children—and their needs—you are as well acquainted with as himself—has been ruined. When I say Ruined, I mean it; and by his own insensate selfishness and folly.'

'Don't use such hard names, my good friend,' interposed the doctor quietly, 'because, though you apply them to yourself, they may fit other people. I have been ruined myself by one of the most promising and remarkable mines'—

'Not the *Lara*?' cried Dalton, grasping his companion's arm in passionate excitement.

side,' observed the doctor authoritatively. 'Every minute of your absence, remember, gives a pang to your wife.'

'At once, then,' said Dalton, stepping out, as he spoke, towards home with an elasticity that did not escape his companion's notice. The one tiny spark of hope had already relit the embers of life within him.

'Remember, my friend, you have been seven hours from home, and will have to account for them. You are a married man, however, and doubtless fertile in excuses.'

'Seven hours!' exclaimed Dalton in astonishment; but a look at his watch confirmed the doctor's statement.

'You would have slept half the night here, had I not awakened you by my incantations,' continued the latter. 'Now, let us both be in the same tale to account for this. You were coming over to Sanbeck to see me about your toothache; and finding me out—you *did* find me out, you know—you waited until I came home, and so you were delayed. But there; your wife will be too wel'

—for if ever there was a case where 'the truth, the whole truth, and nothing but the truth' might not be told, it was surely his; and in their joy at seeing him, they did not question him very closely. Edith was not down-stairs among the welcomers or reprovers ('A pretty fright you gave us,' said Mrs Campden; 'it is my belief you have come home so late merely to have an excuse for not dressing for dinner'); but was in her own room, waiting for him, with a pale face and anguished eyes.

attain their fifth year, in the worst localities one-half die before they attain that age—'sacrificed as needlessly as if they were taken out on Bethnal Green and shot.'

Dr Smith worked even as he thought, on a grand scale; nothing short of sweeping and sufficient reforms could content him. How successful the reforms then inaugurated have been, the present condition of East London at this moment, as compared with fifty years ago, affords ample tes-

a practical basis. He at once risked three thousand pounds in the experiment, and with the money three houses in Marylebone were purchased—'well-built houses, but in a dreadful state of dirt and neglect. The place swarmed with vermin; the paper, black with dirt, hung in long strips from the walls; the drains were stopped, the water-supply out of order.' All these things were put in order, *but no new appliances of any kind were added*, it being determined that the tenants should wait for these till they had proved themselves capable of taking care of them. 'A regular sum is set aside for repairs, and this is equally divided between the houses. If any of it remains, after breakage and damage have been repaired, at the end of the quarter, *each tenant decides* in what way the surplus shall be spent, so as to add to the comforts of the house.' This plan, says Miss Hill, has worked admirably; the loss from carelessness has decreased to an amazing extent. And the lodgers prize the comforts they seem in some measure to have earned.

tenants. The wash-house, full of lumber belonging to the landlord, was locked up. The dust-bin in front of the houses was accessible to the whole neighbourhood. The state of the drainage was in keeping with everything else. One large but dirty water-butt received the water laid on for the houses. It leaked, and those who did not fill their jugs when the water came in, or had no jugs to fill, had no water. This court is now under Miss Hill's own management. During the four years she has held it, she has *never* allowed a second week's rent to become due. The place has been made to pay itself for new grates and new windows (out of one hundred and ninety-two panes only eight were unbroken); the drains have been put in order, a slate cistern fixed, the yard and foot-path paved, staircases repaired; and—what is the real point of the whole—the tenants (of course subject to ordinary fluctuations) are the same people who lived under the disorder and discomfort of the old régime. Five per cent. interest has been paid on all capital invested; and already interest has been paid on capital spent in building a large room where the tenants can assemble on various occ.

them fit for improved dwellings, by a gradual process, she found, in working the plan on a larger scale, the hopeless condition of much of the cottage property with which it would be necessary to deal: courts so inclosed that the light of the sun could not penetrate; nests of fever, which needed not restoration, but demolition; desirable houses with defective titles; houses radically and incurably afflicted with ground-damp. Some houses were found which might be condemned and pulled down under Mr Torrens' Act; but that Act gives no power of compensating the owner; nor does it empower any public body compulsorily to acquire the different interests in the defective houses, so as to render the desired reforms possible.

In this difficulty, those most interested

which might be purchased and improved; it is the human agency, the whole army of kindly, clear-headed, practical volunteer labourers who are needed.

MY FRIEND OF THE THOUSAND ISLANDS.

THERE is no one like him! at least I think so, and I am sure you would agree with me, if you knew him as I do. How and when we met, you would never guess, but you shall hear all about it.

We had started on a summer tour—my father, Sister Alice, Cousin Fred, and I; and after a flying

of the water in a most tantalising manner. Fred, who had made a special purchase of new tackle, selected with much care one of the liveliest minnows from the pail, and handled his rod with all the confidence of an old piscator. He had hardly spun his minnow once or twice, when he exclaimed: 'By Jove! a bite, and a splendid fellow it must be!' It was certainly something out of the common, to judge by the tremendous resistance he encountered; but, alas! he discovered, to his great mortification, that it was only his line which had become entangled among the rocks at the bottom; and when he recovered it, it was minus both bait and hooks. I had always decried angling as a cruel pastime, and declared that I could not understand any one enjoying it; but, alas! for the inconsistency of poor human nature! I soon forgot my compassionate scruples in the pleasurable anxiety

kindly nature; add to these items, hair, moustache, and whiskers of that rare real brown, so much to be admired, and a tall, well-built figure, attired in a very becoming yachting-suit of dark blue, and you have a fair portrait of Roy Percival, as I first beheld him, in one of the loveliest spots that ever gladdened the eye of man.

In due time we were seated at a well-spread table, extemporised out of the seats and cushions of the boat; and never did hungry mortals enjoy a dinner more. Everything was delicious! Such bread, butter, and tea we never tasted before; and as to my fish, the *pièce de résistance* at the banquet, the flavour of it was unanimously pronounced to be 'perfectly elegant!'

After doing ample justice to our repast, we started for a stroll over the island, and I found myself walking with Mr Percival. Observing that I

On the following morning, we resumed our journey, starting by an early boat for Montreal. Of our further travels, which are in no way connected with my story, I shall merely say, that after two or three delightful weeks spent at Lake George, Trenton Falls, and the Catskills, I was glad to return to the old home-life in Brooklyn, New York, where we lived our various adventures o'er and o'er again, in recounting them to numerous interested and sympathising friends; nor did I escape a certain amount of good-natured quizzing about the interesting stranger who had evidently made an impression on me, which assertion of course I indignantly denied.

Months passed away. To the dazzling, sultry

hands cordially with Mr Percival, and speak of the unexpected pleasure of meeting him again.

'Why, I was not aware that Mr Percival was a friend of yours!' he exclaimed. 'You never mentioned him to me.'

Before I could explain, the gentleman in question related, in his quiet, amusing way, the circumstances of our meeting; adding, that he had been unexpectedly detained in New York for an indefinite time on business, and there had met Mr Stanwood at the house of a mutual friend. Being a stranger, he was glad to accompany him on his visiting expedition, without, however, having the least idea that one of the calls would be on our family. Harry, who had nearly two

the prominent features of his character, allied to a genuine kindness of heart, which extended itself even to the brute creation, with which he was an especial favourite. A well-known poet has said :

He prayeth well who loveth well
Both man, and bird, and beast.

This I firmly believe ; while, on the other hand, one who can be guilty of the detestable cowardice of ill-treating a helpless animal, is in my opinion capable of anything bad.

Of course, I did not find out all this about Mr Percival in a day, nor even in a month ; but from time to time, little by little, as, under varied circumstances, one point of his character after another came out into relief ; and the more I saw of him, and the better I knew him, the more I liked and esteemed him. And he ? I have no secrets from you, gentle reader ; the liking was certainly mutual ; but beyond that, our intercourse was strictly within the limits of simple good friendship, nor had a single word been spoken of a nature likely to disturb the frank and pleasant relations between us. Happy in the present, I cared not to think of

when he said that it was late, and he must go, and actually rose from his seat, my lips quivered, and only with a painful effort could I keep the tears from springing to my eyes.

He came to me last, and said—not ‘good-bye ;’ that I was spared—but, ‘Good-night ; I hope we may meet again, Miss Nathalie.’ I know he held my hand longer than usual ; he seemed to hesitate as he followed the others into the hall, and turning back once more, said again, ‘Good-night, Miss Nathalie ; God bless you !’ That was all.

I know well, for I have seen it, that many girls situated as I was would have sought and found comfort in the sympathy of some dear and confidential friend of their own sex. Far be it from me to censure them, but such was not my temperament. Once conscious myself that I loved, my very first thought was sedulously to conceal the fact from all others. Not even my own beloved and most tender of mothers dare for an instant suspect the existence of a secret which I resolved to bury like a forbidden thing in the recesses of my own bosom. I hold it, there comes a time in the life of every true woman who has ever lov-

thing also disturbed my peace of mind. I have spoken of Harry as a dear and intimate friend; such he had always been to me. Playmates in early childhood, I had ever felt for him simply a sisterly affection, nor for one moment anticipated his looking upon me in any other light; and although, during my acquaintance with Mr Percival, I might have seen somewhat less of him, my feelings were quite unchanged, and I always rejoiced to have him make one of our circle.

A few days before the wedding, Alice said to me: 'Nathalie, I verily believe Harry Stanwood is falling in love with you.'

'What nonsense!' I exclaimed; 'why, we have known each other since we were that high!' designating a very Lilliputian measurement with my hand and the floor. 'We are just like brother

own dear little wife?' The pain he was causing me must have been written in my face, for he continued: 'Do not answer me now: you do not know your own heart; I have surprised you.'

'Harry,' I said, speaking very slowly and distinctly, 'I must say all I have to say now. I am so sorry—very, very sorry—that this has happened. I wish I could have prevented it, for I cannot marry you—I cannot love you as you wish.'

He let go my hand, and turned very pale, but only said in a changed tone: 'Do you then give me no hope, Nathalie?'

'I cannot—I dare not, dear friend. I must be true to myself and to you.'

We spoke but little during the remainder of our ride, and, on arriving, Harry refused to come in. His abrupt departure, and my tell-tale face, quickly betrayed that something unusual had

'Why, among the arrivals in the *Erin* I see the names of Mr and Mrs Roy Percival. If it is the same—and the name is uncommon—he must be married!'

I felt sick and dizzy; for a moment, everything was dark before my eyes; but appearing still intent on what I was doing, I replied cheerfully: 'I guess it is the same; he always had a great fancy for America. I hope he has a nice wife.'

My father coming in at that instant, I left the room upon some pretext, and took refuge in my own little sanctum, which could have told so many tales.

As I knelt down by the open window to let the cool breeze fan my burning brow, the bright sunshine and the merry chirping of the birds in the yard seemed to mock my misery. It was so hopeless now! Yet what else had I been looking for? I had been hoping against fate. What claim had I upon him that he should not marry, and bring his wife to see me, and expect me to welcome her? Would he come? Certainly; for that I prepared myself. Mentally, I rehearsed the meeting; what I should say; with what dignified, yet kindly composure I should receive them; yet, in spite of all my resolutions, every ring at the door sent a shock through my frame, and I trembled for the firmness of my self-command!

The next day was Friday. A sleepless night and so many hours of feverish suspense were more than I could bear; I was really ill; and yielding to the earnest solicitations of my mother, reluctantly consented to remain at home while the others went to the weekly prayer-meeting.

They had scarcely been gone ten minutes, when a ring at the hall-door bell made my every nerve tingle. I had been standing idly at the back window; but hastily snatching some crochet-work of my mother's from the table I had not the remotest idea how to manipulate it—I had seated myself on a sofa with my back to the light, before the girl announced 'Mr Percival!'

As he entered, his face brightened. I never saw him look better, 'nor happier,' I thought, with a pang of jealousy which I could not wholly suppress. My heart beat so violently, I could hardly speak; however, with some faintly uttered words of welcome, I advanced to take the hand which so warmly grasped mine. After various inquiries, which he answered at random, for I did not know what I was saying, he remarked: 'Bye, and 'Sa'—surprised to see me!' 'title. In reality, as we had seen the arrival in the *New York Times*.'

'Indeed! I had not time to look at the papers yesterday.'

'I hope Mrs Percival did not suffer during the passage?' I asked, determined to broach the subject myself.

'Oh, not at all, thank you! She is a capital sailor. She would have come to see you to-night, only she has a bad cold.'

'I wonder, will she like America as well as you?'

'I hope so; though at her age one does not become so easily acclimatised.'

At her age! Then she was not young.

'She is very anxious to meet you,' he continued; 'I have often spoken of you. Won't you soon come to see her?—and Mrs Howard too? I am sure she and my mother will get on famously.'

His mother! What did he mean? Could there be any mistake?

'I hope you left your mother and sister well?' I asked. With what anxiety I awaited the answer!

'Left—my—mother!' he echoed slowly. 'Why, we have been talking about her for the last ten minutes!'

In an instant the truth flashed across my mind. It was his mother, not his wife, who was the lady named in the paper! He also seemed to suspect some strange misapprehension.

'Of whom else could you have possibly thought I was speaking?' he asked, with a funny look in his eyes. 'Come, now, confess!' seeing that I hesitated.

Well, what do you suppose I did then? Alas for my dignified composure! The sudden reaction in my own feelings, and a keen sense of the absurdity of the position, were too much for me; I answered him with an uncontrollable fit of laughter! He waited patiently till the paroxysm had subsided, then quietly repeated his question.

'Well, the fact is,' I stammered out, while I felt my cheek crimson beneath his gaze, 'I thought—that is—from the way the names were in the paper, we were all sure that it was your wife!'

He did not laugh, but looked at me with a curious kind of serio-comic expression in his face, and crossing over to the sofa, seated himself beside me, and began to examine the tangled and ravelled remains of my poor mother's crochet.

'So you thought I was married, Miss Nathalie,' he said at length; 'you were wrong, but I hope soon to be!'

'Is that so?' I asked, bending still lower over my imaginary work.

'I said I hoped, for it entirely depends on you!'

'On me!' I involuntarily murmured.

'Yes, on you,' he repeated, in a voice of deep emotion. 'I ought not—I did not mean to ask you to-night, but I have waited long weary months, and I must speak now. O Nathalie! you little knew how bitter that parting was to me—how I yearned to take you in my arms, and tell you all you were to me; and when I fancied I saw your sweet lips quiver, my firmness nearly failed me. Dear Nathalie,' he continued, in low pleading tones, while he took my unresisting hands in his, 'will you trust yourself to me?—will you now give me the right to take you to the heart so truly yours?'

Mine was too full to speak, and glad tears stood in my eyes; I raised them to his, and he read his answer there.

'At last!' he exclaimed joyously, as he put his arm around me, and gently drew me close to his side; 'my own precious little girl!'

With a sense of unutterable rest and peace, I laid my weary head on his breast; and for some moments we were silent in the intensity of our happiness.

Then, in the deepening dusk, he told me how he had longed for this hour, yet felt that for him it could never come while his helpless father lived; nor would he enter upon any engagement with such indefinite hopes for the future. 'Poor old man!' he said; 'he died just three months ago, with his last breath committing to me, as a sacred charge, the care of his wife and daughter. A most opportune legacy has placed them above all need;

and my sister, who is at present on a visit with some friends in England, will shortly rejoin my mother in Brooklyn, where they purpose to reside.'

All this, and much more, we talked of, as we sat together that blessed evening, forgetful of all else, until a ring at the door announced the return of my parents, who had delayed to visit a friend. There was little need of explanation. Roy's proud radiant face and my happy blushes told the whole story; and never was son-in-law more heartily welcomed than Roy Percival.

The next day he took me to see his mother—a dear old lady, who received me with all a mother's affection; and, as he prophesied, Mrs Howard and Mrs Percival became great cronies. About three months afterwards, we had a very quiet wedding; no fuss nor formality, and only our dearest and most intimate friends to wish us 'God-speed' on our way. We went home at once to our own cunning little house, which we had spent many a happy hour furnishing and fixing to our taste. Mrs Percival boarded at some little distance. Under the same roof with us she would not remain—although we urged her to do so, at least till her daughter arrived.

'No, my dear children,' she said; 'when young birds can do for themselves, the parent bird leaves them to themselves; forbid that I should transgress one of the wisest laws of nature!'

Before concluding, I may as well mention that, about a year later, a paragraph might have been seen in the *New York Times*, to the effect that a certain Mr Harry Stanwood and a Miss Florence Percival had seen fit to enter upon married life.

A word more, and I have done. Among my wedding-presents was one which I dearly prized. It was a beautiful painting by an eminent American artist, and hangs in the most honoured place in my parlour, a delightful reminder of the spot where first I saw my Friend of the Thousand Islands.

CHANGES IN LAND AND WATER.

It is a fact not generally considered, that the surface of the globe is continually undergoing change. Materials washed from dry land are daily hurrying down rivers into the sea, and the sea, while filling up at one place, is encroaching on the land at others. There is a class of phenomena less observable, but equally tending to change. One continent or island is slowly rising, increasing the height of the cliffs, and laying bare a strip of beach previously covered with water; while another is slowly sinking, causing strips of shore to disappear beneath the waves, and lessening the apparent height of cliffs and headlands. What is the nature of the vast internal forces that bring about these changes—whether condensed bodies of air, pent-up subterranean reservoirs of water, gaseous expansions and contractions, or volcanic chemical reactions beneath the earth's crust—science may possibly one day tell us; at present the materials have not been collected for so doing. The rapidity of the changes varies quite as much as their nature. In some localities, men in the middle or later years of life can

remember that the coast-line in their early days was farther out or farther in than it is now; in others, a whole century has been necessary to render the change measurable or even appreciable; while in others the change may have been in progress for thousands of years, for aught we can tell.

The *deltas* of mighty rivers, both in the Old and the New continents, exhibit in a striking manner the kind of action last adverted to—the growth of land by the deposition of mud, silt, and sand. The beautiful Lake of Geneva, upwards of forty miles long, is gradually filling up. The Rhone enters the eastern end of the lake, bringing so much mud and silt from the Alps as to render the water quite turbid; it quits the lake at the western end with the water clear and beautiful. Nearly all the mud has been deposited in the lake itself. As a consequence, the lake is becoming shallower, and strips of dry land are gradually forming at the margin. The old town of Port Vallais was once at the water's edge; it is now nearly two miles inland, the intervening strip having changed its character from sea to fertile land. By the time the same river Rhone reaches the Mediterranean, it has collected a new cargo of silt and sand, which it deposits at the mouth, and is there forming a delta of alluvial soil. What were once the small islands of Mese and Psalmodi are now joined to the mainland by strips of this sediment; and a tower on the coast a century and a half ago, is now a mile or more inland. The Adriatic Sea, eastward of Italy, is gradually being choked up at the northern end by river-silt, mostly brought down by the Po. Adria, Ravenna, Spina, were all sea-side towns when first built; they are now from four miles to twenty miles inland. The ancient hot-baths of Monfalcone were once on an island; the island has long since been connected with the mainland by a grassy plain. The northern parts of Europe exhibit similar phenomena. For instance, the whole of Holland may in one sense be regarded as the delta of the Rhine, formed of the sediment brought down and deposited by that river during countless ages. The Gulf of Bothnia is gradually becoming shallower, and strips of newly formed dry land are appearing; partly from silt deposit, partly (it is surmised) from a slow rising of the earth's crust in that part of Europe.

But what are European rivers compared with those of Asia? The mighty Ganges, during its long and winding course from the Himalaya, brings down enormous quantities of solid matter, which it deposits at its mouth in the Bay of Bengal. Here has been formed a delta called the *Sunderbunds*, once clear open sea, now a wilderness tenanted by tigers and alligators, and permeated by numerous 'mouths of the Ganges.' In round numbers, the dry land has robbed the sea of some two hundred miles' width of margin. The Indus, in like manner, though in smaller degree, is robbing the sea, by forming a delta at its estuary or cluster of mouths. Mud is generally interpreted by us simply as an annoyance, not as a heavy substance; but the weight of mud brought down by some of the great rivers is almost inconceivably great. A calculation has been made, that in a hundred and twenty-two days of the rainy season, the Ganges brings down *six thousand million cubic feet* of earthy matter! Sir Charles Lyell points out that

this would more than equal, in bulk if not in weight, forty of the greatest pyramids of Egypt.

The Athara, a tributary of the Nile, the sources of which appear to be farther and farther away the more our explorers search for them, has formed the fertile Delta of Egypt by bringing down enormous quantities of silt from Abyssinia. It is believed that the Mediterranean once washed the very base of Memphis itself; how far that spot is now from the great sea any map of Egypt will tell us. The whole bed of the lower Nile is being raised by the deposit of millions upon millions of tons of mud after every rainy season. In America, the Mississippi is telling a similar tale.

Many patches of dry land on our own shores are gradually being formed by the subsidence of river-mud, by the deposit of shingle brought by tides and currents, and by slow elevating of the land itself. In the townland of Musselburgh, near Edinburgh, a tract of four hundred acres has, in the course of centuries, been stolen from the Firth of Forth. The Esk brings down a quantity of silt; this, checked by the tide of the Firth of Forth, is deposited on the beach, where, meeting with boulders and shingle, it gradually forms solid ground; and on this ground, once covered with sea-water, the greater part of the town stands. Along the coast of Norfolk are many sandy tracts stolen from the sea, chiefly by the deposit of loose sand across the mouths of rivers, the carrying agent being the tides and currents of the German Ocean. The Wash is gradually silting up in a different way. The rivers Nene, Welland, Witham, and Ouse pour into this wide estuary vast quantities of soil brought down from the neighbouring counties, and deposit it all round the margin. As a consequence, the Wash is becoming shallower and shallower; the bed is being elevated; the outlets of the rivers are nearly choked with mud at low tide; while at high tide, the fertile lands of the interior are in danger of being flooded with a rush of sea-water. Millions of money have been spent in deepening the channels of the rivers, making new cuts to facilitate the outflow, and embanking the silted-up margins of shore. Norfolk, Cambridgeshire, and Lincolnshire have been well rewarded for the outlay by the fertilisation of long stretches of newly consolidated land, formerly covered by the sea. Patches of dry land have been formed in a similar way on some parts of the coast of Kent. Winchelsea, Rye, and Sandwich were at one time seaport towns; they have now only a faint claim to that title. In some places the sickle and the scythe are seen at work where not long ago was salt sea; at others, the margin can scarcely thus be utilised. Poor Sandwich looks dismally at the wide expanse of mud that fronts the town twice every day when the tide is out; the mud is neither useful nor ornamental; vessels cannot sail through it, nor can crops be cultivated on it.

According to law in the British Islands, the strip of muddy or shingly beach between high-water mark and low-water mark, called the *foreshore*, belongs to Queen Victoria, or to the sovereign for the time being; as also the bed of the sea for a few miles out. So long as these strips are useless, nobody cares about them; but if ever they become dry land, the sovereign claims them. In bygone centuries, many such have been granted away by charter to corporate bodies and lords of manors. The foreshore of Cornwall has in this way been

granted to the Duchy of Cornwall. A few years ago, a curious suit was tried—the Queen *versus* her own son—the sovereign against the Prince of Wales as Duke of Cornwall. Of course, the two august personages had very little to do with the matter; the land commissioners on the one side found it necessary to come to some agreement with those on the other, as to certain doubtful matters of grants and claims. When any reclamation from the sea takes place in spots unquestionably regarded as royal foreshore, an easy money payment, as premium or rental, settles the matter of occupancy.

A counterbalancing loss, however, is going on. As we have observed, if the land robs the sea in one part, the sea robs the land in another. This is familiarly exemplified by the rubbing and grinding away of coasts and cliffs, especially on the eastern shores, by tides and currents. There is a reason for this which we seldom think about. When tides and currents roll in from the Atlantic, the British Islands act as a kind of cutwater, splitting the stream into two parts. One body of water flows in between England and France; then, turning northward, flows up the German Ocean towards the North Sea. The other body leaves the shores of Ireland, the west coast of Scotland, the Hebrides, the Orkneys, and the Shetlands, and then turns down into the North Sea, between Britain on the one side, Norway and Denmark on the other. What is the consequence? Tide meets tide, current meets current; and the coasts suffer in the *mêlée*.

Travellers who have visited the Shetland Islands tell us that the bold cliffs are worn and torn and riven in an extraordinary way. Sir Charles Lyell describes the cliffs as being hollowed into deep caves and lofty arches; headlands and promontories assume the fantastic forms of columns, pinnacles, turrets, and obelisks; huge blocks have been driven hundreds of feet away; and the sea has forced a passage through rocks of the hardest porphyry.

Coming south, to the eastern coast of the Scottish mainland, it is found that the destructive force of the waters is less violent. Where is the old town of Findhorn, in Morayshire? Gone; the sea has ground it away, and then swallowed it. In a similar way has disappeared the village of Muthers, in Kincardineshire. Bending round, past Peterhead and Aberdeen, we find evidences that, near Arbroath, gardens and houses have gradually been submerged. The first lighthouse at the mouth of the Tay was built on a portion of coast which is now quite under water. On the opposite coast of Fife, at St Andrews, the sea is gradually claiming the land; Cardinal Beaton's Castle overhangs the cliff in some places, and must in time resign its stately proportions to the sea; while similar marine encroachments are evident all the way along to Fife Ness. The same may be said of Tantallon Castle, on the coast of Haddingtonshire, whose base the restless tide is gradually undermining. The shore between Newhaven and Leith, near Edinburgh, was until quite recently, considerably broader than it is now; and but for strong bulwarks which were laid just in time, the houses which now overlook the Firth of Forth, must have been undermined and washed away. As it is, the roadway of twenty years ago no longer exists.

The northern counties of England have had to

pass through some such ordeal as their Scottish neighbours; the sea has swallowed down more than it has given up, so far as concerns dry land. On the Northumberland coast, Bamborough has been shorn of much of its original proportions; while Tynemouth Castle, now on the very brink of the sea, had at one time a good stretch of fertile land between it and salt water. The Durham coast, especially about Hartlepool, tells many a similar tale to those who are able to read it aright. Yorkshire has suffered much more decidedly. Where there are cliffs of chalk, such as at Flamborough Head, caves have been scooped out by the waves, and portions of cliff isolated into fantastic needle and obelisk forms. Where the cliff or beach is lower, and composed of a mixture of chalk rubble, clay, gravel, and sand, the destruction has been more marked. We would look in vain for the old Yorkshire seaside towns or villages of Auburn, Hartburn, and Hyde; they are gone, buried beneath the waters. Hornsea, too, with Othwaite and Kilnsea, are gradually undergoing the same pitiless fate; middle-aged men can remember when the coast-line was farther out than it is now, while old men shake their heads at the amount of destruction they have witnessed. Sir George Head, describing what met his view at Holderness (as this part of the Yorkshire coast is called) says, concerning Kilnsea: 'I thought I had never seen human dwellings so critically placed; the houses huddled together on a bleak, bare spot, unrelieved by surrounding objects—a low promontory on a crumbling foundation, against which the waves continually beat with a heavy swell. Indeed, the imagination can hardly depict a more abrupt and daring position. Before entering the village, and immediately contiguous, the road leading to it at one particular part had already gone; while, in a line diverging from the chasms, rails were set up to direct the course of the night-traveller, and to prevent him from walking on straightforward into the sea. . . . Notwithstanding, hitherto such has been the apathy of the villagers, that many rested quietly for weeks together with the spray of the sea-storm rattling against their windows; and thus have remained till the ground has been almost torn from under their beds.'

In Lincolnshire, owing to the extreme flatness of the coast, and the level of many parts of the interior being below that of high-water, the sea has more frequently inundated the land than worn away cliffs; man has battled against it, not by removing houses and villages farther inland, but by raising seaside embankments. But, in Norfolk, the cliff-wearing has been in progress for an unknown number of centuries. The cliffs at Hunstanton are being eaten away yard by yard. An inn at Sheringham, built at what was believed to be a safe distance inland, is now close to the edge. The small pleasure-town of Cromer is *new* Cromer; the old town is now beneath the waves, and the new one seems likely to share the same fate by and by. Reculver is now represented only by the tower of the ruined church; all else is gone, as are the (once) seaside villages of Wimpwell and Shipden. Suffolk is no better off than its neighbour Norfolk. Dunwich has been travelling inland ever since it was Dunwich; new houses, churches, and public buildings having been erected farther back, as the old ones were washed away. Corton,

Aldbrough, Pakefield, and Bawdsey have similarly been disturbed in their quietude.

Coming down to Kent, we find Reculver now represented by a ruined old church, washed at its base by the sea; Horne Bay, once really a bay, now scraped away to a straight line; the North Foreland dug into by the waves; the cliffs at Dover, Folkstone, and Hythe similarly worn; so are Hastings cliffs and Beachy Head. All along the coasts of Hants and Dorset the sea is robbing the land; especially near Lyme Regis, where the waves have wrought changes almost whimsical in their strangeness.

On the southern side of the Isle of Wight, facing the British Channel, sad havoc has been made by the encroachment of the sea. The cliffs being undermined by the tides, large masses have fallen down, and landslips of a picturesque kind produced. Some years ago, when at Ventnor, we observed with some concern that the tendency to destruction was greatly promoted by the mischievous practice of removing sand from the shingly beach, for building purposes. The sand which Nature threw up as a protection from the violence of the waves was systematically carted away. In the local press, we took the liberty of pointing out the danger of so damaging the beach, but without avail. At length, the authorities got a tremendous awaking from their lethargy. A heavy storm beating on the shore destroyed portions of the Promenade, and threatened the very foundations of the town. Alarmed for the consequences, the robbery of sand was stopped, but too late to preserve the original beauty of the beach. On a late occasion, when visiting the spot, it was distressing to see that the shore in front of the town was defaced by rows of stakes driven into the shingle for the purpose of averting any further injury. At much cost the town was saved, but a thing of beauty had from pure greed been sacrificed—a lesson to civic authorities who tamper with what Nature sends as a protection to a foreshore.

Lessons of this kind, however, are perhaps not always either agreeable or acceptable, particularly if it should occur that the parties who are expected to protect the beach from depredation are themselves the depredators, or are at all events lax in their guardianship. The old question arises—'Who are to keep the keepers?' Whoever be to blame, a great and it may be an irreparable error is committed when, possibly from sheer thoughtlessness, sand is removed from places where, besides being an attraction, it happens to serve as a bulwark against the violence of winds and tides. A scandalous case of sand-removal from a sea-shore has lately come under notice in connection with Portobello, a pleasant watering-place on the Firth of Forth near Edinburgh. The most magnificent sweep of sands, as far as we know, in Scotland, was in a wholesale manner made a habitual prey, and carted off without practical restriction, until, roused by the effects of a storm, the inhabitants got alarmed, and the spoliation was stopped. The mentioning of these cases may possibly be useful in drawing general attention to the subject. Where seaside residents are favoured with a fine beach, they cannot, as we think, be too vigilant in its preservation.

HOME FLOWERS.

No one who is observant of his surroundings in a walk through any great town or city in the United Kingdom can fail to recognise the great increase in the cultivation of flowers, and the adornment of the exterior of houses with devices and arrangements in which shrubs and plants of every description are the prominent features. Those who can recall the condition of things twenty or thirty years ago, tell us of the dull, cheerless aspect of our streets, and the impossibility of seeing a growing leaf in our great cities, save in the conservatories of the wealthy, or the few trees that escaped the axe of the destroyer when some of the squares and streets of cities were formed by the builder. The natural yearning for something green to look upon—for some faint shadow of the lovely buds and flowers which the tired workers in our smoke-darkened atmospheres seldom see—suggested long ago the possibility of protecting these charming children of Nature from the uncongenial surroundings of towns and cities, by placing them in glass cases; and in Wellese Square, close to Smithfield Market, at the top of his house there, an enthusiastic medical practitioner succeeded in growing the denizens of distant lands in beautiful perfection; there he cultivated small palms, cacti, ferns, and exquisite little mosses, as well as tiny roses, heaths, and other flowering-plants. This was the beginning of the now common practice of growing plants in small glass inclosures without the admission of air; and cases so adapted are called Wardian Cases, from the name of their inventor, Mr Nathaniel Ward, the doctor who so loved Nature, that his greatest pleasure and relaxation was to tend and develop her efforts to grow and multiply under the disadvantages of a London atmosphere.

Now that these Cases are so universal, and window-gardens inclosed in glass are by no means uncommon, we almost fancy it was always so; and we do not realise what a source of pleasure would be removed from our daily life if suddenly we were deprived of the many appliances which now

make town-life so much more tolerable, even to the lover of the country, than it used to be. Window-gardens are of so many different kinds, of such various pretensions, that it is difficult to prescribe any one form of arrangement. We know one house in the heart of fashionable but smoky London, inhabited by a skilful dentist, who has the excellent taste so to arrange every window on which the patient, while seated, must gaze, as to be a perfect delight; and we know from experience, that the minutes, or maybe half-hours of discomfort—not to use a stronger term—spent in his terrible chair, are strangely beguiled by the bright and beautiful buds and leaves tastefully arranged in a rock-work kind of setting, and which seem to peep in at you through the window as you bear your tortures, suggesting scenes and days when toothache and all its complications shall have passed away. In the particular house of which I write, each window is filled with a sort of deep zinc tray, supported on the outside by a broad window-sill and iron brackets. It is covered over with glass, which reaches about three feet from the bottom of the window; the inner glass being formed by the window itself, which is left to open and shut easily. A simple sort of rock-work, made either of stones or virgin cork, forms the background; a mossy bed lines the bottom of the zinc tray, which is drained by means of a little trough at the side. In this lining, my dentist friend has planted delicate trailing ivy, bright and tender ferns; and as the seasons change, the scene is varied by the many kinds of cryptogamic plants he finds in his winter walks, or induces his lady-friends to collect for him—the pretty red-cupped lichen, curious mosses and fungi, an early crocus or two; then the lovely primrose, the wood-anemone, and any one or two of the most easily obtained wild-plants of the district within reach. We almost wonder what new floral genus will be in the well-known window to welcome us, when next we take our seat in that inevitable green-velvet chair.

Such pleasure as these simple arrangements afford, is within the reach of every one who loves the beautiful green world well enough to give

a few minutes' attention daily to it; and the variation of the inhabitants of these little window-cases would often form an agreeable object for an excursion into the country, more enticing than the mere exercise of walking. When expense in construction and furnishing is not an object, these window-cases may be made to contain many rare and choice plants; and a simple arrangement for heating them by means of hot-water pipes can easily be effected, and the water kept hot by the use of gas outside. It is quite right that these more ambitious constructions should be attempted and enjoyed by those who can afford them; but the real pleasure of contriving and filling a simple window-case is known best to those who have done it for themselves, to whom every little ivy leaf or fern frond is a familiar friend, and who can associate the remembrance of a pleasant chat, a health-giving breeze, or a thoughtful solitary stroll, with this little clump of moss, or with that little cluster of harebells.

Many an invalid, confined to one room perhaps, and debarred from ever seeing Nature in all her beauty, may derive intense pleasure from these simple contrivances. The dampness necessary to the growth of the plants is shut out from the room by the closed window; and when sunlight shines in, and this window is thrown open, with what joy will the delicate and wasted fingers arrange and tenderly care for the cherished leaves and buds within, seeming to pet them almost as though they had the consciousness to welcome the attention! No companionship is more grateful to an invalid than that of quiet, gentle, unobtrusive nature as seen in the life of plants; and by this device of a window-case outside the room, and yet visible through the window, the conditions of light and moisture necessary to the plant are combined with the possibility of preventing the evil effects of strong perfume or dampness on the inhabitant of the chamber. Were it only that we are now able to enliven and cheer the monotonous existence of the afflicted ones of the world by the sight of living, growing, healthy, and beautiful vegetation in their very chambers, our debt of gratitude to the inventor of these Cases ought to be very great indeed.

In a book before us—*Domestic Floriculture*, by F. W. Burbidge (William Blackwood and Sons)—there are full directions for all kinds of gardening, and for the cultivation of flowers in all possible circumstances; it also contains suggestions from practical experience as to the best plants for each special condition. Mr Burbidge tells us much about the cultivation of plants, the soil and treatment best adapted to each; he also gives excellent and practical hints as to the use of flowers in ornamental decorations in the house, on the table, and about ourselves; and concludes by a long and descriptive list of plants, implements, &c. requisite for every kind of gardening.

But few people, we fancy, exist who do not feel gratified by the presence of bright growing-

plants in their houses; and yet the difficulty of preserving them, and the expense of renewing them, are often serious drawbacks to this pleasure. One of the most fertile causes of disappointment is due to a bad selection of plants; for it is not every plant that will grow either in a window-case or in a room. Another serious interference is the use of gas in rooms where the plants are placed; the slightest escape is sufficient to cause the leaves to wither and fall off, and generally to injure the plant. The better the room is ventilated, the more successful will be the plants in it; and this observation ought surely to teach us a lesson with regard to ourselves and our own health. Though not so sensitive to impure air as our vegetable companions, we are undoubtedly not sufficiently alive to the depressing and injurious influence of an ill-ventilated and polluted atmosphere. Syringing the leaves of plants exposed to the dust of a sitting-room, and washing them carefully with tepid water, assist them to live.

The result of some experience, many disappointments, and much vexation, as to the plants which live longest and best in the atmosphere of a town-house where there is no conservatory to recruit them, is, that pelargoniums, fuchsias, and the whole race of gardeners' greenhouse favourites, are a delusion and a snare, and should only be indulged in with the knowledge that their beauty is but transient, and that they will soon perish. Ferns, grasses, agaves, the *Ficus elastica* or India-rubber Plant; the Umbrella Sedge (*Cyperus alternifolius*) from Madagascar, and some of the *Dracenas*, are more lasting and more satisfactory as indoor plants than any others we have tried. It is difficult to say why this is so; possibly owing to the larger amount of breathing-surface in the leaf possessed by these plants, it being of course essential to keep this respiratory system free from dirt and dust, and able to act freely.

Those who possess conservatories as nurseries for their plants need not be so particular as to their endurance, for on the least sign of sickness they can be removed and exchanged; it is chiefly in those who, like ourselves, have neither greenhouse nor conservatory, and no money to throw away, that we feel interested, and would help to enjoy the luxury of tastefully decorated rooms and the companionship of beautiful plants, without the drawback of extravagance.

For several years we have managed to keep a little sitting-room the object of admiration and envy of our friends, by a little contrivance in its arrangement. During the summer, when there is no fire required, the open fireplace is filled by a frame of wicker-work, which exactly fits it, and is fastened to a trough or *jardinière* of galvanised tin about ten inches deep, in front. This is painted green, and the fender is removed and put aside. Two pots of growing ivy are set in this trough, one at each side, and the branches are carefully trained over the wicker-work, so as to form a green and living screen. The register (damper) of the chimney is left open behind this screen, so as to secure ventilation to the room and the plants. The trough is then filled in with hardy ferns, or such plants as are

found to survive longest, and the pots covered over with moss. They can thus be easily and safely watered, and will live in a London room without any appearance of fading for three months of the summer. Dead leaves must of course be picked off, and attention paid to the plants generally; but they will repay it all by growing and thriving; and if the fireplace be not in a dark part of the room, the ivy flourishes luxuriantly. This arrangement costs but a few shillings, and will last for many years. It has also a decided superiority over cut paper-screens. With the wicker-screen and ivy in front, the fire materials may remain laid in the grate, ready for a chance cold or wet evening. When the fire is to be lighted, the floral screen can be lifted and placed in any part of the room against a wall, with the ferns and flowers in front as they were.

All decoration is so much a matter of taste that it is difficult to prescribe rules for it; but a few practical hints are often valuable to those who have sufficient ability to carry them out, though not to originate them. In Mr Burbidge's book is a very pretty drawing of a mirror draped with ivy, which is kept alive by a little tin receptacle for water hung on a nail in the wall at the back. The same suggestion is applicable to a picture-frame; and surely the portrait of a beloved face gone from us, perhaps for ever, around which fresh green leaves and tender flowers are allowed to cluster, harmonises well with the feelings which arise as we look on the well-known features!

Another plan is to have a little trough suspended in front of the picture, which can be filled with moss and flowers according to the season; and we fancy that, of all places in the house, this will be the chosen one for the earliest spring flowers and the brightest blossoms throughout the year—a loving task for the hands that can no longer minister to the pleasure and comfort of the dear one whose likeness is so precious, even if it be but a photograph. It is a very convenient and tasteful contrivance to fill a soup-plate or dinner-basket with moss, which can be kept well moistened, and in which any wild-flowers or pretty buds or leaves gathered in a country walk can be placed. Here a few wood-anemones, a dozen primroses, a twig overgrown with a curious lichen, or a fungus with an unknown name, may be grouped so as to remind one of the lanes and hedgerows whence they came.

Surely one great delight in surrounding one's self with flowers is that of association; certainly it is so with wild-flowers; their beauty is not their only attraction, but the renewal of life they seem to bring with them. There they are, the same as when we were young; the tiny harebell, with its pale-blue cups and cobweb stems, is just as it was in the days when we fancied we could hear the silver music they made when the good fairies

Rang their wildering chimes to vagrant butterflies!

Even the bright and common buttercup recalls the joy of a summer holiday in the fields, and we find ourselves, with gray streaks in our hair, laughing once again over the recollection of being convicted of fondness for 'butter,' and blowing the silver down off the stem of the dandelion to see 'what o'clock it is.' No gardener's art has changed these lovely children of nature; they are like the early and true friends of youth, untouched by the hand

of Fashion, and telling only of simple love and purity; just as they were half a century ago, when life was so bright in anticipation, and we only knew that flowers were beautiful, and that we loved them.

The practice of growing flowers in the windows of cottages is a very ancient one, and we read of the campanula being a favourite window-plant as long ago as the time of old Gerard the botanist. Window-gardening has now spread from the humble cottage to the largest mansion, and we cannot pass through a square or street in London, or any of our great cities, without seeing balconies covered with bright green leaves, and growing-plants and flowers garnishing many windows. From many a dark and gloomy area may now be seen ascending healthy and bright creeping-plants, such as the Virginian creeper, jasmine, or ivy. These cover the soot-begrimed walls, and cheer the eyes of those who seldom leave the lower rooms of the house; and if the roots and lower branches be well cared for, they grow on higher and higher, till they cover the bare house-front, peep into the dining-room windows, and carry freshness and adornment from Betty's humble domain below, up to the threshold of beauty and fashion. This custom of surrounding the house with growing-plants is common on the continent. In France and Germany, many of the houses are adorned by one or two beautiful oleanders in large painted tubs on each side of the entrance, and possibly several aloes or other hardy plants arranged on the door-steps. In our crowded city streets, space is too valuable to allow of this sort of decoration, and we are generally obliged to confine ourselves to boxes filled with mould and placed on the window-sills outside. These may be filled with a succession of flowers as the seasons advance, and require only the attention of watering and removing the dead leaves or flowers as they appear. When the atmosphere is densely thick and dirty, the protection of a little glass case is of course very desirable.

In all window-boxes it is very desirable to mix the fresh green foliage of small shrubs with the bright flowers of what are called 'bedding-plants.' It is a mistake to fill the box with a multiplicity of colours and shades mixed indiscriminately. It is better to use a few distinct flowers, and to arrange the colours in tolerable masses.

Many people still hold by an old prejudice against having plants in such rooms as are constantly used or slept in; but, as is the case with most prejudices, no reason is given for their objection. It is thought to be unhealthy; and if we take the trouble to analyse the objection, we find perhaps that strong perfumes are disagreeable, which is quite possible, and should therefore be avoided. The objection to cut flowers may arise from the fact that the stems often decay and decompose in the water, if neglected, especially such flowers as wall-flowers, hyacinths, bluebells, and the like, with succulent and leafy stems. No room is so bright and pretty as it might be without a few nicely arranged flowers disposed about it, and no table can be said to be complete without a glass containing a single flower, if no more.

As it is with individuals, so it is with nations, we are inclined to think—the love of nature, and the study of her ways and laws, increase as civilisation advances. Balcony and window gardening,

and the companionship of beautiful flowers, are delightful and refreshing, and in some degree are open to every one to enjoy; but it will readily be believed that some acquaintance with the real nature and habits and constitution of the things we so much admire must add to their interest. The germination and growth of a seed is a subject for study and thought. The examination of the various phenomena which take place even in a window-box of plants, must suggest many questions to the thoughtful mind. Here is a green leaf. Why is it green? Why does it turn yellow? How is it that a plant only lives in the light? How does it use the air that we breathe? It retains in its tissues the carbon, and returns oxygen for our use. It is, then, a purifier and health-giver, and performs in its little sphere the same functions as those of the noble oak in the forest which has defied the blasts of centuries.

The subject of domestic floriculture is full of interest for all who aspire to elevated pursuits. The pleasure of planting some tiny seed is only equalled, if it is not excelled, by watching its early peep-of-day and daily progress thereafter: be it hyacinth, or crocus, or snowdrop enshrouded in their narrow earthen bed, the first suspicion of green that breaks the superincumbent earth, brings to the expectant owner a *something* difficult to express. Nor need he be overburdened with this world's gear, for many a working-man has been a true student of nature, and has found happiness and pleasure unknown to those of baser tastes.

FALLEN FORTUNES.

CHAPTER XX.—DALTON TAKES THE BIT BETWEEN HIS TEETH.

THERE were now but two or three days remaining to be spent at Riverside; the Daltons had been there for some time, but Holt had come towards the end of their stay, and was to return to London in their company. It was a strong proof of the popularity of the former that they were importuned to make a longer visit, notwithstanding that such an arrangement would have involved keeping Mr Holt, who had already over-stayed his welcome. There was nothing about him even negatively offensive—such as is seen in the tone, or look, or manner of many men; but he had not succeeded in ingratiating himself with any one of the party. The man who disliked him most was undoubtedly he who had been the cause of his admission into the Riverside circle—namely, John Dalton himself; yet he now sought his companionship more than ever, and more than that of his own belongings. He was the only one in the house, save Edith, who could appreciate—even if he did not sympathise with—his miserable position; and with Edith, conversation was too painful. And Holt, on his part, feeling perhaps somewhat *de trop* in the company of the rest, or perhaps for more substantial reasons, was glad enough of his company. Of Dalton's conversation—once so brilliant and so fluent, even with a companion such as he—he did not get much; the two men sat opposite to one another for hours together in the morning with their cigars, dropping a remark not much

more frequently than they dropped the long ashes of their intimidada.

'By-the-bye,' said Holt on the morning after the event recorded in our last chapter, 'this dreadful *Lara* business has swallowed up all other affairs, like an Aaron's rod, or I should not have omitted to tell you that poor Astor has left us.'

'Left you? I suppose you mean that he has had his *congé*. Poor Philip! The family, it seems, are coming to grief all round. Perhaps, if he had won his cause, he would not have kicked down the whole property, as I have done.'

'Well, he squandered whatever he could get, you know.'

'That's true,' answered Dalton indifferently. He had always felt much sympathy for his half-brother, besides exhibiting it in a more practical way; but his own circumstances were too desperate to admit of much feeling for him now. 'I am afraid he is an impracticable fellow. I believe I did all I could for him *when* I could,' and Dalton sighed to think how incapable he had become of helping even himself.

'Impracticable; yes, that is just the word. I found it was quite impossible to get on with him any longer. I bore with him more than I could have done for any other man, for your sake.'

'I daresay,' said Dalton coolly, and not with much graciousness, that must be owned. 'And where is the poor fellow gone to now?'

'I cannot tell. There was no absolute quarrel between us, you understand, but we did not part on such good terms that there was any confidence. I believe, however, he has gone abroad—to seek his fortune; rather a vague phrase with anybody, but in the case of such a rolling-stone as Astor'—and Mr Holt executed his favourite continental shrug.

'If I was a free man, and if I could leave my wife and children with enough to live upon in comfort, that is what I would do myself,' said Dalton thoughtfully.

'What would you do?'

'Go abroad and seek my fortune; and when I say "abroad," I mean across the world, and as much as possible out of it. I would fly from Civilisation, Luxury, Society'—

He stopped, suddenly conscious that he had a listener—a very earnest and attentive one, with a look upon his face that seemed to ill conceal something of satisfaction, if not of downright triumph.

'What the deuce is there to grin at?' asked Dalton savagely.

'I was not grinning at all, my good sir,' answered the other. 'I was, on the contrary, deploring within myself the cruel mischance that had brought a man like you, the pet of the bower and the hall—how does it go! to wish yourself out of society. You wouldn't like to become a savage, surely, to have only two coats—of paint—one for peace and one for war.'

'I shall not long possess two coats of any other kind,' said Dalton bitterly.

'Oh, come, come; there you exaggerate.'

'I am stating the simple fact, and you know it, Holt. Supposing that mine turns out as worthless as we believe it to be, I shall, literally, not have a coat to my back.'

'A bad mine is a deuceful bad hole to get into, no doubt; but still, there are ways out of it.'

'Not honest ways,' answered Dalton sternly; 'you know we have exhausted that subject.'

'Yes; but we were talking then of your slipping your head out of the collar. Now, supposing you got somebody else to take the shares upon his own shoulders. Of course, you would get nothing for them, but it would at least limit your responsibilities.'

'But who on earth would be such a fool as to take shares in the *Lara*, now?'

'Well, there are always speculators,' answered the other coolly 'not fools, by any means, but men who will take some risk upon themselves, where the expenditure in the first instance is little or nothing.'

'Have you a friend in the City who wants *Laras*?' inquired Dalton with a forced laugh. The words of warning in the letter of the previous day, 'Stick to the *Lara*,' rang in his ears. Was it really possible that the man who had pronounced the mine to be hopeless, and likely to prove worse than hopeless, ruinous, was desirous to obtain shares in it? The suspicions that he had of late entertained of Holt, recurred to his mind with terrible violence; he had no more ground for them than before, unless that single line of anonymous advice could be so termed; yet he felt convinced, as he had never been before. 'Have you a friend in the City who wants *Laras*?' was, he was aware, a question which, under the circumstances, involved an insult; yet he had not hesitated to put it.

'You are not serious, I am sure, Dalton,' said the other quietly; 'if, at least, you mean by that, do I want *Laras*. The mine is, in my opinion, a mere dangerous hole. At the same time, I believe I know people, or can find them, who think otherwise; who are confident that they can avoid the danger, and have hopes of getting something out of the hole. They are rash, no doubt, but they are accustomed to risks; and if they choose to take this particular one instead of you, that is their own affair. You surely need have no scruples in this case.'

'They are not scruples, but doubts'—

'Doubts, Dalton?' interrupted the other quickly. 'Doubts of whom?'

'Well, I cannot say of whom, because there may be a lot of people mixed up in the affair, and I don't happen to know their names. You were good enough to say, the other day, that you would hold me harmless—out of old acquaintance' sake—from further liability as to the *Lara*; and here, it seems, are others, who have no such acquaintance with me, offering to do me the like favour. Under these circumstances—moved by so singular a coincidence—I think I shall stick to the *Lara*.'

'You will do as you please, of course, my dear Dalton; but the question is whether you can afford to stick to it. That every shilling will have to be paid up, is morally certain.'

'I can pay every shilling.'

'My dear fellow, there is no occasion to be so brusque; I do not doubt that you can pay it. But when you were so good as to repose some confidence in me the other day respecting your affairs, it was made plain to me that the payment would leave you without much margin as to means.'

'You need not be so delicate about it, my good

sir,' laughed Dalton bitterly; 'it will leave me penniless.'

'Not quite that, I hope, Dalton.'

'Quite that, Holt. Whatever remnant may be left, I shall set apart for my wife and children, and only taking for myself so much as will pay my passage out, and keep me for a few weeks, when I have landed, I mean to go abroad, like Philip, and seek my fortune. It is, as you have said, a vague term; but it is at all events better than staying here and cutting my throat. It is out of the question that I should remain at home and be a burden to my dear ones—for a moment his lips trembled, his voice failed; then, as if ashamed of his own weakness, he added sharply 'and therefore I mean to go abroad.'

'But surely not without an aim?'

'I did not say that,' answered Dalton coldly.

'My dear fellow, I am the last person to be inquisitive, or to press for confidence which is withheld from me; I was only about to observe, that the difficulties which even you may experience in getting a home appointment of any value, would disappear if you could be content with a place abroad. There is not the same importunity for them, and at the same time they are in many respects more advantageous. There is many a consulship, for example, at places to which one would scarcely like to bring one's wife and family, where, nevertheless, a man might find himself very comfortable *en garçon*, and make—or rather save—a good deal of money.'

'I daresay,' answered Dalton with indifference. He had hardly heard what the other said. The intention which he had just expressed of leaving England, had seized him upon a sudden—while Holt was talking to him, and had been in part suggested by his talk; and though he was quite resolved to put it into execution, the magnitude of the matter overwhelmed him. It was only with a small part of the world that he was now concerned; it did indeed consist of but four persons; those always loved ones were dearer to him now, than when the rest of the world had been something to him: they were his all-in-all, and now he must needs part from them—perhaps for ever. It was curious that when he had been cutting himself off from them (as he thought) *with certainty*, he had been less moved; but then he had known, or had persuaded himself, that it was for their own good; and now he could not be sure of this. Sure? He could be sure of nothing. His whole life had become a hideous chance, in which the odds were fearfully against him; and those he loved he had set upon the hazard of the die—as men he had read of, vile and worthless men, had staked their wives and children against gold, and lost. His brain seemed all on fire.

'I have only to repeat, Dalton,' he presently heard the other saying, 'that I hope to be allowed to shew myself your friend. If you do go—no matter where—I shall be still here, in England, at your command, and at the command of those you leave behind you.'

'True, true,' answered Dalton, walking up and down. Holt looked at him inquiringly. They were strange words in which to acknowledge such a friendly offer. If he could have looked into the other's thoughts, he would have read something of this kind: 'Yes; he will be here

when I am far away; they will be poor, sweet souls, and he will be rich. He will dare what he has hitherto not dreamed of daring. He will ask her to become his wife—my Kitty! and she will spurn him; then she will taste of the bitter cup of penury and dependence, and he will importune her, and perhaps she will not spurn him. My God, it is terrible!

'I hope you will do nothing rashly,' observed Holt, doubtless alarmed by the wild looks of his companion.

'I hope not,' was the cold reply: 'unless, that is, you consider what is soon and sudden to be necessarily rash. I shall probably go at once.'

'But arrangements will have to be made with respect to your family—I mean business ones,' added the other, seeing Dalton's brow grow dark; 'you can't get away all in a hurry, even if it were only for this *Lara* business. I don't mean to say the law could stop you; but by leaving England at such a moment and supposing things came to their worst with the mine you would expose yourself to the suspicion of having done that very thing which, when I proposed that you should do it—although in a very modified form—you were ready to fly at my throat for the bare suggestion. Now, if you could get rid of the shares, with all their liabilities, as I honestly believe'—

'Once for all, Holt,' interrupted Dalton angrily, 'I shall not part with those shares; so it is idle to discuss the subject. As you say, there are many arrangements to be made, and quickly, so that I have no time to waste.' And with that he pitched the remains of his cigar out of the window, instead of placing it in its proper receptacle, and marched out of the room.

'*Qu'allait il faire dans cette galère?*' inquired Mr Richard Holt, when he found himself alone. He prided himself on his French accent to that extent that it pleased him to mouth the language, even when no one was at hand in whom to excite admiration by it.

'What maggot has he got into his head now?' mused he. 'The idea of a man like him, who has never been without kid gloves and a silver fork, expecting to make a fortune at the antipodes! Well, well; he may take his own way, with all my heart; and the sooner he goes, and the longer he is away—whether measured by time or space—the better I shall be pleased. Hunger, they say, will tame a lion; and poverty is a certain sort of hunger, and will tame most things, including a woman's heart.'

His face softened—all but those unsympathising eyes—and the man of scrip and share seemed to give himself up for a time to dreams. His fingers played softly on the table before him, as though in time to some unseen musician, and his lips followed an unheard song. Then something roused him: it was but Dalton's whistling to a spaniel upon the lawn, but he rose at once with a frown and watched him. The ruined man, with head depressed, and one hand buried in his pocket, was about to enter the shrubbery, doubtless for a solitary ramble. In his loneliness and melancholy, it seemed that he even sought the companionship of a dog.

Mr Holt, however, if he thus translated his friend's action, was by no means moved by it to pity.

'Hang the fellow, I don't know what has come to him,' muttered he, as he gazed out on his retreat-

ing figure: 'he used to be as malleable as clay, but now he is stiff against the potter. What on earth can have made him sweet upon these *Laras*? There's not a man in England—not now—who could have told him that they were not worthless, and worse than worthless. That is the evil of having to deal with a man that is not practical. All the arguments may be against him, yet he will stick like a leech to his own instincts, and sometimes, egad! and here Mr Holt grinned rather unpleasantly—'he may be right in so doing, in spite of himself and of his friends.'

Unconscious of this doubtful compliment, John Dalton had plunged with his four-footed companion into the mazes of the 'wilderness,' as that part of the shrubbery at Riverside was called which ran at the base of the hill behind the house, between the park and 'the grounds.' It was an artificial sort of place, plentifully provided with nooks and seats—perhaps in anticipation of some love-making in the family—but it was at present as solitary as Sahara. Here Dalton wandered for hours, forming the scheme, he had so suddenly determined upon, into a particular shape.

It is incredible to prosperous persons to what slender hopes men who have been overwhelmed by misfortune will cling, and especially if those hopes are few as well as slender. If their woes—God help them!—be exaggerated, as their friends are so prone to say, it is certain that they exaggerate their chances of redemption likewise. As prop after prop is torn away from beneath the superstructure, those which still remain are credited with a strength which, when they stood shoulder to shoulder with the others, would have seemed preposterous; and when all have been swept away save one—that one, like the last book of the Sibyl, is rated by its unhappy possessor at the same value as all the rest. Now, the last hope that was left to Dalton, in his own view at least—for we have heard another express an opinion that it was a source of apprehension rather than of comfort—was his interest in the *Lara* mine, nearly half of which indeed was his own property. He had been induced to invest in it by Holt's representations; and even now, though he harboured such strong suspicions of his conduct, he believed that those representations had been genuine. At one time, it was certain that Holt had himself purchased largely in the mine, and whatever might be wrong with the man in morals, his judgment in business affairs was undoubtedly sound. He was by no means rash in his investments, even where the prospect of gain was very tempting; and it was hard to believe that Holt would have held possession—even for an hour—of what, as it now turned out, might have ruined him root and branch. It was true that he had got rid of the shares, and even that he had advised his friend to do the like; but he had been by no means urgent about the matter, as would have been the case if he had suspected danger; and danger of this desperate kind (so Dalton thought) could hardly have existed without Holt's suspecting it. If the *Lara* was really the empty hole which Holt had described it, and which the papers had stigmatised it as being, he (Dalton) was ruined indeed beyond redemption; but if his own instincts about the matter, so curiously corroborated by his anonymous correspondent, and also by Holt's own unexpected offer to take the shares off his hands, were to be relied upon, things were not

so bad with the *Lara* as they seemed, and as some persons perhaps were interested in making them appear. The truth of the matter was only to be arrived at by visiting the mine itself, and this was the course that Dalton had made up his mind to adopt. In his hand was the advertisement sheet of the *Times* newspaper, in which he had already marked the sailings of the steamers for Rio. He would start by the very first, if his wife would let him. Not that his wife had ever opposed herself to will or whim of his; he meant rather if his love for his wife would let him; if he could bring himself to break this resolve of his to her ear—sweet unsuspecting son!—and then to put it into execution. To leave her in her penny and woful change; upon the brink, too, of her woman's trial—the time of all others when she would yearn for his comforting presence. If Dalton was of the silver-fork and kid-glove school, as Holt had said, his feelings were natural and wholesome. He loved his wife and children as much as if society had had no charms for him, nor he for it. The hardships that would lie before him in the new life that he was contemplating would probably be hateful to one nurtured and brought up as he had been, but they never crossed his mind. If he thought of himself at all, it was only in connection with those dear ones from whom he was about to tear himself; and even then, his main thought was, not how bitterly he would feel the wrench, but how it would rive and wound those hearts that were bound up with his. Could his darling Edith—bowed down, as he knew she was, notwithstanding her brave bearing, by their ruin—endure his absence upon so vague a quest, so far, and perchance so long? When her hour of anguish came, would she survive?—He had no courage to finish the dire foreboding, but threw himself on a garden-seat and hid his face, while the dog looked up at him in wistful wonder. From the park above, came the 'chip-chop' of an axe, indicating that the master of Riverside was engaged—quite independently of the time of year—in his self-imposed task of thinning the timber. 'What a life of ease does yon man lead!' thought Dalton bitterly. To him, indeed, it seemed that all men were free from burdens in comparison with the heavy load that cruel Fate had imposed upon his own shoulders, or rather—which was worse—that he had himself placed there. There was no one, down to the gardener's lad, whom he had just seen tending the mowing-machine upon the lawn, with whom he would not have exchanged places. The transformation that he had already suffered was greater than that would be, by far. If an ape's head—which he had richly deserved—had been substituted for his own, he could not have become more completely another man, except (alas!) that he was recognisable. He would be pointed at by every finger, as he went slouching by in his rags, as the man who had once been John Dalton.

He rose from his seat with a passionate curse; but the next moment his anger passed away. What did it matter if he did sink so low? It was only what he merited. He might stop and starve in England, and would deserve no pity. But for the sake of others, it behoved him still to try to hold up his head, and that could be done only by going elsewhere. On Sunday week a vessel sailed for Rio Janeiro from Southampton, and he would

go in that; not to seek a fortune, but upon an errand that he strove to think not quite so hopeless—to recover the one which he had lost.

ANIMAL POWERS OF OFFENCE AND DEFENCE.

THERE can hardly be any greater diversity observed in the animal series than that exemplified in the various means whereby animals are enabled to assume an offensive or defensive aspect. From the lowest to the highest grades of animal life—excepting perhaps man himself—we find ample provision made for the exigencies of animal existence, in so far as these exigencies demand the use of apparatus which gives its possessors some advantage or other in the 'struggle for existence.' Undoubtedly, in his superior intellectual organisation, which enables man even in his rudest state to avail himself of almost every feature in his surroundings for advantage and defence, the human subject has been endowed above all other forms; and he therefore compensates himself by varied arts and stratagems for the want of the more rigid and natural appliances of lower forms. But if it be true that art is most to be admired when it closely imitates nature, then the policy of man in his imitation, conscious or unconscious, of the many offensive arts of his humbler neighbours, must claim from us a fair share of favourable criticism.

Thus, it is a striking fact, that very many human means of defence or offence find their prototypes, or at least strangely analogous features, in the extensive armoury of the animal world at large. The lasso may be found in the apparatus whereby such a simple form as the *Hydra*, that tiny Fresh-water Polype, secures its prey. Or, when human sharpshooters think to conceal their whereabouts most effectually from the foes they purpose to annoy, and clothe themselves in garments of neutral tint, the hue of which shall most nearly resemble that of the objects amidst which they are located, this principle of imitation of natural objects again finds a strict parallelism in the animal world. For it is a familiar fact to all observers of nature, that the colour of most animals resembles more or less that of their natural surroundings. The colour of the Sand grouse, for instance, and other species of grouse, of partridges and other birds inhabiting heaths, or of flounders and other fishes inhabiting the sand, strictly approximates in character to that of their dwelling-places, and serves to conceal and protect such beings. And when we further discover that, in not a few cases, this principle of similarity to their surroundings is carried in some animals—such as the Leaf-insects and Walking-stick Insects—to the extent of close and actual *mimicry*, our surprise is increased.

Or lastly, when we find, as in the latest phase of modern warfare, that the concealed torpedo is used as a subtle and powerful means for effecting the destruction of whole fleets, the fact cannot but call to mind the electrical apparatus of some fishes—and notably that of the Torpedo or Electric Ray—which exists as a natural means of defence, the powers of which, few, if any, of their less-favoured neighbours care to test or provoke.

Whilst the consideration of the more prominent and typical means of defence in animals may very reasonably occupy our brief attention, a few words

on the subject of mimicry in the animal series may also prove interesting, more especially as this form of protection, through imitation of their surroundings, forms a simple yet effective means of defence to many organisms. We have already referred to the readily perceived and very general correspondence in colour seen throughout the animal world between animals and their abodes; and of the more general aspects of this condition nothing further need be said. The more special and striking developments of mimetic resemblances are found in cases in which not merely the general colour of their environments is imitated, but where resemblances of a close, and sometimes of a very extraordinary kind, to other animals, to plants, or even to inorganic objects, are to be noted. In the Leaf-insects, which are included in the same order as Locusts, Crickets, &c., for example, the wings are not only coloured to resemble leaves, but their structure imitates in the most exact manner the appearance of the veins of the leaf. Nor does the principle of imitation end with this sufficiently remarkable effect. In some Leaf-insects the colours of the leaf-like wings actually change with the season of the year; as if in the most perfect sympathy and harmony with the alteration of colours in the actual leaves. And the mimicry becomes of still more perfect kind, to our thinking, when we find that the wings of the Leaf-insect exhibit even the characteristic markings we are familiar with in leaves as produced by the attacks of minute insects; Nature thus imitating not merely the natural structure of the leaf, but the very imperfections to which the leaf is subject. It has been suggested that the little leaf-eating insects may be themselves deceived by the mimicry of their larger neighbours, and may actually eat into the wings of the latter, and thus produce the eroded appearance. But if this latter view be correct, it only makes out a stronger case for the perfect reproduction of the leaves in the wings of the insect. Mr Wallace has given us a very typical example of another such case of the imitation not only of leaves, but of the natural parasites of leaves, in a butterfly, the wings of which, on their under-surfaces, resemble leaves; whilst the imitations of decay of leaves and of the fungi that appear thereon, are so close, that, as Mr Wallace remarks, 'it is impossible to avoid thinking at first sight that the butterflies themselves have been attacked by real fungi.'

The Walking-stick Insects, as they are called, in their turn imitate, in the skeleton-like structure of their bodies, the appearance of dried twigs; and it is a singular fact that even in their awkward, ungainly manner of walking, the resemblance to the chance movements of twigs is clearly perceptible; the mimicry being rendered more realistic through this latter phase. Then, also, we find certain harmless groups of Moths imitating closely the outward appearance of species of stinging Bees and Hornets. And one remarkable case of mimicry is the well-known instance of some perfectly inodorous South American butterflies, which perfectly reproduce the external appearance of other butterflies which emit a most offensive odour; the reason assigned for this latter phase of mimicry being the very feasible one, that the inodorous forms are protected from the attacks of birds by their resemblance to their strong-smelling neighbours. As a last instance of this curious phase of animal organisation, we

may note the example furnished by those curious little fishes, the *Hippocampi*, or Sea-horses—so named from the obvious resemblance of the form of the head to that of a horse—the bodies of which become covered with long streamers of certain kinds of seaweed; so that when these fishes rest amidst the seaweed-covered nooks of their marine grottos, the presence of their streamers serves to render detection by their enemies no easy matter.

Referring to the explanation, if such can be afforded, of these mimetic resemblances, there can be little doubt that, viewed as to its ultimate use and purpose, the condition of mimicry serves in the most effective manner as a means of defence and protection to the animals so endowed. The resemblance of the colours of birds to that of their habitat, presents an obvious instance of this purpose; as also does the more complicated example of the imitation by scentless butterflies, of their odorous neighbours. But as regards the exact means whereby the condition of mimicry is induced and perfected, or concerning the exact causes of its assumption and development, natural history science in its practical aspect remains silent; although the bolder march of theory and speculation may indeed lead us for a little way towards the solution of the problem. At anyrate, there can be no difficulty to our clearly appreciating the workings of a great law of purpose and design in the production of mimicry, as serving to protect the weak and less powerful against stronger and better-provided animals.

Turning now to some lower forms of animal life, we find in such forms as the *Hydræ*, or common Fresh-water Polypes, the Zoophytes, Sea-anemones, Jelly-fishes, and allied forms, excellent examples of very specific means of defence and offence in animals. Within the tissues of the bodies of the foregoing organisms, when these tissues are microscopically examined, numerous little sacs or cells, varying in size and form, may be observed. To these cells, the appropriate name of 'thread-cells,' or *cnidæ*, has been given. When their structure is investigated, each little cell is seen to possess an elastic wall of double nature; the inner layer of the wall being strong, whilst the outer one is of thinner and more delicate texture. The upper or open extremity of the inner layer of the sac is prolonged to form a kind of sheath, which protects and gives origin to a thread-like filament, from the presence of which, indeed, these cells derive their name. This thread, in the ordinary condition of the cell, is coiled up within the interior of the sac, and around its own sheath; and in many cases both thread and sheath may be discerned to be provided with minute spines or hooks. The coil itself, in addition, contains a fluid, amidst which the thread is submerged.

Such is the essential structure of a thread-cell in its normal state of what we may term repose. When such a structure, however, is pressed or irritated in any way, the cell ruptures or bursts, the contained fluid escapes, and the thread and its sheath are quickly protruded or thrown out from the opening in the cell. If now, the thread and fluid are observed to come in contact with any body of appropriate and assailable kind, such a body will exhibit certain symptoms which will indicate to us the probable nature of these curious cells. Thus, when the tentacles or feelers of the Sea-anemone, or of any of the Zoophytes, come

in contact with a minute or susceptible organism adapted for food, the organism is first observed to struggle to escape from the entwining filaments which encircle its body. Soon, however, its active exertions cease, and the victim appears paralysed and incapable of helping itself, or of struggling longer with its captor. The thread-cells, in other words, have been discharging their miniature darts or 'threads' into the body attacked; the fluid—in all probability, of acrid or poisonous nature—has been poisoning the tissues of the struggling organism; and the observation has revealed to us that the functions of the cells are undoubtedly analogous to those of the serpent's fangs and poison-gland, in that they serve to paralyse and kill the prey.

As might naturally be supposed, the power of the thread-cells varies in different species and groups of the animals that possess them; but there are some forms of Cœlenterata—for thus the Hydree, Sea-anemones, and their allies are collectively named in which the stinging-cells are of sufficient size and power to inflict severe pain on man himself. Aristotle was fully aware of this latter fact, when he named the Jelly-fishes and their allies *Acalephe*, or 'Nettle-like' animals. And bathers and swimmers, through instinct, if not through zoological knowledge, generally and wisely contrive to give the Jelly-fishes a wide berth in their marine meanderings. The late Edward Forbes, in his humorous manner, says of one species of jelly-fish, that, 'once tangled in its trailing "hair," the unfortunate, who has recklessly ventured across the graceful monster's path, too soon writhes in prickly torture. Every struggle,' he continues, 'but binds the poisonous threads more firmly round his body, and then there is no escape;' for, as the naturalist informs us, even when the arms or tentacles are cast loose from the body of the jelly-fish, they 'sting as fiercely as if their original proprietor itself gave the word of attack.' The Abbé Diequemare, an observant French naturalist, found that some species can only sting the more sensitive parts of the body, such as the eyes. But Forbes's remark of the Abbé's experiment, that most people would prefer 'keeping their eyes intact, to poking meduse into them,' will coincide, we imagine, with the opinions of most of our readers. It is equally worthy of remark that 'appearances' in natural history, as in ordinary life, are apt to be 'deceptive;' and looking at the grace and beauty of the Jelly-fishes, we could hardly credit them with such virulent powers.

The most notable offenders of the Jelly-fish class, in respect of their stinging powers, are the *Physalia*, or Portuguese-men-of-war, as they are popularly termed—a group of beautiful oceanic forms, met with floating far out at sea, especially in tropical latitudes, and presenting the appearance of a bladder-like structure, provided with a crest and trailing streamers, and coloured of the most ethereal and beautiful of hues. When the tentacles of a *Physalia* are allowed to come in contact with the human skin, the thread-cells—which are of large relative size, and measure in diameter about the three-thousandth of an inch—sting so severely, that the effects of the irritation may persist for a considerable time, and may give rise in some cases to very painful after-effects. The thread-cells in the tentacles of the common species of Sea-

anemones have no effect on the skin of man; but as the writer has frequently demonstrated on his own person, if the tentacle be allowed to touch the more delicate mucous membrane of the lips, a slight stinging sensation, accompanied by temporary numbness, may be felt. To the curious, this is worth trying.

Passing in review the higher groups of the animal kingdom, we find an endless variety of contrivances subserving offensive purposes, or limited to the milder purposes of defence. Shells, scales, and plates of every kind, with special modifications for special purposes, may thus readily be selected as examples; spines and allied armaments of all shapes and sizes; poison-secretions and fangs of centipedes and serpents, and the sting of scorpions and bees, possessing sure and sometimes deadly effect on those they attack; and, in quadrupeds, strong claws and teeth united to equally powerful muscles—such are a few examples of the endless stores of weapons contained in animal armouries.

THE FEAST OF FIRST-FRUIT.

A KAFFIR FESTIVAL.

As the matter of the Kaffir chief with the unpronounceable name, *versus* the Colony of Natal, has attracted a good deal of attention in this country, it may not be uninteresting to relate my experiences when visiting Langalibalele in person, for the purpose of witnessing the *unkosi*, or great spring feast, which he was then holding.

This ceremony, which takes place in February or March, earlier or later according to the district, or the forwardness of the season and the consequent ripening of the crops, and upon which the commencement of the native year depends, is held at the principal residence of the chief, and, being a sign of royalty, is not permitted to take place within the precincts of the colony without the consent of the lieutenant-governor; before it no natives ought in theory to taste the new crop, though in point of fact they do so, as in many instances starvation would be the alternative. I had never seen it, and as I was only about thirty miles distant from Langalibalele's chief village, I sent a messenger announcing my desire to attend, and asking for information as to the day fixed for its celebration. Not long afterwards the man returned with a civil answer from the chief, saying the great dance would take place on the following day but one, and that, if I would come and sleep at his village the night previous, he would be glad to see me. Few preparations are needed in Africa, a blanket strapped on to the saddle sufficing for bed and bedding, and hospitality being trusted to for all besides; so next morning I started on horseback, merely accompanied by a native boy with a spare horse, and after a pleasant ride of some six hours, including a short halt at midday, we arrived at our destination.

It was quite evident, as we approached the place, that something unusual was going on: natives were clustering about the outer fence like ants on a disturbed ant-heap; the great cattle inclosure, round which the huts are built, was black with heads, excepting a small spot at the top, where, from the respect shewn it by the natives, I rightly guessed the chief must be. As soon as I had reached the main entrance, and had

dismounted, I was met by two officers sent to take charge of me and conduct me to the chief. It would have been utterly impossible to have forced a way through the inclosure itself, where several regiments were drawn up four or five deep, in half-circles facing the chief; and it was with very great difficulty, and by a very liberal use of the sticks they carried, that the officers cleared a passage outside; many a not very complimentary remark about myself in particular, and white men in general, meeting my ears from the rather outspoken young soldiers through whom we passed; though, in justice to them, I may mention that they probably did not imagine that I understood their language, so rare, even at the present day, is that accomplishment. At last, making use of the private entrance to the inclosure at the top of the village, we found ourselves in the presence of Langalibalele, who was seated surrounded by a number of his sons and principal men.

The usual native salutation was offered me, as I came up, by the chief, rendered into English for my benefit by an attendant clothed in a hut and pair of trousers.

'Sar, king say, how you do?'

'Very well,' I assured him in the same language.

'Sar, king say, you like see blacky nigger dance?'

I told him that at present I had no other object, and then seated myself in a chair, which had in the meantime been brought for me. The chief thought he had done his duty in the conversational way; but his sons and officers proceeded to catechise me on every subject their curiosity could suggest, still making use of the interpreter, whose renderings were often so far-fetched and ridiculous, that had I not understood the original, the conversation would perforce have come to an untimely end, and which so amused me that some of the people began to say that evidently I was a good-natured white man, as I laughed so much when I talked.

The attention of all was, however, soon engrossed by the black mass of soldiers which filled the whole area of the inclosure before us; who, laying their shields down in front of them, and the half-dozen heavy sticks and knobkerries which each of their number carried by their sides, began as one man to sing one of the songs which had been composed for the occasion, and consisting of a series of unceasing eulogies of the chief.

This, sung soft and low, to a not unpleasant though simple tune, by the united voices of some two thousand men, women, and children, had, despite the singularity of the words, a soothing and grateful effect in the still evening air, though the constant repetition soon became wearisome. I was therefore not sorry when, suddenly ceasing as the chief rose, they sprang up, and brandishing their sticks, filed by regiments out of the inclosure, each, as its turn came, rushing forward, shouting their war-cries, or defiantly singing regimental songs, while the long and heavy sticks of their officers rattled on their shields in a vain attempt to maintain order and discipline.

The chief now addressed me in person, saying that he had assigned me a hut in the private royal apartments, and that, after I had rested and been provided with food, he hoped to see me in his own hut. I looked about; the tall interpreter in the wide-awake and tattered trou-

sers had disappeared, so I was obliged to ejaculate, in his own language, 'Very well, chief, and thanks.' Upon which a sudden creaking all about me indicated that every neck had been twisted round to look at me, amid astonished exclamations of 'Fancy! why, it can speak!' This astonishment soon gave way to delight on the part of Langalibalele and his people as I convinced them, by going on talking in their own language, that I was as thoroughly at home in it as they; this feeling expressing itself by remarks that, 'Really he is quite a man, and not a wild beast;' 'You would think he was a black man, and not an unlimbe' (or manufacturer, as whites are often called).

Politeness and etiquette are, however, prominent features of a Kaffir's character, and the impropriety of keeping me waiting outside, after the chief had intimated that my hut was ready, was soon seen and redressed. The word 'village,' I may remark, except in its primary meaning as an assemblage of dwellings, conveys but a faint idea of an African's residence. It is in truth nothing more or less than a wanderer's encampment become permanent. In the olden days, while these tribes still lived in tents, and moved from pasture to pasture with their flocks and herds, the tents were planted in a circle, with a space left inside, where the cattle could pass the night in safety. When they ceased wandering, the same circular form was still retained, the tents became huts, and two fences, one confining the cattle inclosure, one the entire kraal, were added. Such is, to the present day, a Kaffir village; but, in the case of one belonging to a chief, a large portion sacred to his wives and children, has come to be fenced off at the upper and most important end, in which huts of superior size are erected, and it was to one of these that, as a distinguished guest, I was conducted. Food, in the shape of beer made from millet, and cooked goat, was brought me; while a few minutes after, sundry bleatings announced the arrival of a live goat, with a message from the chief to say that here was a 'chicken' for my present consumption, and that to-morrow he would look me out a 'goat.'

One great advantage of being in the royal apartments, was to insure me privacy; and though an occasional slave-girl would drop herself on to her knees at the entrance, and peer in, yet, as the king's wives and children were all aware that I was eating, and it is considered rude to intrude upon any one of position while thus engaged, I was left pretty much to myself for an hour or more, until an attendant came with a message from the chief requesting my attendance. On entering his hut, which was nearly double the size of any of the others, I found Langalibalele sitting alone on one side, while the other was crowded with a number of the principal men of the tribe drinking beer. A couple of candles dimly lighted up the smoke-blackened interior, and, as they flickered in the draught, gleamed fitfully on the black, grease-besmeared skins of the natives.

Beer-drinking in enormous quantities was the order of the evening, the amount drunk by each man being something extraordinary; and at last the noise and confusion of voices became so great, that, though all were perfectly polite to me, I was fain to excuse myself to the chief on the plea of being tired, and retire to my own hut. On going outside I discovered that the noise was far

from being confined to the royal apartment; a tremendous medley of sounds rising from the cattle-inclosure, which was, I could see, lighted up by several large fires. Not feeling much inclined for sleep, and enjoying the coolness of the evening after the stifling heat of the crowded hut, I turned out of the 'palace,' and passing through the upper entrance into the inclosure, stood watching the curious scene, myself unobserved. There might have been a thousand men and boys congregated round the carcasses of a couple of oxen, at which they were hacking with their spear-heads; the elder cutting off slices and handing them to their boys, who threw them into the fires, which crackled and hissed with every fresh addition. A number sat squatted on their haunches earnestly watching the culinary operation, while others were bolting huge mouthfuls of half-cooked meat from which they knocked the clinging embers. No tongue was silent; singing, shouting, and quarrelling were all going on; and it says a good deal for the noise in the chief's hut that they had been inaudible there. Altogether it was a wild, and a wholly African scene. Next morning, the first sound that caught my ears was the hum of many voices coming nearer and nearer. It was the soldiers who had slept where they had gorged, under the covering of heaven, and were now coming to salute the chief.

After a time there came a message from the chief that all the regiments were going to march to another of his villages and back again, and that, if I chose, I could accompany his eldest son, who was going to ride there with them; an invitation which I was not slow to accept.

For the first half-mile after issuing from the mpangweni, the men, in default of a band, kept up the droning hum of an old war-song, but after that they marched silently and steadily along. Now and then could be heard the voices of the officers ordering the companies to 'close up,' or the rattle of their sticks as they drove a laggard forward, or stopped the head of a regiment pressing too nearly on to the next. Nothing of note occurred until we reached the village for which we were bound, from whence we had to fetch three regiments stationed there in default of room for them at the mpangweni. As our front files came into view of their destination, they struck up one of the great war-songs, which was instantly taken up by the whole column. We could see the hurried rush of the surprised occupants of the kraal, as they fell into their respective companies and marched out, forming in a semicircle in front of the main entrance, maintaining silence, and drawn up with great regularity, with their shields half-concealing their bodies. These shields are about four feet high, and some thirty inches broad in the centre, being oblong in shape, and made of the thickest portions of an ox's hide. The chief's son with whom I was, now assumed command, and as each regiment came up chanting the war-song, it was drawn up where he pointed out, silence not being enforced until the men formed into line; the ultimate result being that he and I were left sitting on our horses in the centre of a vast ring of troops, only a small space being left between those who had arrived with us and those who were stationed here. He then gave a few directions, after which we returned homewards in much the same manner as we had come.

Breakfast, which I had been unable to get before

our early start, occupied my attention immediately on our arrival; while the men, breaking up into small parties, buzzed in and about the kraal seeking what they might devour, nearly a thousand women and girls having arrived since our departure, bringing food of various kinds for their relations, as the chief, beyond an ox or two, never attempts to cater for his troops. My own wants were amply provided for, the *pièce de résistance* being a sort of bread made from very young maize, which was very sweet and pleasant to eat, though podgy and probably rather indigestible.

The time for the work of the day—the great dance—had, however, now arrived, and when I went out of the chief's residence, I was surprised to find how many of the womenkind of the tribe had already assembled to witness it; several thousands having taken their stand on a rising ground a little above the kraal, from whence they could see everything. Langalibalele had told me on no account to leave him, or to mix among the soldiery, as they were so unruly and excited on these occasions that I should probably meet with insult, if nothing worse, and he therefore had a chair for me placed by his own on the spot where the dance was to take place. The various regiments, after appeasing as best they might their ravenous hunger, had taken up position wherever shade could be found within a few hundred yards of the village, and were now gradually mustering. The ground chosen for the dance was a great flat sward not far from the principal entrance, and to this Langalibalele, attended by all the great men of the tribe who were not in command of regiments, and his elder sons, and accompanied by me, now bent his steps. The dress he had assumed for the occasion differed but slightly from his everyday garb except in richness of material, but, much as illness had altered him, nothing was needed to tell the stranger that there stood a great Kafir chief, a man accustomed from his birth to slavish deference and obedience. He could not be called handsome, the inclination to obesity which the life of all Kafirs of position seems to induce, spoiling what would otherwise have been fine proportions; but his face was intelligent, though worn-looking, and rather spoilt by an expression of cunning. When we reached our chairs we found some of the older regiments already drawn up, several deep, in front of us, while the others were filing up, chanting their songs, to take up such positions as were pointed out to them; the general plan being to form a large inclosure of which our party would form the head; the picked troops, the main body, in front of us, and the younger regiments the two wings. Once I thought we were in for a general row; two of the younger regiments had come up together, and drew up almost facing each other, waiting for orders about taking position. As usual, they were all shouting their war-cries, and at last one of the men, excited beyond control, sprang forward and performed the bravery dance under the very noses of the opposite company; the furor spread; half-a-dozen men sprang out from each side fairly boiling over; a possibly accidental collision occurred, a blow was struck, and in half a second more the front companies were fighting fiercely. Langalibalele jumped up, called the principal regiment, composed of men of between thirty-five and forty—fine, tall, well-built fellows they seemed—and rapidly ordered

them to 'make peace' by 'thrashing those boys.' Half a second sufficed for them to rush forward in column, and in less time than it takes to write it, they were drawn up in two lines, facing the half-cowed 'boys,' some dozen of whom with broken heads lay about on the ground. The officers of the two rival regiments then began to thrash all and sundry who seemed inclined to create further disturbance, and each was marched off to its respective place, while the quellers of what might have ended (as indeed it did later on) in a serious row retook their former position.

The ceremony then commenced by Langalibalele in person rising and starting the *Ungoma* or great war-song—which no one dares to sing except by the order and in the presence of the chief. It was short and very monotonous, its gravity seeming to affect the limbs of the performers, who marked time with their arms and feet with the greatest solemnity. It is this marking of time that is the chief feature of native dancing, which is nothing more than a song accompanied by certain gestures of the arms and body, while time is also marked with the feet; the unison of every stamp, both as regards time and the particular foot used, being wonderful. The whole vast semicircle move hand, foot, and arm in accord, while at the same time there is much scope left for individuality in the performance.

This over, another war-song composed for the occasion was sung, and had the effect of gradually working up the passions of these savages to a state of frenzy; they broke their ranks, and, dancing forward in the most furious manner, the whole ground soon became a mass of legs, and arms, and hands with sticks in them, working up and down in the most dire confusion. The black bodies shining with perspiration, the madly waving plumes and fantastic ornaments, combined with the echo from the trembling ground, as every foot, still keeping the most perfect time, was brought down on it with redoubled force, the rising dust half-concealing the whole scene, made it one of the most curious I had ever witnessed. In time, it was evident the dancers were becoming exhausted, as before long the voices died away, and left nothing but a hum, more than half-drowned by the heavy, dull, but regular thud of thousands of feet; but still they danced madly on, while the chief's attendants surrounded us, and dealt blows with a heavy hand at all who dared approach too close. This lasted for upwards of half an hour, by which time the men were fairly beat, and were glad enough to form line again, and stand at ease. Another and yet another song and dance succeeded, though none equalled the first, until at last the chief, taking up his position in the centre of the circle, called to such of the principal warriors as he chose to name to come out and perform the bravery dance before him, each company cheering vociferously any of their number who was thus summoned. Once, rival braves came to blows, but the application of many sticks soon drove them back into their respective lines. The bravery dance merely consists in springing forward out of your rank, and 'playing' at performing some deed of valour, shouting meanwhile your war-cry; and the natives often get so frightfully excited while doing it, that they are undoubtedly, for the time, in a state of mental frenzy.

This part of the performance, lasting for two

hours or more, became decidedly monotonous; and though it closed the ceremony of the Feast of First-fruits, I was not sorry when it was over, the old chief having first danced in person, amid the united yells and shouts of the assembled tribe. The moment, however, that the regiments moved off the ground, the two which had already fought began bravery dancing in defiance of each other, marching meanwhile in parallel lines; and before long it was evident that they only wished to get far enough off to make sure of no interference before having it out. The chief, of course, sent down half-a-dozen officers to keep the peace; but the dance was over, and, so long as he did not get into trouble with the government about it, no doubt he rather enjoyed the idea of the young regiments learning a little practical fighting, as they very soon did, for in another ten minutes they were at it again, tooth and nail, the sticks rattling on the shields like hail, and the men fighting most pluckily and determinedly; until, after watching it for some time from the head of the village, the chief sent out orders for all the regiments to go and *lamula* (make peace), which they did by thrashing all they could catch, though, as the fighters ran away when they saw them coming, they had not much to do. Several men were, however, dangerously hurt, some very nasty wounds having been inflicted with knobkerries.

It being a fine moonlight night, I determined to ride back that evening; and, after a farewell visit to the chief—who, whatever his sins against the colony at a later date, had certainly treated me most kindly—I got my horses, and proceeded homewards.

LITERARY IMPOSTURES, CONCEALMENTS, AND MYSTERIES.

A curious chapter in literary history relates to wilful falsification, wayward deception, misconception of an author's identity and meaning—one or all of these according to circumstances. Sometimes a writer claims as his own a production that proceeded wholly or in part from another brain. Sometimes an author has professed to make a journey to a distant and little-known region, and has published a description of it, due wholly to his own invention, or amplified by bits taken without acknowledgment from other books. Many instances are on record in which a writer assumed a name that did not belong to him; while still more numerous are those wherein an author, for reasons sufficient in themselves, leaves just so much mystery as to give rise to a wide range of conjecture.

About the middle of the last century, one Mr Lauder startled the literary world by the publication of a circular in which he accused Milton of having borrowed from a previous author some of the versified materials for *Paradise Lost*. It was easy to accuse a man who had been dead three-quarters of a century; nevertheless, Milton's reputation stood too high to permit this charge to be passed over in silence. Lauder named the author, and quoted passages strikingly like some of those in the great English epic. Dr Douglas took the matter up. He obtained a copy of the work with some difficulty, and went through it line by line, without finding any such passages as the accuser had professed to quote. What he *did* find was

this—that one Hogens had translated *Paradise Lost* into Latin in 1690; that Lauder had taken eight lines from this translation, and stated that he had found them in the works of Staphornius, a Dutch poet and divine. Meanwhile, not knowing what Douglas was doing, Lauder obtained subscriptions for a new edition of Hogens' poems, or that part of them which contained the passage supposed to incriminate Milton. When the work was actually printed, the result of Dr Douglas's examination was made public. The publishers, Messrs Payne and Bousquet, insisted that Lauder should place in their hands the veritable book from which his excerpts had been made. He then confessed that the whole affair was an invention. The publishers issued a small edition of the work, but inserted this prefatory note in each copy: 'As this man has been guilty of such a wicked imposition on us and the public, and is capable of so daring an avowal of it, we declare that we will have no further intercourse with him; and we now sell his book only as a curiosity of fraud and interpolation.' Dr Johnson, before the cheat was discovered, had so far been imposed upon as to furnish a preface and postscript to the work. Lauder endeavoured to ward off public censure by giving first one motive, then another, for his conduct. He fell into obscurity, and died in great poverty about twenty years afterwards.

Book-buyers were invited, in 1701, to purchase a *History and Description of the Island of Formosa*, by George Psalmanazar, a Christianised native of that country. The work made a great stir. It was vividly written; the details were minute; and numerous engravings depicted the houses, vehicles, shipping, &c. of the Formosans. There next appeared *Dialogues between a Japanese and a Formosan*, concerning religious matters; together with a grammar of the Formosan language, a vocabulary for the use of strangers visiting that beautiful island, and a series of translations of prayers and short sentences. The reading public were greatly interested in learning so much concerning a remote region until then little known except by name. A few better informed men suspected that all was not genuine. George Psalmanazar mixed openly in society, and bore with great ability the questionings and cross-questionings to which he was subjected. After two English editions, and two or three foreign translations of his principal work had appeared, the bubble burst; conscience pricked him, and he confessed that he had been deluding the public. Full particulars of his life were never obtained, nor was his real name known; but it was accepted as probable, from facts one by one ascertained, that he was a native of Switzerland; that he had great natural abilities, and had received a good education; that for some years he led the life of a vagabond adventurer, living by various impostures in several countries of Europe. His Formosa fraud was known to and encouraged by an army chaplain in Holland, who brought him to England, and obtained for him those high recommendations which so advanced his schemes. His 'last will and testament' contained expressions of deep contrition for the reckless and dishonest conduct of his early years.

In 1700 a small work was published, purporting to be a translation into English of a Gaelic poem written by Ossian in the third century; and these were followed by a few other specimens soon after-

wards. They excited great interest in Scotland, on account of their alleged antiquity; and the translator and editor, James Macpherson, a Highland schoolmaster, acquired notoriety. Critics, however, especially critics conversant with the Gaelic language, suspected that all was not as it should be. Macpherson had obtained the good opinion and aid of Home, the author of *Douglas*, and had been assisted with funds to enable him to travel about the Highlands, as a means of collecting specimens of early Gaelic poetry. What he had published had been translated from his English into French, Italian, Danish, and Polish; and 'Ossian's poems' began to take a place in European literature. It was therefore desirable to settle whether they were authentic or not. The Faculty of Advocates sent him on another tour to collect further specimens; he apparently reaped a rich harvest, but nobody could tell *where* he found what he pretended to find—ancient Ossianic manuscripts. Lord Kames, Sir John Sinclair, with the poets Blair and Gray, contended for the authenticity of the publications; while Dr Johnson, David Hume, Malcolm Laing, and Pinkerton, more or less openly accused Macpherson of deception, in having written English poems, and palming them off as translations from very old Gaelic. As Macpherson scorned, or at anyrate refused, to reply to any accusations against him, the controversy went on without his assistance. About twenty years afterwards, Mr Shaw, author of a Gaelic Dictionary and Grammar, published a vigorous onslaught on the Ossian poems; declaring that internal evidence shewed them to be modern instead of ancient; and pointing to the fact, that Macpherson had never publicly shewn the old manuscripts which he professed to have discovered. Malcolm Laing, an historian of Scotland, adverted to inconsistencies and even impossibilities in the alleged poems. Wishing to set at rest a question naturally so interesting to Scottish men of letters, the Highland Society, in 1804, drew up a series of questions, printed them in circulars, and sent these circulars to every part of the Highlands and islands of Scotland. They asked whether any persons had ever heard any poems, long or short, in Gaelic, attributed to Ossian; and whether they could repeat what they had heard. Slowly did the replies come in, and the members of the Society were unwilling to come to an unfavourable decision on the subject. Though the controversy has of late been again raised, Scotland has arrived at a pretty unanimous verdict that the poems published by Macpherson are a cento or patchwork, partly fictitious (that is, written by himself), and partly copies or adaptations of poetry orally current in the Highlands.

We must not call the *Letters of Junius* a deception; the writer merely wished to keep secret his own identity, but left the world to conjecture at leisure as to who he might be—the name of 'Junius' being a fanciful one. A literary conundrum were these 'letters,' and such they still remain. They were published a little over a century ago, between 1769 and 1772, and produced amazing excitement in England by their brilliant satire, scathing denunciation, and polish of style. More than forty theories have been put forward concerning the name of the author. The balance of opinion has long tended towards Sir Philip Francis; but the matter is not even now settled.

For reasons which seemed to him sufficient, Scott concealed for many years the authorship of the *Waverley* novels and romances. He did not make the truth known until the curiosity of the entire reading public had been raised to a feverish height. If at any time he were asked point-blank whether he was the author, a few twinges of conscience may have troubled him at the necessity or temptation to tell an untruth on the subject; but this is an annoyance likely to befall any great writer who maintains the *anonymous* for a series of years.

Thomas Chatterton, who in one sense lived a long life before he was eighteen years old, was one of the most extraordinary literary deceivers on record. Born at Bristol, in 1752, he was taught a small routine of knowledge at a parish school, and then belonged to the Colston School from his eighth to his fifteenth year; afterwards he led the life of a drudge in an attorney's office. Antiquities, especially of an artistic or poetical kind, were the special objects of his liking; and in this direction he manifested at once his genius and his fraud. In 1763 a new bridge was opened at Bristol; and there appeared, in *Felix Farley's Journal*, a translation of an ancient manuscript, under the title 'A Description of the Fryars passing over the Old Bridge.' The antique phraseology, and the vividness of the description, attracted general attention; but the whole affair was the product of Chatterton's own brain, although he indulged in plentiful lying when pressed for an explanation. This first deception marked his sixteenth year; and the remaining two years of his brief career may be characterised as one continued falsification. He handed to a Bristol tradesman a pedigree, tracing his ancestors back to the Norman times, and claiming to the astonished shopkeeper relationship with many a noble and knightly personage in past ages. He produced the *Bristol Tragedy*, and other poems, declaring them to have been written by one Rowley, a priest of the fifteenth century. He brought forward some old parchments, descriptive of the principal churches and chapels in Bristol; they were wholly his own production; but by discolouring them with smoke and ochre, and imitating old writing, he completely deceived Mr Barrett, who was at that time writing a history of the city. He wrote to Horace Walpole, inclosing pieces of ancient writing, purporting to be biographical sketches of Bristol painters, scarcely if at all known to the public, and offering to place in his hands a large collection of such papers. Walpole, who was at that time preparing his *Anecdotes of Painters*, entered upon the subject with great interest; but his critical judgment soon detected the fraud, and he shook off the impostor. Some London booksellers made Chatterton an offer which tempted him to come to the metropolis, where he was chiefly employed in writing satirical party articles. The attention they attracted gratified his enormous self-conceit; and in a wild burst of excitement he said to a friend that he hoped, 'by the blessing of God, very soon to be sent prisoner to the Tower, which will make my fortune.' The 'mad genius,' as he was called, had long brooded on suicide; and he put it into effect at a squalid lodging in Brook Street, Holborn, and did not live to see his eighteenth year.

Another of these strange palterings with truth is

known as the 'Ireland Shakspeare forgeries,' a publication that scandalised all literary men who possessed any reverence for truth. Samuel William Henry Ireland, born in 1779, was the son of Ireland the engraver, respectably though not eminently known in his profession. The father's love for relics and memorials connected in any way with great men was the bait that tempted the son into dishonesty. The two visited Stratford-on-Avon in 1795, with the main purpose, on the part of the senior, of bringing out a description illustrated by his sketches and engravings. Young Ireland, who had been articled to a conveyancer, after their return told his father that he had accidentally found, among some law-papers, an old time-worn deed or lease containing Shakspeare's autograph. The father, overjoyed at such a find, urged him to search for further memorials of the great poet. 'An unfortunate request, as the result speedily shewed. Young Ireland pretended to find one curiosity after another, until enough had been collected to form a volume. He caused it to be noised abroad that one of the newly found treasures was a tragedy by Shakspeare, bearing the title of *Vortigern*, but that he would not publish it until it had been acted at one of the principal theatres. Sheridan, though not without misgivings as to the quality of this dramatic composition, fell into the trap, and gave a considerable sum for the copyright. John Kemble undertook the principal character; and, public curiosity being excited, there was an immense house. The audience waited and waited for touches of Shakspeare's genius, but waited in vain; for the piece was one of the baldest and most inane. The curtain fell amid a storm of hisses, and *Vortigern* at once disappeared. Meanwhile Malone and other critics had disputed the authenticity of the so-called Shakspeare discoveries generally. The too credulous father, rendered uneasy by these things, insisted on the son giving full particulars of the when, the where, and the how of his findings. The young cheat then made a clean breast of it, and confessed that they were all mere inventions.'

OUR ONLY SNAKE.

A TALE OF THE MAURITIUS.

WE were a party of four—made up of our host, old Dr Fairbairn; young Thompson, assistant-surgeon of the —th, quartered at Mahébourg; Captain Blogg, of the same distinguished corps; and myself. We sat in the verandah after dinner, smoking and half-dozing, when the doctor suddenly said to his brother professional: 'By the way, Thompson, I had a fine specimen of the cobra da capello given me to-day by the skipper of the vessel that arrived with coolies from Madras.'

'Ah, really; you must let me see him.'

'And what may that be you're talking about, doctor?' said Captain Blogg, as a sound like the booming of cannon ceased in the corner at which he was seated; for he was a heavy sleeper.

'A species of snake,' replied Dr Fairbairn.

'A cobra, did you say? The deuce and all! A snake here!—a live one, d' you mean?'

The doctor nodded.

'Well, now, I've always maintained that if there was one redeeming point about this precious

island, that point was the absence of snakes. Another illusion destroyed! Mauritius, I give thee up!

'But, Blogg, one snake can't make a colony, you know.'

'I don't know. I'd believe anything about snakes.'

'The species is very venomous, I've heard, doctor,' squeaked in a shrill treble the assistant-surgeon, who was an earnest young man, and ardently devoted to his profession. He had a nervous cough and wore spectacles.

'I believe you. You should have seen the Creole at the Custom-house jump as he opened the box in which the skipper had carefully placed the glass case with my specimen. It saved the skipper some duty on trinkets and filigree-work, I expect, for the box passed without further inspection.'

'And do you mean to say that this venomous reptile is under the same roof with us, and only a bit of glass between us and it?' and Captain Blogg appeared disquieted.

'True, O king! But the glass is very thick, and—'

Smash! There was a cry and a scuffling of feet.

'Lui fin allé lui fin sauvé, m'sieu!' cried a servant, running in with affrighted looks.

'Who's gone—who's escaped, 'cré Malabar?'

'Pambo, Sahib,' cried an Indian servant.

'How did it happen, *crétin*?'

'Moi n'a-pas connaît, m'sieu. Le p'tit gokhra lui cassé!'

'Oh! no doubt. Of course, it was the gokhra that did it all, and you lazy wretches are as innocent as doves. Be off at once. Search the house; and if you find it, kill it at once, d'you hear?'

'Oui, oui, kill him, kill him, I say!' shouted Captain Blogg as the fellow disappeared. 'Pon my word, the idea of a snake or gokhra, as that fellow calls it, makes me quite nervous.'

'Well, you're all right anyway, Blogg, for they've made your bed up in the pavilion to-night. If the thing gets out of the house at all, you may be sure he's had enough close confinement, and will be off for the jungle at the back, or down to the river at his first chance.'

'Yes; my theory is that, in his present famished condition, he should first make direct for your hen-house.'

'Oh, hang your theories! You look as wise as an owl, Thompson, but you ain't as cunning as a serpent. My peace of mind has gone for the present.'

'Well, my wife will give you a cup of tea to restore it,' said the doctor; and we went in to the drawing-room.

Captain Blogg, though generally a very entertaining person—not so much from wit in himself as from being the 'cause of wit in others'—was by no means an amusing companion during this evening. He planted himself carefully in the middle of the room, on the stiffest and most uncomfortable chair he could find, avoiding cushions or antimacassars, or anything that might harbour an unwelcome intruder. His glance fell restlessly upon the floor and corners of the room. He turned pale, as a skein of dark wool fell across his knees from the table; the familiar and harmless lizards darting across the walls in chase of moths, assumed startling shapes to him; and when a dark moving

something gradually protruded its increasing length beneath the door (it had been raining heavily), with an exclamation of 'Jump for your lives!' he bounced to the top of his chair, and hurled a photographic album of Mrs Fairbairn's at the object. The object proved to be nothing more alarming than a meandering stream of water that a leak in the verandah had admitted. At which he revoked, trumped his partner's trick, and paid no heed to the common rules of the game—errors, which when committed by others, he was wont to declaim with all the authority of a member of the Portland. It was a relief to everybody when the time came to retire to rest; and Captain Blogg and I betook ourselves to the pavilion, a wooden erection apart from the house, and divided into two compartments, which served for sleeping-rooms when the house was full.

The night was oppressively hot, and I sat for some time in the pavilion verandah, where darkness proved something of a shelter from the mosquitoes, with which the place abounded. Blogg wouldn't sit up, and had gone to his room at once. I was in the middle of my second cheroot, when an unearthly yell from the direction of Blogg's room startled me, and in a few seconds he was standing before me, while he leaned one hand on the back of my chair, and whispered in a hoarse voice: 'The snake! I'm bitten! Quick; bring the doctor at once.' As he sunk into a chair, I hastened off, and having wakened Fairbairn and Thompson, we were soon again at his side, our hands full of restoratives, our tongues full of inquiry.

'Oh, there's no mistake about it,' said poor Blogg. 'I heard the thing give a hiss, and then felt the bite. I was half asleep, and had thrown my leg over the side of the bed. Look here; here's the mark.' And he pointed to a livid spot on the calf of his leg. The two doctors examined it carefully.

'D'ye see any puncture, Thompson?' said Fairbairn.

'No; but that's of no importance,' replied Thompson, whom I had heard muttering as we came across from the house: 'Poor old Blogg. But snake-bites ain't met with every day; very interesting; I'll take notes.'

Meantime, a jorum of about half a tumbler of whisky had been administered to the patient, and Thompson had made a note of his temperature, the state of his pulse, and had flicked the candle about in front of his eyes, to ascertain the state of the pupil—a manner more suggestive of an 'interesting case,' than of sympathy for the victim, and which the victim resented.

'What are you fooling me about for like this, I say, Thompson? Can't you do anything to help a fellow?'

'Temper irritable,' noted down Thompson in a few hieroglyphics in his book.

'Can't do much for you, I'm afraid, poor old chap,' he continued. 'We're going to inject ammonia beneath the skin presently. You don't feel your tongue swelling at all, do you, or a creepy sensation down your back, or anything?'

'O dear, O dear!' groaned the sufferer, heedless of these professional inquiries, and thinking of approaching dissolution.

Presently he gave a roar as Thompson gave him a sharp prod with a needle.

'All right, all right,' said the latter cheerfully; 'no loss of sensibility--yet.'

Dr Fairbairn was hard at work pressing and cleansing the wound, uttering at intervals various consolatory expressions, and had administered another dose of the whisky, which by now was having visible effect on the captain. His utterance became thick.

'Do you remark,' said the junior to Dr Fairbairn, 'thickening of speech--sensory-motor nerves affected?' and down went his pencil to paper. 'I say, his teeth look fixed, don't they?--tetanic spasms commencing;' and he rashly applied his forefinger to the barricading teeth, which the captain very naturally kept closed, to avoid an attack with forceps upon his tongue; but the 'tetanic spasm' was insufficient to prevent the ardent young surgeon from receiving a smart bite from the patient, who feared that there was a design upon his tongue.

Captain Blogg had now become alternately querulous and maudering. 'Thompson, you're a foolish cold-blooded pill-box. No; I shan't be quiet; and you ain't going to squirt that stuff into me, I can tell you. Dush hypodermic injections! Yes; I *can* wink with one eye, and be hanged to you; and I don't feel a numbness in my lower extremities. I shay, Fairbairn, ain't he a brute? Fancy dying in this way, eh? Shpose Shmith'll get the step. Don't like Shmith. Make my will, eh? That's a good un! Got nothing to leave but a few debts, and a case of three star Hennessy. Thompson can have the debts, and you may have the brandy, old chap. Can I walk? Yes, I can walk;' and rising to his feet, he reeled from one side of the verandah to the other, and finally brought up short against one of the supports, which he embraced tightly.

'No co-ordination of movement--mischief to the cerebellum,' said Dr Thompson, as he and Dr Fairbairn went to the patient's assistance. By this time the whole house was up; servants were running about more noisy than useful. Mrs Fairbairn had arisen and made anxious inquiries as to the accident, when we were all surprised at a merry peal of laughter, which proceeded, without doubt, from that excellent lady.

'Most unseemly!' said Dr Fairbairn.

'Horrid, cruel, most unfeeling shex!' moaned the captain.

'Odd!' said Dr Thompson.

'William, William, come here!' cried the lady, as soon as laughter permitted her to speak; and Dr Fairbairn, with an angry look, asking me to take his place, went out. He returned, however, with his own face distorted with laughter, and going straight to the room that Blogg had occupied, shouted out: 'All right; here's your snake, Blogg. I've got him!' and giving a hurrah, and a bang with a stick, a goose waddled from under the bed and flapped her wings about the room, hissing angrily at the treatment.

Captain Blogg's bed had been made up by an intelligent servant over a tub in which a sitting goose had been placed. The captain's overhanging leg had offered an irresistible mark.

He didn't appear at breakfast next day, but went off early. Pressing duty, we afterwards learned.

Dr Fairbairn's cobra was never heard of again, but doubtless had a merry time of it amongst the jungle-pigs and rats.

SPRING.

Spring! harbinger of joys renewed,
Of earth by smiling heaven wooed,
Of sweet full-throated harmony,
Waking to song each budding tree,
Ere yet the leaves have music made,
And learned to throw a whisp'ring shade
O'er the chequered ground which lies
Beneath their woven canopies.

To thee, I ween, the feathered choir
Carols its sweetest, and desire
To do thee homage prompts the song
Which trills the fields and woods among,
When softer suns have bidden shoot
The timid blossom, and the root
Has trustful given to the air
The blade that frosts retreating spare.

Sailing athwart the lucent blue
That peeps the cloudlets' silver through,
The rook right busy homeward steers
To where, through cycle of long years,
Th' elms have ever branched 't' entwine
The wind-tossed cradles of his line.
A tend'rer herbage springs apace
To feed new scions of the race
Which thronging speak the sunlit green,
And wanton where of late hath been
Chill snows that penned the bleating plaint
For freedom 'mid the pastures faint.

With clearer wavelets speeds the rill
To join the river that will fill
The sov'ran sea with tribute-tide,
Yet loves it on its way to hide,
And, rippling, tell each idle stone
And sleepy branch, that now has flown
The frost which checked its highland source,
And stemmed its long impatient course.

With fairer hues the young earth glows,
And presage gives what summer-shows
Of flow'ry splendour soon will burst
When June, rose-baden, is the first
To tempt the amorous nightingale
To warble forth his nightly tale,
If love, not sorrow, be the note
Which, swelling, strains that quiv'ring throat.

With softer tones the sweet West plays
Amid the trees all through the days,
Which lengthen slowly, till once more
Gray twilight's hour ne'er dies before
The curfew, and the bats 'gin glance
Full nimbly after winter's trance;
Then comes again the lovers' hour,
When loving eyes have brightest pow'r,
And low-breathed vows may best be heard,
And inmost chords most gently stirred,
For magic's rife in twilight's mirk,
And what more magic than love's work?

Spring's eloquence alone can tell
What sweets with her fair self do dwell;
'Twere vain for any mortal hand
To sweep the lyre, when her own band
Of choristers proclaim the joys
Her bounty brings. Mere jarring noise
Were mortal song, when ev'rywhere
One burst of music fills the air,
And drowns all meaner notes that vie
With Nature's one great symphony.

OLD TIMES AND NEW.

IN the present day, when one seldom or never hears of anything like peculation and fraud in connection with the administration of public affairs in England, it is apt to be forgotten that this species of integrity is but of comparatively modern date; for readers of history well know that there was a time, not so very long ago, when among the higher classes in England, as well as Scotland, there prevailed quite as despicable a species of corruption and double-dealing as is now lamentably visible in the United States. Going back no farther than two hundred years ago, we find instances of peculation, fraud, and barefaced deception so very astounding as to be scarcely conceivable—men of the highest title and position, when they had a chance, pocketing money not their own, and selling themselves to rival parties and dynasties with as much complacency as is now exhibited by the meaner order of voters at an election in Norwich. The grotesqueness of the whole affair is enhanced by the fact that the period notable for these delinquencies was peculiarly signalled by fervid ecclesiastical wranglings. Men who would have suffered death rather than give up their cherished religious distinctions, did not scruple to rob and plunder at all suitable opportunities. There was no want of ecclesiasticism, but wonderfully little morality.

Summoning up an array of departed greatness united with profound villainy, the first who presents himself in the spectral throng is that heedless and incorrigible being, Charles II. Devoid of principle, he sold Dunkirk to the French for five hundred thousand pounds, and pocketed the money, instead of paying it into the national exchequer. That, however, was about the least of his treacheries. During his whole reign, he privately accepted a pension in the form of a bribe from Louis XIV. James II., his brother and successor, was equally base in becoming a dependant of the French sovereign. The conduct of these two, the last of the reigning Stuarts, who brought ignominy on their race, can be looked

back upon only with sentiments of unutterable detestation. When kings were so far forgetful of honesty and self-respect, what could be expected from the statesmen and other public officials of the period? Among those who come gaily to the front as deprecators is John Churchill, who ultimately became Duke of Marlborough. Born of a good but impoverished family, John got so little education that he was never able to spell. But wholly unscrupulous, he sacrificed his honour in a way we refrain from mentioning in order to be appointed an ensign, from which position he, by court-favour, rose to be a captain and lieutenant-colonel. Marrying Sarah Jennings, a lady as remarkable for her beauty as for her talents and imperious disposition, Churchill was raised by James II. to the peerage as Baron Sundridge. Never for a moment losing sight of the main chance, he ostensibly deserted the cause of James, when that luckless monarch fled to France, and passing over to William, Prince of Orange, he was made by him Earl of Marlborough. While in the service of William, he greatly distinguished himself in fighting against the French, yet all the time by secret manoeuvres he fraudulently kept up an intercourse with James at St Germain. It was a beautiful case of double-dealing. According to Macaulay, who has tracked him out by ransacking the 'Stuart Papers,' Marlborough had no sense of probity. He cared neither for Whig nor Tory. The only thing he cared for was money. 'All the precious gifts which nature had lavished on him he valued chiefly for what they would fetch.' With the most winning manners, he cheated right and left. As a military commander, he drew a large allowance, under pretence of keeping a public table, but he never asked an officer to dinner. He made up fraudulent muster-rolls. He pocketed pay in the names of men who had long been dead, killed in battle in his own sight years previously. There were twenty such names in one troop, and thirty-six in another. The historian offers proofs of these villainies, but a more magnificent act of villainy is still to come. In the whole round of state annals there

is perhaps nothing to match it. As a revelation of the depths of avarice and treachery in the human heart, it is invaluable.

King William determined to send a powerful naval expedition to attack the French at Brest. The command was given to General Talmash. At this time, 1694, Marlborough was in London, dancing attendance on the court, and under civil as well as military allegiance to King William. Having furtively discovered the purpose of the expedition, he sent intelligence of the attack to James at St Germain, in order that it might be communicated to the French government. The result of this nefarious transaction was that the English force on trying to land at Brest was cruelly defeated, Talmash was mortally wounded, and four hundred sailors with seven hundred soldiers were killed. With his last breath, Talmash exclaimed that he had been lured into a snare by treachery. Loud were the expressions of grief and indignation. No one could be fastened on as the author of the calamity. 'The real criminal,' says Macaulay, 'was not named; nor till the archives of the House of Stuart were explored, was it known to the public that Talmash had perished by the basest of all the hundred villainies of Marlborough!' The explanation given of the treachery is simply this: Marlborough had two years before been set aside from active duty, and wanted to get the post occupied by Talmash, so that he might carry on his old system of plunder by drawing pay for men who did not exist. Subsequently, as is well known, this able but bad man distinguished himself in the war of the Spanish Succession, was raised to a dukedom, and died full of riches and worldly honour in 1722. The truth has now come out regarding him. With all his brilliant talents, he was a cold-blooded, scheming traitor. Such was the great 'Mallbrouk,' of French ironical song.

At the close of the late Franco-German war, when accounts were overhauled by the French authorities, there were some amazing disclosures of fraud; one of the worst being that of an army contractor who had supplied to the soldiers shoes with paste-board soles, which went to wreck almost immediately on being used, and whole regiments, though apparently wearing shoes, were really marching barefoot. Tricks of this kind, either through the connivance or folly of commanding officers, were quite common in England towards the end of the seventeenth century. Arthur Herbert, Earl of Torrington, as First Lord of the Admiralty, and Admiral of the Fleet, was so careless of his duties, that the sailors under his command were nearly starved. The dealers who contracted to supply the navy sent casks of meat from which even dogs turned away in disgust, and also barrels of beer which smelt worse than bilge-water. So badly were merchant-ships protected by Torrington, that their proprietors glully paid immense bribes to secure the convoy of Dutch privateers.

The contests between the Old and the New East India Companies (1693) were a fertile source of demoralisation. The Old Company wishing to preserve its valued monopoly, never hesitated, as occasion required, to purchase the favour of men in power. They scattered bribes wholesale, but perhaps never so profusely as when an endeavour was made to get a renewal of their charter. Fearing that the charter might not be renewed, the Directors put a

hundred thousand pounds at the disposal of Sir Thomas Cook, an eminent merchant in London, to be distributed among the great men at Whitehall, and for which no questions would be asked. Among the parties who participated in this shameful bribe was the Marquis of Caernarthen, afterwards Duke of Leeds. The charter was secured; but the corruption that had been practised was ultimately disclosed, and Leeds only escaped impeachment by sending the principal witness against him out of the way. Cook, the distributor of the bribes, was sent to the Tower, but was so fortunate as to secure a bill of indemnity by offering to tell all he knew of the business. In the whole case we are reminded of that in which General Belknap and certain state officers at Washington have lately and very painfully been mixed up.

It appears to have been quite customary for navy and army contractors to give bribes in money to officers to pass their accounts, in which articles of a worthless kind were charged at extravagantly high prices. Henry Gey, a member of parliament and Secretary of the Treasury, received a bribe of two hundred guineas for some jobbery of this nature, and the delinquency being discovered, he was sent to the Tower. About a month later, Craggs, who had begun life as a barber, and risen to the dignity of an army-clothier, was sent to the Tower on a charge of corrupting the colonels of regiments with whom he had dealings. The pillage that went on in all departments of the state proved a source of extreme vexation to King William, who felt himself to be surrounded by little better than a band of robbers. It was difficult to say who could be trusted. Professed Whigs and professed Jacobites were alike deceitful. The precincts of Whitehall and of Holyrood swarmed with politicians as corrupt as could now be found in Athens, Washington, or New York. There was a state of universal corruption. The leading men about the court, including Russell and Godolphin, were, like Marlborough, see-sawing between loyalty to James and William, and a deep stain has accordingly been left on their character.

In these Old Times, as has been often observed, the Scottish nobility and gentry shewed an immense aptitude for bribes to soothe their feelings when changing, or pretending to change, their politics. If anything, they were more rapacious than their English neighbours, because they were more needy; but, to do them justice, they were generally satisfied with smaller sums. One of the least scrupulous of the wretched set was Campbell, Earl of Breadalbane, to whom, under the Revolution Settlement, was assigned the onerous duty of pacifying, more properly, buying up, the Jacobite clans. For this purpose, a large sum, said to be twenty thousand pounds—which would go the length of three times that amount in our days—was put at his disposal. He succeeded in quieting for a time a few turbulent chiefs, but never gave any explanation of what he had done with the money; and it has always been the universal belief that he kept the greater part of it to himself. The melancholy fact is, that during the whole affair, while professing loyalty to William, Breadalbane was carrying on an underhand correspondence with St Germain, and contriving to bring about a rebellion. At the outbreak of 1715, he sent five hundred men to join the standard of the Pretender.

Burton, who has the merit of having brought to light a vast number of curious particulars concerning Scottish history, tells us to a penny the amount in sterling money given by the English government to buy off the opposition of certain Scottish noblemen and gentlemen to the Union. To make things look decent, the cash was imparted in discharge of illusory accounts. A few, such as the Duke of Athole and Marquis of Tweeddale, got a thousand pounds each; the greater number had from two hundred to three hundred pounds; one had fifty pounds; and Lord Banff received the more pitiful sum of eleven pounds two shillings. The Earl of Marchmont stands at the head of the roll as having pocketed £1,104, 15s. 7d., and so nicely 'had he estimated the value of his conscience, as to give back five-pence in copper, on receiving £1,104, 16s.' The sum-total which was distributed among these needy opponents of the Union was £20,540, 17s. 7d. The English may be congratulated on having made so good a bargain; and the Scotch of the present day have no reason to be dissatisfied.

Modern novelists seeking about for a plot, would have an excellent choice in the history of the period in which the austere but upright William was beset by crowds of titled penulators—Marlborough, of course, in the foreground, with the voluptuous Torrington, the treasonous Russell and Godolphin, and the avaricious Leeds, followed by Gny and Creggs, commencing on their misfortunes in the Tower. As regards inferior characters in the piece, some fun might be extracted from Taaffe, a Roman Catholic priest, who turned Protestant, and set up the business of an informer on unfortunate Jacobites. Artistically, a good deal could be made of Taaffe. How he persuaded the Secretary of State to send him with a body of officers to search for evidences of treason in the mansions of noted Jacobites in Lancashire; how, when the officers were searching for concealed stores of arms, Taaffe went into the private chapels and adroitly pocketed silver crucifixes and other articles of value. And then what a splendid dénouement! Taaffe selling himself to the poor Jacobites, whom he had plundered, and stating at their trial at Manchester that all he had reported against them to the Secretary of State was a downright lie; whereupon the court breaks up, and the unfortunate judges are hooted and pelted out of the town. With such interior furnishings, the story would be as amusing as *Peveril of the Peak*; and it might at least, in a graphic way, give an insight of the manners at the court of William and Mary.

But long after the taciturn Dutchman and his affable English consort had passed away, corruption continued to flourish in high quarters. It was rife in the reign of Queen Anne, though not always successful in escaping detection. Sir Robert Walpole, while a member of parliament and Treasurer of the Navy, was found guilty by the House of Commons of 'a high breach of trust and notorious corruption,' and accordingly was expelled the House and sent to the Tower (1712). Restored to fortune on the accession of George I., Walpole rose to eminence as a statesman; but till the last—and perhaps impelled by the difficulty of securing friends to his administration—he reduced corruption to a science by a skilful adaptation to individual wants: to one a bribe in money, to another a place, to a third a title, and so on, till all in turn

were pleased. The plan was eminently successful. Peace was secured by what, after all, was no great outlay by the state. Few prime ministers have been so distinguished for his ingenious artifices as Sir Robert Walpole. In our own times he is best remembered as the author of the saying sadly humiliating to human nature, 'that every man has his price.'

It would be a fine theme for a philosophic essay to trace the gradual extinction of corrupt practices in the English administration along with the growth of an acute sense of honour in all public transactions. A man of any mark high in office would be now loath to have his name associated with acts of bribery and corruption such as were by no means uncommon in the reign of George II. The writer of any essay on this subject, while speaking of the influence of moral agencies, would not forget to shew that very much of the delinquency of past times was a direct result of balancing opinions and interests between two rival dynasties. For fifty years after the flight of James, there were lurking hopes of a Restoration; and not until these hopes were stamped out on the field of Culloden was there anything like a distinct progress in those virtues which now distinguish the best order of society in Britain. Under later auspices, our country, in all departments except among Stock Exchange gamblers, Prospectus-mongers, and the very meanest of the population, has happily and so effectually thrown off the scandals which discredited the conclusion of the seventeenth and the early years of the eighteenth century, that a disclosure of what took place in Old Times will appear to be scarcely credible. Corrupt administrative practices of superlative extent and magnitude, it is sorrowful to think, have found a home in other lands where a keen sense of personal honour is lost in party struggles, and where leading officials seem, from all accounts, to be but imperfectly acquainted with the elements of social and political probity. w. c.

FALLEN FORTUNES.

CHAPTER XXI.—THE POWER OF 'OLD TIMES.'

'FORRU, darling, I have thought of a plan.' This was the way John Dalton 'broke it' to his wife in her chamber that afternoon; he felt that with her it was no use to silver the bitter pill, for that her love, no matter what disguise they wore, would detect the aloes.

'A plan, dearest?' answered she, in trembling tones. There was something in his voice, though he had made it as buoyant as he could, that presaged to her of ill.

'Yes, love. The more I think of that Brazil mine, the more I cling to it. I think with you, that that strange warning, not to deem all as lost there, came from a friendly hand; and though I do not say that Holt has played me false—I have no proof of that, you know.'

'Never mind Mr Holt, love, now,' interposed she calmly.

'Well, I have come to the conclusion that the best and only course that now lies open to me is to see after the thing with my own eyes—to go to Brazil.'

'To go to Brazil!'

How faint and full of fear that echo was! She had been standing by his side, with one hand

resting on his shoulder, and he felt her clutch it, to save herself from falling.

'Yes, dear; why not?' he went on in cheerful but caressing tones. 'It is what men of business are doing every day: a few weeks out, a few weeks home again. We miss them at the club for a month or two, and then they are back again so soon, it seems impossible they can have gone so far—not that it is really far away nowadays,' he added hastily. All his fineness, all his dexterous phrases, had clean gone from him. The despair in his wife's eyes had disarmed him of all those weapons which he had been wont to wield so well.

'If you think, darling, that I had better stay at home—that is,' added he with a wan smile, 'in England, and trust to the chapter of accidents; to the possible aid of friends, or the special intervention of—of Fate' (it was curious how the spectacle of his Edith's misery made him rebellious against the *Ilum* which, if it had not caused it, still had not warded it off, and how again her sad reproving glance brought him back in an instant to submission)—if you have any reasonable expectation that things may mend with us; that to-morrow will be not like to-day, and yesterday, and all other days since this befell us, void of help and hope—I will stay on. Or, if you feel that the parting from me—for six months at most—is more than you can bear'—

'No, no!' she murmured hoarsely, while her face, sharp, anguished, racked with woe, denied her words. He did not look upon it, but kept his eyes upon the pattern of the carpet, though one hand clasped her own, and one was thrown about her waist and held it close.

'I am yours, God knows, Edith, in any case, but having lost your all, the least I can offer is myself, to go, to stay, exactly as you choose to order it—only this seems the best. Iolt cannot tell—or will not—how matters at St José really stand. No one in England seems to know about it, and none has such cause to care as I. It will at least be movement, action. I shall feel that I am doing something, striving to build up a little what my folly has destroyed; I shall not, as now, be sitting with folded hands, watching the gathering clouds before they burst and overwhelm my dear ones—O Edith, let me go!'

'Go, dearest, go,' said she. 'If any hope lies that way, go—to Brazil. We shall not our hearts at least will not be parted: all day my thoughts will be upon you, and all night, if sleep should come, my dreams will be full of you. O God, protect this man,' exclaimed she passionately, 'whom Thou hast given unto me to be mine own, and bring him back to those he loves!'

She had fallen on her knees upon the footstool by his side, and on her upturned face the sun was shining. No pictured saint with glory on her brow ever looked more pure and fair.

'What am I, what am I,' thought Dalton, 'that this sweet soul should importune Heaven for me? What are we all—we men—that our women should do the like for us? And would they do the like if they knew what we were?' "To those he loves," she prayed, but not "to me." He took no note of that when the words were spoken, but yet they lived with him, and looked at by the light of things to come, had afterwards a keen significance.

'And when is it you think of'—

'The steamer by which—subject to your wishes, dearest—I design to sail leaves Southampton on Sunday week.'

'So soon!' sighed she. 'But you know best.'

'Nay, darling, I know nothing. But it seems to me that what I am to do, if it is to be done, should be done at once. Iolt tells me that there is no means of getting information—except by telegraph—from the agent at St José, or from the English expert who was sent out to see about the mine. Now, I'm sure if I asked Campden, he would say at once: "Go and look into this matter with your own eyes. Search your well for the truth while the water is clean, which it may be the interest of some people to sully." There is no doubt that the whole affair is a swindle, but still there may be some advantage in getting to the bottom of it.'

Mrs Dalton sighed. It might be so, or it might not, but her mind reverted to the times—not so long ago—when her husband had had nought to do with any such matters.

'If your time is so short, darling, would it not be right to let the dear children know? Every hour that they now pass away from you, in ignorance of its preciousness, they will regret hereafter. "We might have been with dear papa," they will say, when you are far away, John.'

'Let us wait till we get home, dearest. It is but two days more. If we told the girls and— and Tony'—their very names melted the waxen heart within him 'they would never keep the secret. I don't want Campden to know it, and especially that woman'—it was thus I am afraid that Dalton, although unconscious of his disrespect, indicated his hostess 'while we are still their guests. We will part company just as usual, and then I will write and tell him.'

'The girls will be very brave, John—of that I am certain; and as for Tony, except for the pomp and circumstance of being an Eton boy, he has no ambitions to be shattered. As for his education—at all events for the present—that will be superintended by Jenny, who, he has always protested, has taught him more than all his other teachers put together.'

'Poor Jenny, poor Jenny!' murmured Dalton. To his heart of hearts, his invalid daughter was the dearest of all his little flock; and when he shewed it, it was gladly pardoned to him by all the rest, by reason of her infirmity. 'O Heaven!' cried he in anguish, 'that I should have brought my Jenny to such a pass as this!'

'Jenny will do very well, John,' returned his wife with cheerfulness.

'What!' exclaimed he, almost in anger; 'without doctors, or sea-air, or comforts such as she has always been accustomed to, and which she needs more than all the rest? No, Edith; she will die, and it will be her own father who has'—

'John, this must not be,' interrupted his wife reproachfully; 'if you break down like this, what will become of us?'

'That is what I am thinking of,' answered he bitterly.

'Well, and I have been thinking of it too, and have hit upon a scheme for the future, which I should have told you a while ago, only your great plan put my little one out of my head. My notion is, that when we have got rid of our house, which of course must be done as soon as possible,

we should all go and lodge with Mrs Haywood. The dear old woman dotes upon the girls, as much as when she was their nurse, and I am sure would be delighted to have us. I think we could live in Brown Street as cheaply as anywhere.'

It was wonderful to see how this fragile and delicate creature, bowed down by present misfortune, and full of worse foreboding for the future, rose up to confront the evil day, and make what provision she could against it.

'It would be cheap, no doubt,' observed Dalton ruefully. 'Let me see; she lives somewhere out Pentonville way, does she not?'

'You ought to know, John, since you furnished the house for her. She, poor dear old thing, always speaks of you as though you were a sort of deputy-Providence. We could all be housed safely and snugly there, you see, till you came back again, and you would feel quite comfortable in your mind about us. With a good house over our head, and the dearest old landlady in Christendom to look after us, and Tony's education going on, why, there will not be so very much to complain of, after all.'

Dalton's mind had wandered to Brown Street, which, in spite of his late inquiry, he remembered very well. When Kate and Jenny emerged from childhood, and Tony was sent to school, and there was no longer need of Nurse Haywood's services, instead of pensioning that faithful and affectionate woman—the same who had given Jenny, by-the-bye, her favourite desk—Dalton had bought the lease of a small house for her, and fitted it up for the reception of lodgers. The old lady preferred to get her own living—she always 'liked to be doing summat,' she said; 'and could never abide being idle'—rather than 'to take wages for doing nothing;' and it was now fortunate indeed that she had been provided for in this way. The happiest days of her life were those in which her old mistress or her young ladies would drop in to take a dish of tea on an afternoon, in her back-parlour, and talk over old times, while their fine carriage stood outside her door to the admiration of the neighbours. As a general rule, 'carriage-people' did not come to Brown Street, which was not in a fashionable neighbourhood. It was in a northern suburb, new, and therefore comparatively clean, and Mrs Haywood's little mansion was the pink of cleanliness; if she ever used strong language it was excited by the indignation against 'them dratted blacks,' which she regarded as a 'Southerner's' the living negro in rebellion. But this was a feature into which Dalton did not go; it was the insignificance of the place and the poorness of its surroundings—not its cleanliness—that presented themselves to his mind. He beheld his Edith, accustomed to luxurious dwellings, raiment, food, living out in this poor spot the remainder of her years; gradually forgotten by the world in which she had moved and been admired; he saw his Katy, already the belle of many ball-rooms, though so young, become a household drudge; he saw Jenny—the bright, courageous, stricken girl—fighting in vain against such enemies as poverty and solitude; he saw Tony, shut out from the class to whom he belonged by nature as well as birth, and growing up a City clerk. It was a picture, every detail of which inflicted upon him pain and remorseful pity. He could not face his Edith's future with the courage with which she faced it for herself.

When she said that 'there would not be so much to complain of, after all,' he could not mirror back her smile, nor add one word of comfort to swell the meagre stream of her content. Her plan, however, pitiable as it might be, was practicable; and all that could be *done*, that could be set about with hand or brain, in his sad case, was welcome to him. He wrote at once to his lawyer, with regard to the immediate disposal of their house in town, and his wife wrote to Nurse Haywood, as she was still called. By the time their replies could be received, there would be no reason for further concealment; and if it were possible, Dalton wished to see matters arranged for his dear ones before quitting England.

Alas, how much precaution, prudence, providence for others is thrown away in this world; though, let us hope, the affection that has dictated them will be taken into account by Him who provides for all. What tears are shed for only seeming woes! What bulwarks are set up with infinite pain and loss, when, in fact, there are no assailants! What energies are wasted for a shadow!

That very day, when the afternoon post came in, John Dalton marked his friend and host look up at him from a letter with a look that told him his secret was discovered. He was always on the watch for such a look. It seemed to him strange that even the very servants were unaware that he was a ruined man; and now it had come at last. It was scarcely to be expected that some echo of the tidings which he had confided to so many would not return to Riverside before he could get away; and so it had happened.

Holt and Tony were in the room at the time; the boy had just received a letter from a school-friend, who had preceded him to Eton, which painted the joys of that famous school, and he read scraps of it aloud in triumph. 'What fun it must be, papa, must it not?'

And with no unusual tenderness (though his heart was nigh to breaking) he had answered: 'Yes, my boy;' and then stepped out of doors alone, in expectation of Campden following him, which he did immediately.

Dalton heard the familiar footsteps on the gravel-walk behind him moving quicker than usual, and felt the friendly hand laid upon his shoulder; and he stopped, but did not turn his head. Perhaps, he had some suspicion—so bitter had he become of late—that his old friend's face might be already changed towards him.

'Why, Dalton, my dear old fellow, what is this? A man has written to me this afternoon, and tells me'—

'It is true, Campden,' answered the other hoarsely: 'I know the news he gives you. I am ruined.'

'Ruined, John! I hope things are not so bad as that!'

There was a genuine and tender sympathy in the inquiry, and yet there was something too that jarred on Dalton's ear, so sensitive had sorrow made it.

If things had not been so desperate with him then, it seemed this man would have taken the matter coolly enough.

'Things are quite as bad, Campden; they could scarcely be any possibility be worse.'

'That is what one always thinks when one is knocked over for the first time. Yet one often

finds there are no bones broken, after all. How has it all happened? My correspondent writes it was a mine: things, in my opinion, as dangerous in speculation as in warfare.'

'Yes; but, unfortunately, I did not consult you,' answered Dalton coldly.

'Well, my dear fellow, do it now,' returned the other good-naturedly. "'Two heads are better than one," even though the one may be the longer. Don't be savage with me, for it is I, remember, who have cause for annoyance rather than you. I mean,' added he gently, since Dalton remained silent; 'I might well complain, as your oldest friend, that you have been applying to others for assistance in this matter, instead of first coming to me.'

'I knew you could not help me, Campden--except in one way,' answered Dalton in a softened tone; 'and I was proud, and wished my ruin to remain unknown until I had left your roof.'

'I should have hoped that my roof would have been as your own, John, and myself as yourself. There, there--let us come into the shrubbery. How about this mine? Where is it? Or does it exist at all? Sometimes they don't.'

'It is in Brazil--the *Lara*. Near the great St José mine.'

'The *Lara*! Why, my good fellow, that has burst up altogether. It was a plant, it seems, from the very first. How, in the fiend's name, did you ever get connected with such a thing?'

'It is scarcely worth while to go into that,' replied Dalton doggedly. 'I am connected with it. Everything I have in the world is in it.'

'Then you have been swindled.'

'Very likely. I am not quite sure, however, how the matter stands. I am going over by the next Rio mail to see after it myself.'

'You are going to Brazil?'

'Yes; that is fixed. It is at least better than going to perdition, which I should feel that I was doing every day that I stopped here in England with my hands before me.'

'And your wife?'

'She knows it all--knows that I have lost my fortune and her own by my cursed folly; and that I have just this slender hope left of retrieving it. She has made up her mind to part with me. She has ten times my courage, and a hundred times my worth. God help her!'

'I say Amen to that, Dalton. But why should she not stay here--she and the girls--while you are away? I am sure Julia!'

'Thank you, but that is impossible,' interrupted Dalton. 'It is, nevertheless, an unspeakable comfort to me to know that I leave her and hers with such a friend to counsel and assist them as yourself. You will be true, and tender to them, I know; you will remember old times, George, and your old friend, even if you never see him more.'

'By the help of Heaven, I will, John!' answered the other.

The two friends grasped one another's hands in silence. Neither of them were men much given to sentimental reminiscence; but at that moment the door that shuts out the Past swung back upon its noiseless hinge, to each disclosing many a sunny picture: a grass plot in a college court; a lime-walk musical with bird and bee; a river running under many a bridge, past sloping gardens; sung chumbers, loud with youthful revelry. They had lived among such scenes together

long ago, and had had such joys in common as only youth, on whom no shadow of coming care has need to rest, can know. 'The hand that reaches through the mist of time, and touches hearts, was on them both. For half a second they were boys again; then habit resumed its sway.'

'You will draw on me of course, Dalton, in case you should need money out yonder,' observed Campden; and he threw his thumb over his shoulder to indicate the geographical position of Brazil.

'I hope that will not be necessary,' said the other, smiling.

'I hope so too; no one *wants* to be drawn upon; only, if you require a banker, at least give me the refusal.'—

'Hollo, Tony, what is it?'

It was a relief to both men, but especially to the one who had thus tendered his good services, and was beyond measure apprehensive of being thanked, that their conversation was thus interrupted. The boy ran to them eager-eyed and flushed with haste—a very Ganyমেদে of a messenger.

'Please, papa, mamma wants you when you are disengaged.'

'And what is your hurry about, young master?' inquired Mr Campden.

'Dr Curzon is here, and he says I may ride his pony.' He was off again like a shot.

'That is a likely boy of yours, Dalton.'

'Yes, poor lad. He little thinks that he will never see Elton.'

'But why should he not? It's a pity such a clever little chap as that—quite a chip of the old block, I'm sure—should be deprived of his schooling. Come, I'm his godfather; let me take so much at least upon my shoulders. You are not too proud for that, surely. If you are, I shall see what Mrs Dalton can do with you.'

'You are most kind, indeed, George; the fact is, Elith and I had arranged that Jenny was to be his tutor for the present; but I should be very glad to spare her.'

'Then, that's settled. Nay, I won't keep you from your wife another moment, so let's say no more about it. The boy shall not be balked of going to Elton.'

ARTIFICIAL STONE.

In the *Journal* of December 25, 1875, page 831, the following paragraph appeared: 'In Saxony, a method of hardening sandstone has been tried with success. The stone is soaked in a solution of alkaline silicates and of alumina, which penetrate some inches, and impart so great a degree of hardness to the surface that it will bear polishing, and has the look of marble. If exposed to great heat, the surface vitrifies, and may be coloured at pleasure.'

The paragraph, although not introduced for such a purpose, suggests occasion for doing justice to an eminent inventor, and offering a few notes that might serve for an interesting chapter in the 'History of Inventions.' These purposes will be effected by a brief account of the inventions and processes by which Mr Frederick Ransome, of the well-known Ipswich family, preserves natural stone and manufactures artificial stone. The same

essential principles are involved in each process; and from a description of his mode of making artificial stone, his method of preserving natural stone may be readily inferred.

Mr Ransome commenced his toilsome and difficult career as an inventor in 1844. He received his inspiration from observing a workman at the Ipswich works renewing the worn-out ridges of a buhrstone for a flour-mill. The hard siliceous prominences and the softer parts of the stone alike had to be cut down to the same level; and the first step in his inventive faculty was the desire to produce a homogeneous stone of uniform texture throughout. The thought led to action. It was easy enough, as may be supposed, to find the materials for the basis of such a stone; but the discovery of a cementing agent to bind together the particles, constituted the grand difficulty. He had then only a slight acquaintance with the respective properties of mortars or cements of any kind, and had not as yet got beyond elementary knowledge in chemistry or mineralogy. He tried in succession as a cement plaster of Paris, shellac, glue, isinglass, mastie, lime mixed with bullock's blood; but all these were failures. He next added a portion of pulverised glass to the sand, subjected the mixture to hydraulic pressure, and exposed the moulded blocks to the heat of a furnace. This was a step in the right direction, but still a failure. The moulded pieces broke up in the furnace, or ran into vitrified masses. He then commenced operations upon flints, in the hope of obtaining a species of liquid glass. Having mastered certain chemical facts, he put a quantity of flints and caustic alkali into an improvised Papin's Digester. He tied down the lid of the pot with wire, but by and by, fearing that it might burst, he flung it into a cistern, when it flew to pieces, and happily disclosed by its contents that his labours had not been all in vain—the flints had been reduced to slimp; and he now knew that he could reduce flints to about the consistency of melted glue. In short, he had found the cement he needed for his pounded stone or grains of sand.

This was the first decided step towards the attainment of the greatly desired end. By combination of this semi-fluid—obtained from silicic acid, flint being really an acid and soda, he had found a means of uniting sand, gravel, or other material, for the manufacture of artificial stone. For this invention he took out a patent in April 1845, in which he merely claims as his invention the use of soluble silicate of soda as a cement for binding together the particles of sand, pulverised stone, detritus of stone, or other similar materials; the material so produced to be subjected to pressure in the moulds, and dried in an oven. This method and these materials were defective in two important respects; the dried stone was liable to be again dissolved, and the drying was attended with great difficulties, inasmuch as the surface took a hard texture, impermeable to the moisture in the inner parts of the stone, which could only escape by fissures, injurious or altogether destructive of the production. These difficulties were, by improved modes of desiccation, overcome to a great extent; but the materials and process were still defective. His achievements up to this point, however, commanded so far the attention of scientific men, that in 1848 he was awarded the Telford Medal by the Institution of

Civil Engineers, for his paper on the Manufacture of Artificial Stone.

It was probably consideration of the best means of arresting the decay of natural stone that stimulated Mr Ransome in the direction that led to the most important of his discoveries. About 1852, before the Houses of Parliament were finished, the ornate carving and even the plain portions of the façades had begun to fall into decay, and stones in all parts of the grand structure were rapidly disintegrating. The indurating applications to stone had hitherto been of resins, oily, or other organic substances, that were readily acted upon by atmospheric influences, and in their application caused discoloration that was highly objectionable. Mr Ransome felt that his colourless soluble silicate, or solution of flint, was the proper preservative agent to be employed, and concentrated his attention upon the endeavour to overcome the chief objection to it, to remedy its avowed defect, namely, that it was in itself soluble, and would in time succumb to the humidity of the atmosphere. He had by this time made great progress in his studies in chemistry, in so far as that science bore upon his special pursuit; and from a sound basis he evolved important practical results by a process as beautifully simple as it is important. His numerous experiments and labours in the laboratory were about 1856 specially directed to the discovery of means for converting the soluble into an insoluble silicate, that would withstand the attacks of moisture, smoke, acid vapours, or saline influences. He bethought him of the mortar used by the ancients in buildings that have for many centuries resisted the attacks of the tooth of time, and he rightly judged that if he could produce the same binding and invulnerable agent—compound silicate of lime—in the structure of his stone, he would achieve a great success, inasmuch as he would then have a cement not only insoluble but such as would envelop and bind together indissolubly the particles of which the stone is composed. His pursuit of this object was zealous and unwearied, and a successful issue was at length attained. On the 27th September 1856 the inventor took out a patent for his process—to wit, for 'Improvements in the Manufacture of Artificial Stone, and in rendering it and other building materials less liable to decay.' His invention consisted in 'the application in succession of two solutions, which by mutual decomposition produce an insoluble substance, which is deposited in the substance and on the surface of the stone or other material.'

Under the direction of the eminent architect the late Sir Charles Barry, Mr Ransome applied his process to a portion of the river-front of the Houses of Parliament. It has also been applied, with uniform success, to numerous public buildings, mansions, and other structures. Twelve years after its application to the stone-work of the museums in Trinity College Dublin, it was officially reported as having 'proved most successful'; and similar testimony of its high excellence has been offered from various quarters both at home and abroad.

As a proof of his readiness to maintain the accuracy of his theory against learned contradiction, Mr Ransome procured a lump of magnesian limestone from the Houses of Parliament, pulverised it in a mortar, and by the application of his solutions, re-incorporated the particles into cubes that were much harder than the original natural

stone. At a meeting of the Royal Commissioners, appointed to inquire and report on the decay of the stone in the Houses of Parliament, Mr Ransome produced these cubes; and 'the result,' said Professor Kerr, 'was as we have seen. He astonished the doctors, and they accepted defeat. His own astonishment he kept to himself, and took out a fresh patent.' Specimens of this new production were exhibited in the International Exhibition of 1862, for which the jury awarded the prize-medal to the inventor. He was also awarded the prize-medal for his artificial stone by the jury of the Great Exhibition of 1851.

Dr E. Frankland, F.R.S., Professor of Chemistry at the Royal Institution, London, in December 1861 tested Mr Ransome's artificial stone, along with eight samples of the best natural freestones, for porosity, for degradation by immersion in acid solutions, boiling, drying, and brushing. The results placed the qualities of the artificial stone far above those of the natural samples. Mr Adam Sedgwick, M.A., Woodwardian Professor of Geology, Cambridge, pronounced it 'of good colour, and well fitted for solid walls or delicate architectural decorations. It is hard, and capable of resisting an enormous power of compression. . . . I believe it will be as strong and durable as the first-rate freestones found among the old strata of our country. This is my honest opinion.' Bramley Fall stone has been tested for resistance to crushing weight, which it has resisted up to 5120 pounds per square inch; Portland stone of the same sectional area has been crushed at 2630 pounds; whereas Ransome's stone has resisted crushing pressure up to 7145 pounds to the square inch. A four-inch cube of Ransome's stone, made for three months, has resisted crushing weight up to 63 tons.

Mr Ransome's process is based upon one of the most beautiful of chemical reactions; and his artificial stone is in its composition, mechanically and chemically, quite the same as that of the best building-stones known. It is perfectly homogeneous; and in its plastic state, in the earlier process of the manufacture, can be moulded into the most delicate forms, almost as sharp and clean as can be produced in metal. It is also tractable under the chisel, and is applicable to a great variety of uses severely utilitarian, as well as elaborately ornamental, from the blocks under steam-hammers to the splendid screens designed by Sir Digby Wyatt, and fixed on the end-walls of the Indian court at Whitehall. Thousands of grindstones have been manufactured of the material, and curiously enough, a large number of these have gone to Newcastle, the well-known producing and distributing centre for grindstones. Ransome's are prized by some of the great engineering firms there for their keen cutting properties, freedom from liability to clog, durability, and the absence of 'yolks' in their composition. The material has unsurpassed powers of resistance to the smoke and deleterious gases in the atmosphere of large cities and towns, to the influence of tidal alternations, of Indian summers and Russian winters, and of various other kinds of trial and attack, mechanical and climatic. Hence, the material has been extensively used abroad, as well as in London and the provinces, including amongst others, the India Offices, the London Docks, St Thomas's Hospital, the Brighton Aquarium, the Albert Bridge, Chelsea; and numerous churches and other public and private buildings.

Space will not permit of our enumerating even a few of the many difficulties this inventor had to encounter while toiling steadily to mature his work. To most men they would have proved insurmountable; but he was as fertile in resources as indomitable in perseverance; and although constantly confronted by much that was discouraging, he toiled on, studied hard, experimented untiringly to the extent of his knowledge, altering his processes as experience and fresh discoveries suggested. His progress was slow and painful, still it *was* progress; and at last his toilsome and meritorious labours have met with that success which perseverance in a useful cause invariably insures.

AN EVENTFUL VOYAGE

IN TWO CHAPTERS.—CHAPTER I.

At the time my story commences, I was one of six midshipmen on an Indiaman outward-bound for Calcutta, touching at Plymouth and the Cape. The vessel was one of the fine old frigate-build, with a high poop and top-gallant forecastle, and her main-deck was pierced for twelve guns. Her name was the *Bangalore*. She was built of teak, and was as strong as wood, copper, and iron could make her. The ship was owned by a well-known firm in London, and was chartered by government to take detachments of troops from Plymouth to Bengal. The captain's name, of which he was very proud, was Robertson Benbow. He was a middle-sized, bulbous-looking man, clean shaved, with both hair and whiskers plentifully streaked with silver. His complexion was of a rich, deep yellow, almost the colour of his own Madeira, a wine to which he was not impartial. He was between fifty and sixty years of age, and at Calcutta, was almost as well known as the Viceroy or Government House itself. He used to boast that he had in his time taken out and brought home the principal civil and military men in the country. Many of these had gone out to Bengal with him as young men, and returned with Old Bobus, as he was called, to retire on their pensions. Old Bobus was in his way a character; he was pompous in his manner, and very tenacious of his dignity, and had mixed so much in the society of civilians and military men, and others high in authority, that he had adopted not only their manners and customs, but even their mode of speaking, and was well posted up as to all appointments and promotions in the Bengal civil service. Below the rank of a commissioner, a colonel, or a judge, Captain Benbow seldom made free with any of his passengers; and young officers, or grills, as he called them, going out to India for the first time, were objects of his particular dislike.

The *Bangalore* seldom left Gravesend without two or three, sometimes half-a-dozen, young ladies being placed under the captain's charge, consigned to Calcutta; and he took as much care of them as though they belonged to himself. The ship was at Plymouth, lying in the Sound, and we were busily employed taking on board ammunition, fresh provisions, passengers' luggage, fresh meat and vegetables, prior to embarking the troops. We were to sail at two o'clock the next day, and the troops were to embark in the morning.

The name of the chief officer was Blake; he was a little square-built man, with a large Roman nose.

He was forty years of age, and was the echo of the captain, with whom he had made several voyages.

Mr Sparks, the second officer, was the very opposite to the chief. He was a red-haired man, with a gravel-colour complexion, and whiskers to correspond. He had a bullying way with him, and a violent temper, and possessed a voice that was perpetually heard fore and aft all over the ship. Though rough and ready, Roaring Sparks, as he was called, was the smartest officer and best seaman on board.

In addition to the third and fourth officers, there were besides six midshipmen, who were learning their profession on board this vessel; and the senior of these was a remarkably well-built, stylish-looking young fellow of nineteen, with a profusion of dark wavy hair, and a pair of very piercing dark-brown eyes. He was a clergyman's son, and had been partly educated at the Royal Naval College at Portsmouth, his only brother being a lieutenant in the service. It was said that Vaughan had left the college prematurely, through being expelled, but for what reason I never heard. Although not twenty, there was scarcely a vice with which this youth was unfamiliar; but withal, he had talent, humour, and wit. His manners were frank and engaging, and his bearing peculiarly graceful, and he had also great determination; but of power to regulate his passions he was entirely destitute. Vaughan had been nearly four years at sea, was a capital yachtsman, and from infancy had been familiar with nautical matters.

While off Mount Edgecumbe, we embarked about six hundred troops, chiefly detachments for service in India, a number of officers, a judge, and about a dozen ladies; some of these were going out to rejoin their husbands, and others were the wives of officers on board. The commanding officer was the Honourable Colonel Boyle, who had seen service in the Crimea, and was going to join his regiment at Dinapore. He was accompanied by his wife, who was very thin and tall, and generally carried a small walking-cane. The lady was attended by an ayah, and was more military in her conversation than the oldest soldier on board.

The morning of the day we got under way was beautifully fine, and Vaughan was on duty at the gangway, and the troops were expected on board in the afternoon. It was ten o'clock when a man-o'-war's gig came alongside; and escorting a very stylish young lady up the gangway ladder was an elderly gentleman in the dress uniform of a post-captain. On reaching the gangway, he saluted Vaughan, and asked: 'Is Captain Benbow on board?' but just as Vaughan was about to reply, Old Bobus himself appeared, and the naval officer whose name was Nugent, stepped forward and said: 'How are you, Benbow? Glad to see you here again—wish I was going passenger with you. Allow me to introduce you to a very charming young lady, who has just completed her education, and is going to join her father in Bengal. Miss Talbot, Captain Benbow.'

'What!' exclaimed the captain; 'the daughter of my old friend, the judge at Moorshedabad?' Old Bobus looked at her for a minute, and took her hand in his, and said: 'When you were a very little girl, and could hardly speak a dozen words, I brought you home. Twenty-one years ago I

took your father out to Calcutta, when he had been appointed by the India House; and I took your mother out to him in the *Taj Mahal* to be married. Bless me, how the time gets on!' Then turning aside to her guardian, he continued: 'You should have seen her mother, Nugent; she was a perfect picture! The first time she was presented at Government House, in Lord Auckland's time, I was present. She seemed so pretty and fresh, and had such a silvery, hearty laugh, that every one was in raptures about her. The natives all thought she was a goddess.'

'You will have another acquisition at Government House,' said Captain Nugent, 'or I am much mistaken.'

Old Bobus then proposed to shew them his ship and all its wonders; and Miss Talbot and Captain Nugent assenting, he led the way.

Miss Talbot was a bright blonde, with large violet eyes and a charming little mouth, and absolutely perfect figure. She had not been on board more than a few hours before she was the centre of attraction and admiration of all the military officers on board, and was evidently envied by the ladies, especially the younger ones. Her father was a judge in an important district, and had been brought up at Haileybury with Captain Benbow's brother. The judge's wife had died fifteen years before at Calcutta, of cholera, after a few hours' illness, leaving the judge with an only child, his little daughter Blanche, who had been sent home with an ayah and an English nurse, in Captain Benbow's charge, when he commanded the *Taj Mahal*. An aunt at Bath, sister of the judge, had undertaken the charge of the motherless girl until her education was completed.

Miss Talbot, at the time of her setting foot on board the *Bangalore*, was about eighteen years of age. Captain Nugent having inspected the vessel, went into the cuddy with Captain Benbow, and in a glass of his famous Sercial Madeira wished him and the young lady a pleasant voyage. Having called for his boat, he took his departure; but before going down the ladder and shaking hands with Old Bobus, he carelessly remarked: 'That is a smart-looking youngster at the gangway, Benbow.'

'His father was chaplain in the service with Dundas, and asked me as a favour to take him.'

'Ah, well, I hope he is as good as he is smart,' added Captain Nugent. '*Bon voyage*.'

No sooner was he gone, than the captain called for the carpenter, and gave immediate orders for the fitting up of Miss Talbot's cabin, which was the next to his own. Until that work was accomplished, both the carpenter and the stewards had but a sorry time of it.

The steam-tug came alongside with troops, and then with baggage. With the troops were some passengers who joined at Plymouth. It was a Saturday afternoon, about 2 P.M., when we hove up anchor and got under way; the wind was moderate from south-east, and the weather beautiful. We had all plain sail set, and sailed slowly out of the Sound, and were soon out in the open channel, with the Eddystone lighthouse on our starboard quarter. All hands had been hard at work securing boats, lashing spars, and getting the anchors on board and making all snug for sea. It was a beautiful evening, and the quartermaster had

struck eight bells. The watches had been set, and before the starboard watch went below, Vaughan hove the log. The poop was crowded with passengers, when Mr Sparks, who was in charge of the deck, inquired at what rate the vessel was going, whereupon Vaughan replied: 'Seven knots, sir.'

The second mate laughed sneeringly, and in his off-hand way said: 'Tell that to the marines.'

'Tell them, then,' said Vaughan, 'and leave it yourself.'

Here two or three passengers who were watching the proceedings laughed. Mr Sparks called the after-guard, and hove the log, and then declared that the vessel was barely going six-and-a-half; and turning to Vaughan, ordered him off the poop, saying that he should report his behaviour. He did not forget his promise; and the chief officer at once sent for Vaughan, and after severely reprimanding him, told him that unless he immediately apologised to Mr Sparks, he would report him to Captain Benbow. Vaughan did apologise, but did it in such a manner that it only seemed to aggravate the offence. From that night there seemed to be a feud between Vaughan and the second officer, which increased daily; and, to do him justice, Mr Sparks lost no opportunity of shewing his authority; but that did not mend matters. When Vaughan came into the cockpit, he said: 'If that second mate thinks that I am to be running-footman to him, he will find himself mistaken; and if ever he strikes me—it will be the worse for him.'

In fine weather, Old Bobus made his appearance on the weather-side of the poop, dressed in a blue frock-coat, white waistcoat, with treble gilt navy buttons. He wore very high shirt-collars, and a large black silk tie. His linen was irreproachable. He always wore gloves, and a black silk hat minus the cockade, like an admiral. In the forenoon he would parade the quarter-deck, sometimes in company with the judge, sometimes with the colonel and his wife, and very often with his ward, Miss Talbot, of whom he appeared very proud. He would never tire of telling her anecdotes about her parents, besides stories by the score of half the people in Chowringhee. Among the lady passengers on board there was a Mrs Silver, who was going to rejoin her husband, who was captain in a Ghooorka regiment. She flirted desperately with the military officers on board, and especially the sub-alterns, who spoke of her as a nice creature. Miss Talbot, when on deck, was generally the companion of Mrs Boyle, the colonel's wife, who seemed to have voluntarily undertaken the part of chaperon. The two ladies used to sit on the lee-side of the mizzen-mast in their deck-chairs, and Captain Stammersleigh, who was an experienced hand and thorough ladies' man, would often read Byron or Tennyson to them. As for the junior officers, they were to a man smitten with Miss Talbot, and all anxious to pay their respects and shew her attention. She was equally fascinating to all, without shewing preference to any.

On Sunday it was the custom on board the *Bangalore* for the captain to invite one of his officers and two midshipmen to dine at the cuddy-table. When Mr Vaughan was asked, he not only shewed a joyous alacrity in accepting the invitation, but also in decorating himself for the occasion. It was upon one of these occasions, when Vaughan

was dining in the cuddy, that the conversation turned upon theatricals and charades, and Captain Hastings, who had had much experience in these matters, proposed that they should get up a charade or play, and finally, proposed to select one if Miss Talbot would take a part in it.

'All we want,' continued Captain Hastings, 'are a couple of scenes.'

'I hear,' suggested Mrs Boyle, 'that Mr Vaughan, among his other accomplishments, is very clever with the pencil and brushes.'

Mrs Boyle took up the matter promptly; and her pressure and that of the other ladies being put upon Old Bobus (that officer being secretly only too glad to keep his passengers amused), gracefully consented to allow Mr Vaughan to paint the scenes, saying, however, that he must not waste too much time upon them. A piece was soon selected by Captain Hastings, and approved by Mrs Boyle and the other ladies. While the scenes were being painted in the stern-cabin, and dresses planned and discussed, Vaughan, with his easy flow of conversation and engaging address, contrived to get Mrs Boyle much interested in him; and as that lady was usually accompanied by Miss Talbot, it was no wonder that she too, being very romantic and fresh from school, took much notice of him. He designed this young lady a very pretty costume, and found a sempstress among the soldiers' wives to make it up. The piece selected was *The Lovers of a Lover*; and Vaughan seemed to know more about it than the stage-manager, Captain Hastings. Mrs Boyle was frequently called away to be consulted by him and the other ladies who were taking parts in the piece, and the consequence was that Vaughan and Miss Talbot were much left together. 'It was,' said Mrs Boyle, 'such a pity that such a superior young man should not have a better profession to follow than that of the sea; or, at all events, if he did follow it, why did not his friends get him a commission in the navy?'

At seven bells it was customary for all the midshipmen to muster on the poop with their sextants, for the purpose of making observation of the sun's altitude; and directly after giving the quarter-master the order to strike eight bells, it was Captain Benbow's custom to retire to his stateroom and work out the latitude; and one of the midshipmen—lately, Mr Vaughan—had taken it upon himself to take in the log-slate with the dead-reckoning worked up, as the passengers were assembling at the cuddy-table for tiffin.

On these occasions, after he had finished attending to the captain, Mr Vaughan frequently met either the colonel's wife or Miss Talbot, who did not scruple to ask him about the position of the vessel, or how the scenes were progressing. On one of these occasions, Vaughan, amongst his other sketches, exhibited a very spirited water-colour in miniature of the scene he was preparing.

'How very nice!' said Miss Talbot; and Vaughan thereupon asked her to accept the sketch as a souvenir of the voyage. The young lady did so, and declared that directly she arrived in Calcutta, she would have it framed. While Miss Talbot was examining the drawings, suddenly one dropped from the side-pocket of the portfolio; and as she picked it up, she coloured deeply, as, on looking at it, she recognised a sketch of herself. 'Who is that?' she said naïvely.

'It is an endeavour to realise a dream,' replied

Vaughan; and the young lady coloured again, but made no reply.

These apparently accidental interviews occurred once, twice, and sometimes oftener every day. That Miss Talbot was interested, not to say partial to Vaughan, was no secret on board to nearly every one, except the colonel's wife and Captain Benbow. These worthy people considered that with a young lady under their protection wrong-doing or indiscretion of any sort was impossible. It was in vain that Stammersleigh, Cager, Parker, and all the younger military men paid her the most assiduous attention; theirs created not the slightest impression.

On one occasion, little Farquhar, the junior subaltern on board, after declaring to Cager and several others who were in his cabin that Miss T. was really the only girl he had ever cared for in his life, got so chafed for his pains, that he resigned himself to melancholy, and consoled himself for the remainder of the voyage with a favourite meerschaum, consuming tobacco almost sufficient to unsettle the nerves of a rhinoceros.

Although they never appeared to speak to one another on deck, yet, whenever Vaughan made his appearance there, Miss Talbot would change colour, and appear to be deeply absorbed in her needle-work or book. She now seldom walked the deck with Captain Benbow, and astonished that commander by telling him that he rolled so that she could not keep step with him.

There is an axiom founded on experience, that what a man has steadily set his mind upon doing, he is sure to do. He may have to wait for years before the opportunity arrives, but if his mind remain fixed in the same direction, that opportunity will assuredly come. I mention this, as Vaughan—though carefully attending to the navigation of the vessel—seemed like a man who was working out a scheme. At night, when it was his watch on deck, he would often steal down to our berth, and, taking down the cockpit lantern, would bring his writing-pad, and write a little note in pencil. After writing one of these, he would very often destroy it, and commence another. We were now getting down to the southward, and hoping in a very few days to be in the latitude of the Cape.

About a week after I had first seen Vaughan writing those notes, it was a dark night, and raining heavily; it was his middle watch on deck. He was in the starboard-watch with the second mate. The watch were setting a topmast studdingsail, and were shouting as they hauled on the halyards. It was about 2 A.M. when he rushed into the cockpit with his oilskin on, and taking down the battered old lantern which was suspended from the deck, carefully opened a little pink cocked-hat note, and read it over several times, smiling and looking very pleased as he did so. At last, he tore it up, carefully putting the pieces into his pocket. He then produced from his waistcoat another little paper, from which he took a lock of pale Saxon hair, and this he deliberately tied round with a piece of blue silk thread, and kissed; then opening the locket he always wore round his neck, he inclosed the lock of hair, and replaced the locket round his neck. He was absent from the deck about ten minutes, and had just rehung the lantern in its place again, and was going on deck, when a stentorian voice roared out:

'Skulking again! Come out, you scum of a fish-pond, and go and loose that main-royal;' and at that minute the head and shoulders of the second mate appeared enveloped in oilskins. He was crimson with rage, and loudly added: 'I've put up with your monkey tricks long enough.'

'If you are speaking to me, I should advise you to adopt a different tone,' said Vaughan. 'Recollect that you are not in the fore-castle now, though it certainly is your proper place.'

Although Vaughan appeared to be cool, he was evidently in much the same temper as the second mate, who sang out: 'By Jove! I'll make you swallow those words;' and with that he rushed in and seized Vaughan by the collar, and dragged him on deck.

'I'm ready for you,' said Vaughan, and giving a sudden spring, closed in with him like a tiger.

They were now both locked together, reeling and scuffling, and each trying to strike the other. Though very active, Vaughan, in strength, was no match for the second mate, who was the most powerful man in the ship's company; and it was evident that Vaughan was getting the worst of the encounter, when in his passion he suddenly made a spring and snatched a belaying-pin out of the rail, and quick as thought, struck Sparks a fearful blow with it across the forehead. The second mate dropped senseless on the deck, smothered in blood, and the scene of confusion that ensued baffles description. Clere, the fourth officer, followed by several of the watch, rushed up to stop Vaughan; but he stood at bay, with his back to the bulwark, and ejaculated: 'Stand back, or I will give any man the same who dares to lay a finger on me.'

Sparks was carried by Clere and some of the watch, unconscious to his cabin, with his head bound up in a silk handkerchief; and the doctor, who had been called out, had some doubts at first whether his skull was not fractured. It was some hours before he came round; and several days elapsed before he was able to appear on deck again and resume duty, and when he did so, he was marked and disfigured for life.

When this incident occurred, it was about half-past two in the morning. All the passengers and troops were below and asleep in their cabins. The chief officer was not very pleased at being disturbed from his watch below; he was, however, quickly on deck; and after calling up Vaughan, and hearing his statement, ordered him off duty, and kept the remainder of the watch himself until Captain Benbow should come on deck.

As eight bells were sounded in the morning, Captain Benbow made his appearance on deck, clean shaved, his clothes well brushed, and looking as fresh and bright as though he had enjoyed his night's rest. He was in a very good-humour. The watch had finished washing the decks, and were coiling down the ropes, when Mr Blake reported to him the particulars of the encounter during the middle watch, and also stated that he himself of late had been dissatisfied with Vaughan's conduct; that disrespect to the officers of the vessel was a bad example to the crew, and if not effectually checked, would be subversive of all discipline on board.

Old Benbow listened attentively, for he had a great opinion of his chief officer; and then getting very red in the face, said: 'Of course, of course!

Why, it's mutiny—rank mutiny—and by a youngster too. Send in that fellow to my cabin at once.'

When called up, Vaughan, in his defence, said that from the very commencement of the voyage the second officer had systematically persecuted and bullied him, till at last, in a moment of passion, when assaulted in a cowardly way by him, he had attempted to defend himself, and that Mr Sparks' wound was more the result of accident than design. He then detailed Mr Sparks' language to him, and also repeated his former statement, that he would not allow any man on board to lay a finger upon him. He had no sooner made this unlucky speech, than Captain Benbow, with the air of a judge, said: 'Silence, sir! If you dare to speak to me in that tone, I will have you put in irons at once. I did expect better things from you; but since you have chosen to mutiny on my ship, and strike one of my officers, you must take the consequences; and as you don't know how to behave as a gentleman, you must live in the fore-castle, and do duty before the mast as an ordinary seaman; and I caution you that, should I hear of any more assaults by you on my officers, I shall have you put in irons, and hand you over to the police at the Cape.'

Vaughan was beginning to reply to his sentence, when the captain said: 'Go forward, sir; I never allow replies. Go forward, and do your duty.' He then gave an oration on discipline to the officers and midshipmen assembled, which he said he would have maintained on any vessel which he commanded, or know the reason why! He then dismissed every one but the second officer, whom he severely reprimanded. 'Coarse manners, execrations, and abusive language,' said the captain, 'render men discontented, and degrade the officers, no matter how good they may be as seamen; and I trust, Mr Sparks, that I shall not a second time have to speak to you on this subject.' Sparks was about to reply, when Captain Benbow reminded him that he never allowed replies from either officers or men, and desired him at once to return to his duty.

NEST-BUILDING FISHES.

ONE of the most common of our British fishes, the tiny stickleback, has attracted considerable attention on account of its curious habit of building a nest—rivalling in intricacy the homes of our feathered friends—in which it deposits its eggs, and over which it keeps watch and guard till the tiny family are able to enter on the responsibilities of stickleback-life. Such precautions are unusual among the finny tribes, whose eggs are generally left to chance, or, in some cases, adhere to friendly weeds till they hatch out, and the young ones face life in the world of waters, without a parent's care to guide them. The lovely salmon makes an apology for a nest by scooping out a hollow or 'redd' in the gravel bed of the stream which it ascends for the purpose; but this, compared with the beautiful workmanship of the stickleback, is as the rook's collection of sticks to the mossy ball prepared by Jenny Wren for her bantlings.

The instances of nest-building fishes are rare, and it is among tropical species that the majority of them occur. One of these—whose lovely colours have caused it to be christened the 'rainbow fish'

—has lately been introduced in limited numbers into Europe, where its beauty has created quite a *furor* amongst the aquarium-keepers, and where it excites additional interest on account of its possessing the peculiarity of building a nest for the reception of the eggs. Probably the first person who has watched the whole of this operation was Monsieur Carbonnier, a French naturalist, who lately gave an account of his observations before the Paris Acclimatisation Society.

As in the case of the stickleback, it is the male fish which performs the principal duties of nurse and cradle-keeper; but the nest of the rainbow fish differs from that of the stickleback in the fact that it floats on the surface of the water, whereas the latter is built among the weeds beneath. The approach of breeding-time is marked by the increasing beauty of colour in the male fish, who dons his best robes in order to find favour in the eyes of his mate. His scales then assume all the varied tints of the rainbow, every movement causing them to scintillate with a metallic lustre and ever-changing hue, now flashing forth with increased splendour, now dying away for a moment, only to reappear with greater variety and intensity of colour.

But his time is not all given to courting. He enters on the duties of his prospective position with vigour; and his instinct, amounting almost to sagacity, is thus exemplified in Monsieur Carbonnier's narrative. The weeds growing in the aquarium in which some of his specimens were confined were of a kind which would not float. The fish tore off bits of the leaves in his mouth, and expelled them towards the surface; but their specific gravity was too great, and his efforts were unavailing. Monsieur Carbonnier, with a quick perception of the fish's wants, replaced the plants with others of a finer texture, and then had the pleasure of seeing the fish renew its attempts with complete success.

But the fish was too cunning an architect to trust to the natural flotation of his building materials, and after placing a few pieces together in position, he formed several air-bubbles in a viscid secretion, which he was able to eject from his mouth, and placed them in contact with his floating nest. Just, in fact, as engineers among ourselves have proposed to raise the *Vanguard* by means of immense air-bags, the rainbow fish, wiser than ourselves, formed his air-bags and attached them to his ship as a precautionary measure, to prevent its sinking from natural instability, collision with piscine *Iron Dukes*, or other untoward causes.

Day by day the work of knitting together the little morsels of weed progresses, till a floating domed island three inches in diameter is formed (the fish itself is not more than half that length); but this is, so to speak, only the foundation of the edifice, the roof being in reality constructed before any other part. Beneath this roof a complete circular nest is built, which the fish welds together with the greatest industry and patience; and not till it is complete does he seek his companion. All this time the female has kept aloof, neither assisting her companion nor encouraging him by her presence in the work of nidification. But now she is induced to visit the home of her future progeny, and the labours of the exemplary parent are redoubled. When the minute eggs

are laid, he collects them in his mouth, and places them carefully within the nest, which he continually supports with fresh bubbles, lest the precious cargo should overweight it. When all is safe, he stations himself on guard before the only opening in the nest, and awaits the course of events, ready to defend his handiwork against all comers, while his better-half retires altogether from the scene. In about three days the eggs begin to hatch out. The parent fish then destroys a number of the supporting air-bubbles, causing the nest to sink deeper into the water, so that none of the young ones may be 'drowned' for want of water. As long as he can, he prevents them from escaping from the paternal roof—the title is hardly appropriate, however, for neither father nor mother has inhabited the house: but their strength rapidly increases; and, just as boys and girls leave home to better themselves, the young rainbow fish burst from the father's apron-strings and are soon exulting in their new-found freedom.

MATCH-MAKING IN ROSCOMMON.

In the west of Ireland, the feelings of the young woman are seldom consulted in matters matrimonial. Her father being the best judge of what is for his daughter's advantage, opposition on her part is of very rare occurrence, except where she has taken the precaution of providing herself with a husband beforehand. When a match is made and the bargain concluded, if the girl declines to accept the husband selected, she quickly loses caste, the young men considering that a disobedient daughter must of necessity make an uncomfortable wife.

Still more exceptional is any objection on the part of the young man to the wife selected for him by his father, as he feels quite satisfied that experience enables his parent to judge of the temper and qualifications of a woman much better than he possibly could. Moreover, the father has the advantage of being able to examine her merits with a perfectly impartial and at the same time fairly critical eye. Interest and inclination alike lead him to make the best selection; he does it only after an infinite amount of cogitation; but when his choice is made, it is unalterable; and he will obstinately contend for his son's interest, without a single thought of the young woman's inclinations, taking it for granted that they will be in accordance with her father's wishes. The mother has little to say in the matter on either side. She never goes match-making, and is not in any way consulted, being only acquainted with the intentions of her husband for their son, when he has made up his mind. Marriage is a matter of business, and it is like any other bargain, made with the shrewd humorous calculating caution which characterises the Connaught man. Marriage gifts such as pigs, poultry, a cow, &c., play an important part in the arrangements; and the girl's father has been known to refuse to give her a single penny of fortune until the bridegroom's parent had conceded to her a favourite hatching goose! The following is a specimen of the way in which matrimonial affairs are managed west of the Shannon.

'Get out my Sunday clothes, Judy,' said old Corny O'Byrne, one evening when he returned from

his work. 'I'm goin' over to Pether Linskey's to-night.'

'Musha, Corny, an' what are ye goin' for?' Judy asked, as she unlocked a large deal-chest painted red, which stood near the fire-place, and carefully took out a blue frieze tail-coat, with bright metal buttons, a pair of light-coloured cord knee-breeches, ribbed worsted stockings, a pair of strong shoes, and a billycock hat, which, with a red cotton pocket-handkerchief with a flowered border (which he carried in his hat), and a stout blackthorn shille-lah, constituted Corny's Sunday suit.

'Sure, I'm goin' to make a match between our Dermott an' Katie Linskey,' he said at last in reply to his wife's question. 'She's a purty colleen, an' the boy is mighty plased with her, intirely.'

'So she is, Corny, a lankie little girl, an' she'll have a sung fortune, maybe. Pether is a decent honest man!'

'Faith, Judy, an' he is that same, or it isn't Corny O'Byrne that would "cut, shuffle, or dale" with him or his; an' Dermott tells me Katie likes him.'

'An' why wouldn't she, Corny? There's not as purty a boy in the parish; nor a better,' Judy said proudly.

'Thrus for ye, asthore: give us out the ould stockin', an' we'll make a match of it this Shrove-tide, with the blessin' o' St Pathrick!' Corny replied.

From the furthest corner of the chest, Judy drew out carefully an old worsted stocking, and handed it to her husband, who weighed it in his hand, and then, with a sly wink, buttoned it into one of his pockets. 'This'll do the business, Judy,' he said, as he left the house, with many *Banoughth-Laths*—God prosper, or be with you—from his wife.

Peter Linskey was a small farmer living about a quarter of a mile from Corny's cabin. He had several sons, and one daughter, Katie, who was considered the 'beauty' of the village of Ballymoynce. Her eldest brother was about to be married, and bring his wife home; and her father considered it would be very advisable to get Katie married and settled before the arrival of her sister-in-law; and Dermott O'Byrne—a fine, strapping, young fellow, very 'steady' and good-natured—Old Peter thought would make a very good husband for his girl (especially as he was an only child), if no better suitor offered.

When Corny O'Byrne reached Peter Linskey's cabin, he put in his head over the half-door, and said in Irish: 'God save all here!' the customary form of greeting in that and many other parts of Ireland.

'God save ye kindly, Corny,' Peter replied from the chimney-corner: 'come in and take a sate.'

Corny entered with both his hands behind his back, took his seat on a three-legged stool that Mrs Linskey had pushed in front of the fire for him.

'Fine weather for the crops, Corny,' Peter said, poking up the fire with his shoe. 'An' Mary, throw on a couple o' sods o' dry turf, an' sweep up the hearth, will ye?'

Mary did as her husband desired; and then going to a recess in the wall by the fire-place, took out from thence a new clay-pipe and piece of tobacco (probably got at the last wake she had been at). 'Will ye light the pipe, Corny?' she said, handing them to the old man, who took them with a nod

and 'Thankee kindly,' and filled slowly, kindled with a coal from the hearth, blew a few whiffs in grave dignified silence, and then handed it to Peter, who in equal silence smoked it for a few moments, and then handed it back to Corny, and proceeded to light his own pipe.

They both smoked steadily for a time, then Mrs Linskey pulled a small table between them, produced from her chest a stone jar of potheen, and a couple of cracked glasses, which she set on the table with a noggin of cold water; and taking up her pail, proceeded to the barn to milk the cows.

'That's a purty colleen of yours, Pether!' Corny said after a long silence.

'Thine for ye; an' a good, sensible, little girl into the bargain: it's happy's the man that'll get her,' Peter replied, after due consideration.

'That's what I said myself; an' I come over to see if we can't make a match between my Dermott an' herself!' O'Byrne said after another interval.

'He's a likely boy,' pursued Peter reflectively.

'Ye may well say that, Pether; an' he'll make a good husband, no doubt, for he's a good son. What do ye say to it?' Corny asked, leaning forward on his stool.

'I'm pleased'—

'God save all here!' said a harsh grating voice, and a head appeared in the doorway: 'Good-evening to ye, Pether!'

'Good-evening, kindly,' Peter returned. 'Come in and take a sate, Tom.'

The new-comer entered, and took a stool, and casting a questioning glance at Corny O'Byrne, proceeded to light his pipe, and smoked for some minutes. He was a stout, harsh-featured man, with a loud voice. He was not much of a favourite in the village—and especially disliked by Corny O'Byrne—who never lost an opportunity of annoying Tom Dillon. He was a comfortable farmer, and one of his sons had been 'making up' to Katie Linskey some time before. After a silence, during which the three old men smoked energetically, Dillon cleared his throat two or three times, and then said abruptly: 'Pether, I want to make a match between your little girl and my Martin; have ye anything to say agin it?'

'Sorra one word, Tom; only me neighbour Corny O'Byrne an' myself were speaking o' the same thing when ye come in!' Peter replied, with a shrewd glance at them both.

'First come, first served, Pether,' Corny said, shaking the ashes from his pipe, by knocking the bowl against his thumb-nail; 'mind that!'

'To be sure, to be sure,' Peter replied; and there was another long pause.

'An' we may as well clinch the bargain at onct,' Corny continued.

'To be sure, to be sure,' Peter again assented, smoking steadily.

'Ye have nothin' agin my Martin, have ye, Pether Linskey?' Tom Dillon said, laying down his pipe.

'Agin him? No; he's a nice decent boy, an' I have a great regard for him,' Peter answered.

'An' he has a great regard for your little girl, an' sorra a day's good he'll do till he's married,' ejaculated Tom, bringing his fist down on the table. 'He set his mind on it, an' I'll back him out!'

'Turf an' tundther! Tom Dillon, didn't Pether Linskey tell you I came match-making for my Dermott?'

'Tundther an' turf! Corny O'Byrne, don't I tell you that I come to do the same thing for my Martin; an' I suppose a Dillon may ask a Linskey in marriage any day—an' he can afford it too!' Tom added, slapping his pocket.

'An' let me tell ye, an O'Byrne can put down pound for pound with a Linskey any day; or, for that matther, with a Dillon,' Corny said, with a scornful glance at Tom, who was in his working clothes.—'Pether,' he continued, 'ye know what I came for; what fortune are ye goin' to give Katie?'

Peter took out his pipe, emptied it, proceeded to refill it leisurely, poked the fire, relit the pipe, settled himself back in his corner, and said slowly: 'Fortune, Corny! Katie is a fortune herself. I'm a poor man, an' the times is bad; an' beyond a new gown, a couple of fleeces of wool, an' a hank or so of yarn, I can't give her any fortune!'

Corny looked astonished, and pushed back his stool, as much as to say that all further negotiations were useless; when Tom Dillon said: 'Never mind, Pether; there's them as'll be willin' to take her without any fortune, an' an' afford it too!'

'Thine for ye, Tom Dillon, an' one o' them is Dermott O'Byrne. *We're not dependin' on a few bare pounds—not but what it's well to have something to put by for the childer;*' he added cautiously.

'To be sure, Corny, to be sure,' Peter assented.

'Well, Pether, is it to be me or Corny? Is a Dillon to be put behind the door for an O'Byrne? Isn't my Martin as likely a boy as there's in the barony? He'll take your colleen without a brass penny, an' do well for her. What do ye say to that?' Tom asked, slapping the table.

'Bedad, then, Tom, I'm in a fix intirely. Here's Corny, a decent old man, with a fine steady gossoon of a son—he's first; an' here's yourself, an honest man an' a good neighbour sorra better—an' sure Martin is the pride of the parish on a Sunday! I'm bothered intirely, an' *what can I say*, but settle it betune ye! Whichever of ye can do the best for her, take her, in the name of St Patrick!' and Peter resumed his pipe, and snuk back into his corner.

The two old men eyed one another silently for a few minutes, then Dillon pulled a little bag from his pocket, opened it deliberately, and took out another, from which he drew forth a third, made of purple stuff, fastened with a piece of red braid. Very slowly, his eye still fixed on Corny, he pulled out a sovereign, and laid it on the table. 'Shew Pether Linskey what ye mane to do, Corny O'Byrne,' he said.

Corny smiled scornfully, produced his old stocking, and taking from thence a five-pound note, put it beside him, and nodded his head defiantly. Tom drew forth four more sovereigns, clinked them one after another on the table, and nodded his head. Old Peter smoked away in his corner without uttering a word.

Corny waited for a moment, and then said: 'Is that all you're goin' to do, Misther Dillon?'

Tom threw down another sovereign—Corny followed his example, till they had each laid twenty pounds upon the table.

'Is that all you're goin' to do, Misther Dillon?' Corny repeated.

'In ready-money, it is, Misther O'Byrne.'

'Then I bate ye at that!' Corny cried, throwing down another pound.—'I bate him in cash, Pether; do ye mind that?'

Pether nodded, and smoked away.

'I'll take the girl in, an' share the best we have with her, an' give Martin two acres of land, an' a couple of *bonives*' (little pigs), announced Tom Dillon.

'Dermott 'll have my land when I'm gone, every rool,' cried Corny.

'I'll give a heifer in! Twenty pounds, share of a house, two acres of land, an' a heifer.—What do ye say, Pether?' Tom cried. 'Not bad for a colleen without a penny!'

'Thrus for you, Tom,' Peter assented.—'What 'll you do, Corny?'

'Twenty-one pound—down, the day they're married, a house an' home, a feather-bed, an' the finest mule in the parish—that's what I'll do!'

'But the land—Tom is giving two acres,' Peter observed: 'think of that, Corny!'

'Dermott 'll have the land afther me, an' enough to eat of it till I'm gone. I have no one but him. Tom Dillon has three more to provide for!'

'An' plenty to do it with; an' I'll make it three acres, Pether, of the best upland in Ballymoyné?' Tom replied.

'It's very fair, an' I'm obliged to ye, Tom,' Peter said slowly.

'I'll make it twenty-five down, an' throw in a heifer!' Corny cried.

'It's very decent, Corny, an' I'm obliged to ye,' Peter quietly observed in the same tone.

'I'll throw in a calf!' exclaimed Dillon. 'Twenty pound, three acres of land, a bonive, a heifer, an' a calf. Now, Pether—done or not?'

'I think ye spoke of two bonives, Tom?' Peter said quietly.

'No, no; only one. It's all I can spare; an' I think it's not bad, Pether!'

'Bedad, Tom, I think ye said a couple of bonives,' Peter said again.

'*Nabackish* [never mind], Pether. I'll throw in a *clutch* [a whole brood] o' ducks—take it or lose it! Twenty-five pounds down the day they're married, a house an' home, a feather-bed, a fine mule, a heifer, an' a clutch o' ducks!' said Corny, putting his money back into his stocking.

'Faix, an' a clutch o' ducks isn't bad,' observed Peter. 'They're better than a calf to them that hasn't a cow to feed it; an' Corny's is the best house, an' Katie 'll have it all to herself. When your Matt an' James marry, it'll be mighty narrow for ye all!'

'James is going to America, Pether,' said Tom.

'Well, that makes a differ. But isn't there anything else yer inclined to offer? Dermott is the best match at this minute!' observed Peter.

'I'm done!' said Tom. Then suddenly starting up, he cried: 'Wait a minute;' and ran out of the house, returning in a quarter of an hour, staggering under a great sack of seed-potatoes. 'There! Corny O'Byrne; put *that* in yer pipe an' smoke it!' he cried exultingly.

Corny, at first sight of the sack, started to his feet, and put on his hat. 'Wait a minute, Pether,' he cried; 'I'll not be long'—and running all the way home, he was soon there.

'Get me a sack, Judy—the meal-sack—an' be quick, *asthore*!' he cried excitedly.

'Arra be aisy, Corny, shure an' the male is in it.'

'Betther an' betther,' cried Corny, going into the room which served as dairy; and without vouchsafing another word to the astonished Judy, he shouldered the sack, and trotted off with it as fast as he could.

Completely out of breath, he reached Peter's, bathed in perspiration; but on entering, he unluckily tripped over the door-step, and fell with the sack full length into the kitchen. The string round the neck of the bag gave way, and covered with the meal, he groaned and stammered breathlessly: 'Th-ther, Pe-pe-ther Lins-ke-y! Wh-while the *praties* was gr-growin', the meal woud keep them alive! W-what d' ye say, Pe-pether?'

'Begorra, Corny, I say what I often said before, that yer a decent man—an' yer boy is welcome to Kate Linskey.'

'What do ye mean, Pether?' cried Tom Dillon.

'What I say, Tom; nor a more nor less. The childer might die o' the *faregurth* [a fainting brought on by hunger, or over-fatigue without proper sustenance] while the *praties* was growin'. Dermott O'Byrne can best provide my little girl with comforts, an' he's welcome to her.'

At that moment a merry laugh caused the three old men to look round, and Corny tried to scramble to his feet. In the doorway stood Katie Linskey, her hands pressed to her sides, and tears of mirth coursing down her pretty face. 'I'm sorry for your trouble, Corny,' she said, advancing; 'but I could not help laughing, you looked so quare;' and she burst into a fresh peal.

'Be quiet, Katie, an' come here,' said Peter, beckoning his daughter to his side. 'I was match-making for ye; an' the bargain is closed betune me an' Corny for you an' Dermott O'Byrne!'

'Ye don't mane it, father!' said Katie with a comical glance at Corny and Tom Dillon.

'Shure enough, I do, ma colleen; have ye anything to say agin it?' replied Peter, knocking the ashes from his pipe.

'Musha, not a word at all, father dear; only—only!'

'Only what, Katie?'

'Only, I was married last Tuesday to Jack Mangan the painter!' she replied with a loud musical laugh, which brought her husband to the door.

'What!' shrieked Tom Dillon.

'What!' echoed Corny.

'Oh, Pether Linskey, Pether Linskey, yer afther humbugging us!' cried Tom reproachfully.

'Ay, humbugging us!' echoed Corny mournfully; and Peter, who was a sly old humorist, put his head against the wall, and laughed heartily at their astonishment.

The two ambassadors silently took up their respective sacks, and slowly departed, each thinking himself much injured, and in their mutual discomfiture forgetting their animosity. As for old Peter, he was only too well pleased to have his daughter well married and off his hands without even the 'new gown' or the priest's dues—though he could afford to give her a good fortune—as good fortunes go in that part of the country.

When next Corny went 'match-making,' he took care to find out beforehand if the young woman was 'willing;' and as for Tom Dillon, he vowed it served him right to be 'humbugged,' as he only

wanted to bother his neighbour, Corny O'Byrne (with whom he was ever after good friends), and he declared that in future his 'boys' might match-make for themselves.

A PECULIAR PEOPLE.

UNDER the inspirations of a diseased religious feeling, aided by gross ignorance, there seems to be no end to human folly. A new 'Peculiar People' have come into notice at the antipodes, of which our readers may have heard something in the newspapers. We shall summarise information on the subject.

A few years ago a young woman of the name of Maria Heller, who lived in a small village near Hainau in Silesia, had several epileptic fits; and while she was under their influence, she pretended to receive divine inspiration and to be able to prophesy. As some of these supposed prophecies on local matters were verified, many of the villagers in the vicinity began to believe in her; and, when at last she foretold the Franco-German war, and that came true, their belief was much strengthened. Later on, some time in the year 1874, Maria announced that the Lord had revealed to her that a dreadful war would soon break out, and devastate the whole of Europe, and that Australia would be the only secure place of refuge in the world. She exhorted the villagers, therefore, to accompany her to Australia, holding out a promise that after remaining there ten years she would bring them to Jerusalem as a second resting-place, and subsequently they should return to Germany, where peace and plenty would then be found. Many of the ignorant peasantry believed, and commenced preparations for the journey. They put all their money into one common fund, and leaving themselves to Maria's guidance, proceeded by way of Hamburg to London, whence they took steamer to Melbourne. The party, numbering sixty-four souls, reached Melbourne in April 1875. Here, however, their number was reduced to sixty by the secession of four of them.

At this time, all they possessed was a little over two hundred pounds in money, and some household effects which they had brought from their German homes. They at once made their way to the Benalla district, where two of their countrymen, of the name of Berndt, had settled. From one of these (Mr Carl Berndt) they received great assistance, as most of their business had to be done through him, they themselves not being able to speak a word of English. After vainly persuading them to throw off the authority of the woman Heller, and to submit no longer to her authority, he at last declined to have anything further to do with them. They consequently became much straitened, and were nearly reduced to starvation. Their settlement is divided into two encampments, about two miles from each other, and they have built themselves bark huts to live in. They have altogether eight hundred acres of land, which they have now commenced to cultivate. Their gardens promise to be productive; but towards the end of last year, provisions were running short, and they were sore pressed. Eight of the party had died, and others were ill. One of the party who had seceded, and taken service with Mr Berndt, says that Maria has great control over them all,

that she does no work, and that under her they all run great risk of starving.

Some of these particulars having come to the ears of the police of the district, an inquiry was set on foot; and from the report made, we gather that the party were living almost entirely on 'damper' or bread, but that there were no actual signs of starvation, for the children appeared to enjoy rude health, and most of their elders seemed well, although having a worn appearance. Supplies of provisions were sent them sufficient to last until their harvest could be got in.

The party are described to be Lutherans; but they seem to have greater faith in their prophetic utterances than in anything else. They believe that during her trances, she has conversations with spirits, and that God speaks to them through her. They left their homes and native land because they believed it to be the command of the Almighty. Maria herself says that she has had these trances since childhood, and believes that God speaks to her in them.

Maria Heller is described as a little over thirty years of age—looking, however, nearly forty—not at all of a prepossessing appearance, and with a rather suspicious uneasy look. There is some doubt as to whether she is married or not, as one of the seceders from the party stated that she selected one of their number for her husband, because she had received a 'message' that she was to do so, and that they lived together; that this man had since died, and she had selected another of the party, to whom she was then engaged. Maria herself, however, indignantly denied having ever been married, or having lived with any one as if married.

Whether this small infatuated band will gain any new adherents, it is hard to say. It is more than likely, however, that the party will dwindle down into insignificance from secession or other causes, or perhaps become entirely broken up if anything should happen to their leader. But this little episode shows how, in our enlightened nineteenth century, people can be worked up to such a pitch of enthusiasm as to leave their homes on the faith of a promise supposed to be divinely revealed to them through one of their own flesh and blood. True, the people were poor ignorant peasantry; but it affords evidence that fanaticism still rules rampant in many quarters, and requires but the stimulus of a charlatan to carry it to extreme length. And yet, strange to say, there are many otherwise sensible folks who will regard Maria Heller as a spiritualistic 'medium' sent for the special furtherance of a noble cause!

SPRING'S GIFTS.

Come, when the Spring the leaf unfolds,
And calls the swallow from afar;
When earth the flower no more withholds,
And beauty wakes in bird and star.
In vain the star's soft ray,
In vain the wild bird's lay,
Unless thou come,
Thou wanderer, home;
Thou, to my heart new life to be,
Spring, with thy gracious gifts to me.

MAY.

THE first cold streaks of gray are travelling slowly from the east as Night sweeps the veil of her dusky hair from her brow, and stoops to kiss the Dawn with her pale cold lips—a kiss that brings a faintly roseate flush into the tender dappled sky—a flush that though so faint at first as to be a mere suggestion of warmth in the mind, grows and spreads and brightens till the heavens reveal themselves a vast canopy of painted air—glowing with every conceivable colour and combination of colours, gathering in intensity from the scarce defined, neutral tints in the west, up to every shade of green and blue, purple and rose, till in the east, in fiercest yet tenderest glory of crimson, gold, and orange, the god of day first raises his ruddy rim above the horizon, and the face of all heaven greets him with a joyous, dimpling smile. The Morning star, last of Night's fair jewels, fades beneath the sun-god's ardent beam, and finally drops below the horizon and disappears. The lark sings overhead as the maiden goes forth to wash in the early dew—and with a throb and murmur of delight, Morning has awoke, and May-day is born.

For it is May at last, and all the world is young and fresh and fair. Cold, stern Winter, who has held the earth imprisoned in his chill embrace so long, has at last relaxed his hold, and gathered up his skirts, from beneath which the pale snowdrops peeped, looking like flakes of snow, left to be his sweet remembrancers. The Spring was a mere child when the snowdrops bloomed, and staggered painfully on through bitter March winds and April showers, towards the warmth and sunlight of the May. But constantly retarded by late frosts and sharp blasts though she be, still, wherever her baby fingers press, a little flower springs into life; and where her weak footsteps pass, Nature hangs her mantle of tender green on every tree and hedge, and the fields grow fair with 'crimson-tipped' daisies and yellow buttercups. Our gardens have grown gay with crocuses and tulips; sweet daffodils wave their golden heads, and the pale narcissus nods at us as we pass.

The hedges are white with hawthorn, and the tall grasses wave above the purple violets and the faint sweet lady-smocks. The woods and valleys are very miracles of fresh fragrant beauty. The lovely yellow-greens of the trees seem alive with the twittering and singing of the birds, and humming of insects, who can all rejoice in the awakening of Nature. The scent of the young ferns, which are slowly uncurling their brown twisted fronds, comes to us on the breeze with the heavier, fainter odour of the wild hyacinths, which have spread their carpet of white and purple bells above the mosses and the grasses, where they stand waving their graceful heads in the breeze, looking down at their humbler sisters, the violets and primroses. The wood-anemones, in their thin robes of mauve and white and pink, dance on their fairy stems for very joy, and wave and flutter in all their ample foliage; and high above all, and sweeter in fragrance than all beside, the honeysuckle twines her myriad arms around hedge and sapling and cottage porch, and nestles her curly head on the broad breast of forest trees.

And far away up in the colder, sterner North, sweet Spring has done what she could to wake the earth from the enchanted ice-bound sleep in which Winter chained her—for on the storm-blown hills, and in the vast, silent forests, the larch has hung forth all its delicate tassels, and the dark fir boughs break into verdure; the pines clothe their dusky limbs in fringes of softer green, and the mosses are bright as emeralds, and the lichens shew purple and yellow and crimson. On many a rugged scarp the snow melts beneath the warm kiss of the sunshine, and from every mountain brow, and forest spring, and shady cove, come river and stream and fount, rejoicing noisily in their new-found liberty—all flashing and sparkling in the sunlight, and flinging their foamy spray on the mosses and lichens and the willows, as they sweep onwards to the sea.

In the sunny South, Spring has an easier task, and speedily clothes her woods and valleys in a summer-like wealth of flowers; her fields and plains dazzle the eye, and intoxicate the senses with their

luxuriance of verdure and variety of colours and scents; and through the forests, the chestnut buds have burst like magic into odorous blossom, and draped them in a mantle of exceeding beauty.

But exquisite as is a southern Spring, England's, though not so complete in fulfilment, is greater in promise. In the South, there is so little left to the imagination; the Spring is so sudden and so bountiful; Nature traces her meanings and intentions so clearly on every blossom and tree, and is so lavish in what she gives, that there is no room for hope: the mind is so overwhelmed and enervated by the generous warmth and rich profusion of treasures displayed on every hand, that it can desire nothing more. In Spain, the Spring is born a full-grown, beautiful maiden, perfect as she is; whilst in England she appears to us first a timid little child, that finds the road weary and rough to her baby feet, and has often to sit down to rest and weep by the way. We watch her tender growth from day to day, and see her gradually become stronger and sweeter and fairer as she advances through the months; and we rejoice and love her as we see some new beauty of hedge, and wood, and field, ever springing up at the tread of her childish feet. Each day her cheeks glow with warmer colour, and her lips curve into happier laughter; and in her eyes heaven's blue shines deeper and brighter, as though they had caught an anticipated warmth and radiance from mid-summer skies.

In spring-time, all Nature heaves and throbs with hope, for it is the birth-time of the year; and what tender fancies and loving hopes do not attend the advent of every soul! And who can say that the year has not a soul that lives on through the countless ages? for like the phoenix, it dies at last, old and worn out, to the dirge of wintry winds, only to rise from the ashes of its decay, fresher and fairer than ever. Spring is a time of infinite promise, of infinite possibility and patience; as each blade of corn peeps up green from the soil, and every fruit-tree decks itself in plummy blossom, we know it is another earnest of the abundant harvest of fruit and grain that we hope to reap, when Spring and Summer have gone; and so hoping, we are content to wait and enjoy the gradual sweet unfolding of the year.

If the spring-time means hope and promise to all, it means also love and joy to all animated nature; and is of especial delight to children. The swallows and other welcome comers prove the truth of the French adage—'*On revient toujours à ses premiers amours*'—by returning to our shores and twittering merrily in our caves. All the birds (saving those who have been in too great a hurry to begin, and have done it already, and the excepted cuckoo) build their nests, and the woods echo with their clear songs as they swell their little throats, and break forth in a psalm of rapture, and woo their mates with melody. Presently, the nests are filled with eggs, and then with little hungry mouths, and the cares as well as the happiness of the parent birds increase. In the fields, little long-tailed, thick-legged lambs sport and frisk beside their mothers; and the woods and lanes everywhere echo with the happy voices of children, who, with their ruthless fingers, and keen desire to possess what they admire, gather the new-born flowers by handfuls, only to fling them aside for fresher prizes, leaving them to

wither and die on the ground; and so the growing tide of death and suffering and decay, which, by a painful law, the mystery of whose nature we do not understand, and which it is so hard to reconcile with the idea of an all-powerful and beneficent Creator, must always go hand in hand with what is most fair and beautiful. The boy robs the nest of its pretty delicate eggs, and never thinks of the pain he causes to the little creatures whose blithe song he has so often heard; the cuckoo, 'darling of the Spring'—whose remorseless bantling ousts the rightful occupants from their nest, to make room for its lazy self—gives no heed to the little frail bodies broken and dying on the ground beneath, but calmly goes on its way, making the woods and valleys echo to the monotone of its minor third.

Though Spring is rich with hope and promise, it is also heavy with a vague sadness. Everything around us is so very fair, so delicately bright and beautiful, that it grieves us in an impersonal way to think of the swift decay that must surely follow on the footsteps of so much loveliness. The snowdrops peep forth from the hard ground, and gladden us with their pure beauty; we long to keep them with us in our journey down the year, but they perform their little part, and live their little life, and die; and we are inevitably led to think of ourselves—of the young lives that seem rich with promise, cut off before their time; of the many fair hopes and budding aspirations that never may reach their blossoming. When our darlings fade and die, and escape the loving hold that would fain keep them back from the shadowy land, we are apt to feel it but poor comfort to be told that it is those whom the gods love, who die young. For sad as many, and indeed most lives are, still, had they lived, their path might (if only by the strength of our loving endeavours) have been more thickly strewn with flowers than thorns—who knows? So, when we see the typical lives of Nature's children dying all around us, it saddens us, and we are fain to cry to them, as Herrick did long ago to the daffodils:

Fair blossoms, we weep to see
You haste away so soon.
We die, as your hours do, and dry away
Like to the summer's rain,
Or as the pearls of morning dew,
Ne'er to be found again!

The idea of sadness as associated with the Spring, and especially with May, is of very old as well as modern date, and of wide acceptance, for the writings of both ancients and moderns tell us that May is considered a peculiarly unpropitious month both for births and marriages; which opinion seems to differ widely from the teachings of Nature, as shewn us by her dealings with the brute creation.

But although this almost spiritual veil of vague, imaginative sadness does seem to brood over the Earth in this her glorious youth-time, it has always shewn itself hand in hand with its more joyful and tangible sister—Gladness; for, indeed, in May a very spirit of mirth seems to have possession of the children of men, prompting them to do honour to all the gracious loveliness and fair promises that Nature so lavishly pours at their feet, by all manner of festivities and holiday recreation. Long

ago, before the advent of Christ's gentle life on the earth, the expression of men's emotions was so bound up with the deep religions, or rather superstitious, feeling of the day, that it became a mere vehicle for paying honour to some favourite deity of their pantheistic mythology. Thus, the first of May was once sacred to Diana.

In our own history, from times very far back, May-day was celebrated throughout merry England with gorgeous pageant in every town and on every village green, special customs and observances of considerable importance holding sway in different parts of the country. Many of these customs were participated in by all alike, but some were peculiar to certain classes of people, such as the milkmaids' garland, and the masking procession of chimney sweeps. By a slight stretch of fancy, we can imagine what a strange gay scene it must have been in smaller, jollier Old London, when every door and window was decked out with plummy branches of sweet-scented lilac and rosy may; when every hat and head was bright with flowers; and Robin Hood, Friar Tuck, and Maid Marian, with their accompanying maskers, revellers, and morris-dancers, were playing their merry antics round the garlanded May-poles set up all over the city. How jovial, bold Robin must have looked in his coat of Lincoln green, with his trusty bow of yew, and arrows winged with peacock feathers; and near him, crowned Lady of the May—

With wreaths of violets blue,
And fresh-blown roses washed in dew,
sweet Maid Marian, where,

With eyes of blue,
Shining through dusk hair, like the stars of night,
And habited in pretty forest plight,
Her greenwood beauty sits, young as the dew.

Those old May-day pageants were very charming, as is every custom that tends to increase the poetical feeling of the common folks, and, without detracting from their simplicity, to soften the rudeness of their manners; and it is matter of regret that those sweet old rural usages are rapidly falling into disuse—a disuse which is partly attributable to the increasing, steady flow of the country towards the towns, and of its consequent adoption of their manners and amusements, together with the losing of their primitive simplicity, which has made the rustic population more expensive and artificial in their tastes and pleasures.

The onward march of civilisation, all important and beneficial though it be, seems, when looked at from close at hand, to bring a very appreciable residuum of evil in its train, and to be blotting out much that is fair and good from our sight for ever. Yet, could we but view the wonderful age in which we live from some distant stand-point, from whence should appear its whole extent, with all its multitudinous waves and counter-waves, the evil might shew itself but as the merest transient ripples borne along and swallowed up by the grand onward sweep of the mighty waves of Progress. A wall, so close to us that we can touch it, and have to look upwards to its top, hems us in, and seems an impassable barrier that shuts out from us the fair, broad prospect beyond; but from the summit of yonder hill, that dark, high wall appears in its true proportions, and we see it but as a trivial accident in the wide, sunny landscape.

But we are forgetting that it is May-day, and that, instead of moralising, we ought to be singing with the revellers on the flower-sprinkled green—

The May-pole is up;
Now give me the cup—
I'll drink to the garlands around it;
But first unto those
Whose hands did compose
The glory of flowers that crowned it.

For, after all, more general and important though these flowery feasts were in the olden time, still, even in these modern days, there is a certain amount of pleasant, simple rejoicing to be found in our country towns and hamlets; and in many places the old observances are adhered to, and the old games and songs and even dances, kept up. At Helstone, for instance, a curious time-honoured May-day measure is performed, which is taken part in by all the inhabitants, gentle and simple, and is danced to a quaint monotonous tune some centuries old. The whole town and the houses in it are thrown open, and are danced through in a long procession of couples, which ceremony does not terminate until the gloaming falls and the stars begin to glimmer in the lift, when the poorer people dance away to their homes, and the gentles close the performance with a ball.

But even when all actual festivity shall be but a tradition of the past, bright May herself will still live on in poets' mouths, and in our hearts, and in nature, as fair and rich and beautiful as ever, bestowing her kindly influence upon all. Year after year the earth will still be the stately, beautiful structure, round which sweet May will twine her riches of flowers and leaves; and all the glory of o'ercoming sounds and scents and colours; and she will still be crowned with her cloud-flecked skies. This yearly returning festival of Nature's keeping, how beautiful it is—how bright and dewy are the tender flowers, how green the trees; and when at length the day is done, and twilight falls, and the silver stars peep out one by one from the empyrean, and with deepening glow of gold, spangle the falling veil of Night; when the crescent moon mounts the steep of heaven and shines aloft, bathing the earth and the sleeping flowers in a dim, tender radiance, and a hush falls on all Nature then suddenly will the woods be thrilled as Philomel tunes her throat to song, until anon even she is hushed, and all is peace and rest.

FALLEN FORTUNES.

CHAPTER XXII.—MRS CAMPDEN'S VIEW OF THE MATTER.

NEVER since that crushing blow had fallen upon his fortunes, did John Dalton feel so light of heart as after those few words from his old college friend. From him at least he had met with genuine and hearty sympathy; his assistance had been not only readily offered, but had been such as he could accept; and behind all that frank manifestation of generosity he felt there lay a fund of kindly feeling towards his dear ones, upon which he could rely with confidence when he should be sundered from them. True, he had had no cause to believe that things would have been otherwise; George Campden had always shewn himself a generous, manly fellow, but the occasions when he had done so, had offered themselves so long ago, that Dalton, sore

with the rûls of Fate, and prone to suspicions, had almost doubted him: twenty years of married life might well, he had thought, under the circumstances, have altered the man, and made him cold and prudent. But now he felt that he had done his old friend wrong.

Edith, as he had concluded, was in her own room, for when they talked together now, it was never, as of old, in apartments where they were liable to interruption; and he ran up-stairs, as he had been wont to do before misfortune clogged his heels, three steps at a time. He had some good news to tell her at last—namely, of the generous kindness of 'Uncle George,' who had been always a great favourite with her; and he was eager to see her smile again. To his astonishment, he found the two girls with their mother.

'O papa,' cried they, throwing their arms about his neck, 'we are so sorry.'

'What, you have told them, Edith!' exclaimed he reproachfully.

'It was better they should learn it from my lips than from any other's, dearest,' answered she, 'and that they would have done to-night. I am almost sure that Julia heard of it by this afternoon's post.'

'That is strange, for so did Campden.—Well, my darlings, so your mother has told you all. Can you ever forgive your father?'

'Forgive you?' answered Kate.—'What does he mean, mamma?'

'Then you have not told them the worst, Edith.'

'Yes, indeed, she has,' put in Jenny quickly, 'and that is what we are crying about. To think that you should be going to Brazil!'

'But, my poor Jenny, do you know why I'm going?' inquired Dalton in desperation.

'Of course we do: to get back the money that has been so unfortunately lost. You don't suppose Kate and I were crying upon account of the money!'

'Alas, my sweet children, I have ruined you!'

'Not at all, papa; we are going to be poor, like many other people much better than ourselves—or at least than myself'—continued Jenny, modestly correcting herself. 'This state of poverty will not last long, because either you will be coming back to us from Brazil with a gold mine in your pocket, or Kitty will marry the Marquis of Carrabas; and even if those events don't happen, I can make lace, which Mrs Campden says her good friend Lady Mary prices at six guineas a yard; I can make a yard in three days, which is twelve guineas a week, even without being driven to work on Sundays.'

Dalton understood it all, as he thought; it was a conspiracy of the girls with their mother to put the best face they could upon affairs, in order that he might keep up his heart; but as a matter of fact, there had been no such arrangement. The first thought of both the girls had been for their parents, and their bitterest reflection was, that their father must needs leave them all so long, and at such short notice. 'What will mamma do without him when baby comes?' was the question that each put to herself, and did not dare to answer.

'To think that the first tears I have ever caused my darlings to shed,' said Dalton, still embracing them, 'should be such bitter ones!'

'I am not going to cry any more at all,' said Jenny, wiping her eyes, and speaking very boldly.

'Only, you must submit to be made as much of as possible by all of us until you go, papa.'

That was to be his punishment, it seemed—so far as they were concerned—for having ruined them all.

'Does Tony know?' inquired Dalton gently.

'Well, not the worst—not about your going to Brazil,' said Kitty. 'We informed him that we had lost all our money; and he said he was very sorry; but the fact was, he was so impatient to have a ride upon the doctor's pony, that he could not afford to give much attention to the other matter.'

'But when you just sent him, Edith, to say you wished to speak to me, do you mean to say—'

'That he knew we were all ruined? Oh, certainly,' put in Jenny, laughing. 'Perhaps, if we had told him that he would not now be sent to Eton, that would have dashed him a little; but the boy looked so pleased and eager about his ride, that we had not the heart to tell him that.'

'That is fortunate,' said Dalton, smiling, 'for as it happens, it will not now be necessary to do so. His godfather has volunteered to put him to Eton.' Then he related to them how splendidly 'Uncle George' had behaved in the family crisis; tidings which were received with rapture, but without surprise.

'Whenever Uncle George is left to himself,' said Jenny confidently, 'he always does the right thing.' This invalid young lady had a way of dispensing praise and blame which suggested finality, if not infallibility; and in the present case there was universal adhesion.

'The doctor is here, you say,' said Dalton; 'have you seen him to-day, Jenny?'

'O yes, papa—that is why mamma sent for you.'

'Good gracious! what is the matter?' inquired Dalton anxiously.

'Nay, my dear, there is nothing wrong with Jenny,' put in her mother assuringly; 'the doctor had something to say upon quite another matter. Do you know, I am pretty sure that he knows, or at least suspects'—

'Very likely,' said Dalton, as indifferently as he could, but not without a blush, as he thought of how, but for that same doctor, these dear ones would have had what would have seemed to them a worse thing to battle against than ruin. If his going to Brazil affected them so much, how would it have been with them had he died! Wife and children, he now understood, took a different view of life from that which his own stand-point had presented to him; and as he had nothing but the interests of those belonging to him at heart, he was thankful for their sakes that his intention of quitting existence had been frustrated. He had not yet owned to himself that he was ashamed of having entertained it, yet he blushed to remember that the doctor knew of that attempt to cut his cable. Edith naturally misconstrued his rising colour.

'You mustn't mind the doctor, John: if we could confine the knowledge of our calamities to such men as Uncle George and him, it would be a comfort indeed. What he came to tell us was, that old Mr Landell was dead; "And if you happen to know of any one," he said, "who wants to rent a charming little residence as cheap as dirt, quite out of the world, and in a little paradise of its own—with the best of living doctors within ten minutes' walk of it—there is the Nook in

Sanbeck vacant." I am almost certain, by his manner, that he intended the proposition for our personal consideration."

"Perhaps he did, my dear," said Dalton thoughtfully: "it is, no doubt, a matter to be considered. Your letter has not yet gone to Nurse Haywood, and we must think about it. It is a question of town or country."

"We could live in Sanbeck," said Edith, "as cheaply as in Brown Street, I should suppose."

"And you would be near your friends, my darling—Campden and his wife; you would not be without society."

"I shall not care much about society, dear John, till you come home again," answered Edith gravely; "I shall be quite content with the companionship of the girls and Tony, and shall have no wish for more."

Dalton and his wife were not quite at one in this matter: he was speculating as to whether this friend and that would drop away from them in their altered circumstances; while with her, friends had become of small account; she clung more than ever to her own belongings; and hence it was that her husband's sudden determination to go abroad had so utterly prostrated her. She fought on bravely, as we have seen, but it was almost like the brave Witherington in the ballad.

"But think how charmingly out of the world we shall find ourselves at Sanbeck!" put in Jenny quickly; "it is not likely that any one will come and look after us there, unless they are really fond of us. And what beautiful scenes there will be for Kitty to sketch!"

"And think how full the house will be of books, mamma, since, I suppose, we shall take it furnished," urged Kitty; "so that Jenny will be in the seventh heaven!"

They knew that their mother preferred the country to the town, but also that she would never allow herself to be influenced by her own predilections; she would be moved, however, easily enough by the wishes of her girls, and therefore they thus pleaded, each as her nature dictated, for the other.

"Of course it must depend upon the rent and so on," said Mrs Dalton, yielding with the difficulty she always experienced, when what was sought was in accordance with her own sweet wishes. This plan of burying herself and the girls in this secluded valley until her husband should return and disinter them, recommended itself to her very strongly. She had never liked London, notwithstanding that she had met with such welcome there, and but for her husband's sake, would have always sought retirement. "There will be certainly one great advantage: we shall always have kind Dr Curzon near us, for dear Jenny."

Jenny was generally somewhat impatient of being supposed to need medical superintendence, but in this case she made no protest; it was, in fact, an inexpressible comfort to her to think that Dr Curzon was to be near them, not upon her own account, but on her mother's, about whom she had sad misgivings; apprehensions, indeed, so terrible, that she scarcely dared to contemplate them, even in her prayers.

Then the doctor was admitted to the family conclave, and made his statement. Old Joe Landell had died that very morning; and his widowed sister from London, Mrs Grant—who had been

staying in the house during his late illness, and who was his sole relative and heiress—had been very communicative to him at various times. She had informed him, amongst other things, that she should let the house as it stood, if she could find a tenant who would not be too exacting in the matter of repairs. As for the old books, she was told they would not pay carriage to London, and might 'bide' where they were. She had a sort of hereditary pride in the place, which prevented her from parting with it altogether; yet she had but small expectation of letting it, except to 'some artist or such-like,' in the summer months; so that it was certain she would welcome a yearly tenant almost at any price.

"I thought you might be acquainted with some family, my dear Mrs Dalton," concluded the doctor indifferently, "with whom economy might be an object—for certainly there is no cheaper place than Sanbeck in all England: you can't spend money there even if you would—who like retirement, and have a taste for the picturesque; who are studious, and capable of amusing themselves when left to their own resources: moreover, if any member of it happens to require medical attendance, the very best advice is almost within call."

"You seem to have got it all up very pat," observed Dalton, rather audaciously, considering what had caused his friend to take so great an interest in the matter.

"Why, the fact is, I promised to write an advertisement out for the disconsolate heiress. She is one who takes time by the forelock, and is not so much inclined to give way to morbid sentiment as some of us," answered the other significantly.

"Come, doctor, confess," said Mrs Dalton, laying her hand upon his arm; "you had us in your eye for this strong-minded widow's tenants all along."

"My good lady, I don't know what you mean by 'all along':" if you would suggest that I killed off poor Jonathan Landell in order to accommodate my friends with a residence in this county, I reject and repudiate the imputation. He died in a natural way, poor fellow, by the visitation of Dr Jefferson."

The effect of a vigorous and wholesome mind—which is at the same time sympathetic—when it is brought into connection with minds depressed, is like that of a disinfectant among impurities; it begets a purer and lighter atmosphere; and thus, after half-an-hour's talk with the good doctor, who was full of practical ideas of all sorts, the entire Dalton family found themselves in better case: he had lifted the whole house—as the 'removers' do in the United States—on to another stand-point, from which the future looked more tolerable. Perhaps one of the strongest reasons that actuated each of them, more or less, to take the doctor's advice as respected the Nook, was the consideration that they would thereby secure for themselves—independently of his professional skill—so friendly a neighbour. The profession of medicine is not socially thought very highly of, notwithstanding that 'the first true gentleman that ever breathed' was also the Great Physician; and yet I know of none the members of which have so good a right—if delicacy and generosity can confer it—to hold the highest place. At the great Day of Account, when the

Tables of Precedence are otherwise arranged than by the Herald's College, it is my belief that there will be a *bouleversement* as respects the Faculty.

At the front-door stood the doctor's pony—a good deal warmer than usual from his unaccustomed exertions under Tony's guidance—and that young gentleman himself, in a great state of excitement, frou having taken a successful fly over a hurdle, held up for him for that purpose by Jeff and a groom.

'Well, Tony, did you enjoy your gallop?' inquired his father.

'O yes, papa.'

'I am afraid you will never have a pony of your own, my boy, as we once intended,' said Dalton, patting his glowing cheek.

'I know that, papa, and I don't mind a bit; I was just telling Jeff so.'

'Oh, Mr Dalton, I am so sorry,' said Jeff; and the young man held out his hand.

If there had been fifty thousand pounds in it, the action could not have been more gracious, or the tone more tender.

'You are a good fellow,' said Dalton warmly; and nothing more was said between them about the change in his circumstances.

But by this time there was tattle enough about it at Riverside. Some may pronounce the sagacity of vultures, for detecting what is amiss, to be unparalleled; but the manner in which a man's misfortunes get abroad, and are pounced upon by other members of the human family, is remarkable also. Whether by eye, or ear, or sense of smell, the thing is conveyed, I know not; but not a soul in Mr Campden's household was ignorant of what had occurred to 'those poor Daltons' within half an hour of his own discovery of the fact.

Of course Mrs Campden was among the first to know it; her husband told her, in fact, when he came in from his talk with Dalton, making a most unaccustomed visit to her boudoir for that purpose.

'Alas! Julia, is it not terrible? Our poor friends are as good as ruined.' And then he stated the whole circumstances.

'It is very deplorable indeed,' returned his wife, but without shewing any excess of sorrow in voice or gesture; and yet not so sad as it is wicked. I should think that men would never forgive himself. The idea of his squandering his wife's money, as well as his own. I call him a scoundrel!'

'You had better not do so before witnesses,' observed her husband dryly, 'because it is libellous.'

'But don't you call it most wicked and most unprincipled, George, yourself?' inquired Mrs Campden, with a little less acidity. There was something of unaccustomed independence, and even worse, in her husband's tone, that alarmed her; his motto was ordinarily 'Defence, not defiance;' but on the present occasion he seemed to have adopted a bolder cognisance. She was almost certain he was in one of those rare fits of 'obstinacy,' to which he had not given way for years, and which she had flattered herself her skillful treatment had eradicated.

'Have you any excuse to make for such a man, Mr Campden?'

'I am not thinking of excuses; I am thinking of how to help him,' was the quiet rejoinder.

'I hope you are not going to lend him anything,

because that would be sending good money after bad.'

'No; I am not.'

'And as for giving him any sum right out, that would be an absolute encouragement of gambling and dishonourable conduct. Indeed, I should hope Mr Dalton would be too much of a gentleman to take it.'

The arguments were mixed, and even a little inconsistent, but it was impossible to doubt the conviction of the advocate.

'I don't know, Mr Campden, whether you are paying me the compliment of listening to my expostulations.'

'Yes, yes; I hear you. You need not be afraid of my giving John Dalton money, because he would not like it. I did offer to lend him some—I should have been ashamed of myself not to have done as much for so old a friend—but he refused it.'

'Well, well, I am glad he has shewn some good feeling,' said Mrs Campden, in a tone of unmistakable relief. 'I am sure, whatever we can do—in reason for his wife and children, I shall be glad to further.'

'For any sake, be kind to them in your manner, Julia!' said her husband pleadingly.

'In my manner? Well, really, Mr Campden, I think you might have dispensed with that piece of advice. I hope I know how to behave myself towards my guests, and especially when they have been stricken by misfortune.'

'Doubtless, my dear—doubtless.' The momentary courage with which commiseration for his old friend had inspired him, was gradually ebbing away from him; the impress of that worn, pained face, as he had just seen it (and that he had remembered in its youth so bright and sparkling), was fading from his retina, and in its place were this woman's hard, pale eyes and imperative glance; he felt, with a sort of shame, that he was returning, under their influence, into slavery. 'You mean, I am sure, nothing but kindness, Julia.'

'Mean! Mr Campden; I have never expressed anything else, I hope. I may have had my own opinion concerning Mr Dalton, all along; but I have treated him with a courtesy that was, I am sorry to say, not at all times reciprocated. You have always entertained what I believed to be an exaggerated opinion of his talents'—

'My dear, all the world was of the same opinion,' put in Mr Campden.

'Well, let us hear what the world says now. Foolish people, of course, are easily dazzled by a superficial sparkle that passes for wit; but I have heard persons of judgment and high position—such as Lord Wapshot say they could never understand what there was to admire in the man.'

'I believe that,' said her husband gently; 'poor John had his detractors, no doubt.' She looked at him suspiciously, but the twinkle that usually accompanied his little strokes of satire was not in his eye.

'Of course he had, Mr Campden, and deserved to have them. Indeed, when this disgrace comes to be known'—

'I did not say there was any disgrace in the matter, Julia.'

'No, George; but I did; and most people, I fancy, will be of my way of thinking. At all

events, the man has speculated not only with his own money, but other people's.

'I never heard that. It is true he risked his wife's money; but I thought—perhaps it is only a fiction of the law—that man and wife were one.'

'If you choose to split hairs like that, Mr Campden, it is idle to argue with you. The plain fact is, that Mr Dalton's rashness—or gambling or disgraceful conduct of some kind, call it by what name you like—has brought himself and his family to utter ruin; and the question is, how we ourselves ought to proceed in the matter.'

'You mean, I suppose, as to how we can best help them?'

'I mean nothing of the kind. Of course we shall help them. You are always thinking of pounds, shillings, and pence, Mr Campden, and rarely look beyond them. But to me at least, the matter presents itself on much higher grounds—that of principle.'

'Then they'll never get anything,' observed Mr Campden naively. 'I beg your pardon, my dear,' added he hastily, though the thunder gathered on the little woman's brow, and the lightning darted from her eyes; 'I mean nothing offensive, I assure you; but I have observed that when anything is done "on principle," it is always a hard thing: the word is never used except to palliate something harsh or unjust, or to excuse a man from putting his hand into his pocket. And—and—I wish you wouldn't be so fond of using it, Julia.'

'Well, upon my honour! Mr Campden, are you in your seven senses?'

'Unfortunately, I am,' murmured the unhappy man; 'I wish I had but six of them. When a man falls in love, he is blind, they say, though his eyes are opened very soon afterwards. When he is married, he should be deaf.'

'I have never been so insulted in my life, sir!' continued Mrs Campden in a voice shrill with passion, 'and all because of a worthless fellow. I have the misfortune to be distantly related to Mr Dalton, but that is no reason why I am to put up with his impertinence; and no reason why we are to impoverish ourselves in order to replenish his purse, and supply his defalcations. I shall let him know his true position, you may depend upon it; he shall not give himself any more airs of superiority here.'

'Take care what you do, woman—yes, woman! Hang it, madam, you shall find I am master in my own house for once. If you insult my old friend—in his ruin—under my roof; if you take advantage of his fall to wreak your spite, and pay out old grudges; if you dare to do it, madam!—Here he stopped, overcome with a passion to which hers had been but as water is to wine.

'You had better not say anything more, George,' observed Mrs Campden. Her tone was far from menacing; she wore an 'injured' air; for the first time in her life she was frightened at her husband.

'I hope it will not be necessary,' returned he with a certain dignity. 'I have done. Our guests are probably leaving us in a day or two. Dalton is going to Brazil, perhaps never to come home again. Be kind to him, if not for his own sake, yet for mine; I ask it as a personal favour. As for his wife and children, the innocent victims of his rashness, I need not bespeak for them your

tenderest sympathy.—I am sorry if I have used any expressions which have given you pain, Julia; and Uncle George held out his hand.

'I am sorry too,' returned Mrs Campden stiffly, and taking no notice of the olive branch thus extended to her. 'The conversation was none of my seeking.—That is Mary's step coming along the passage.'

It was seldom indeed that his daughter's presence was not welcome to Mr Campden; but on this occasion he passed out of the boudoir by a side-door, and thereby avoided her. The good-natured, honest fellow was full of chagrin and discontent; angry with his wife, but still more with himself. He felt that he had mismanaged matters; perhaps his little woman—as he was wont to term her when matters were going well between them—had not been so much to blame as his own clumsiness; he had obviously alarmed her too, and it was a cowardly thing for a man to frighten a woman. His intention had been to bespeak all her good offices in favour of this unhappy family, and he felt that instead of that, he had aroused a slumbering enmity against its head. She would be good, of course, to his wife and children; but he knew that he should feel a sense of relief when his old friend, John Dalton, had left his roof.

WHO OWNS THE NORTH POLE?

No human eye has ever seen the North Pole, so far as historical testimony goes; and fancy may hence indulge itself freely as to what that said mystery really is. We most of us know that it is simply a spot as far as possible northward on the earth's surface from the equator; that the South Pole is a corresponding spot in the other hemisphere; and that each has (in geographical language) 90 degrees of latitude, or, in other words, is situated respectively about six thousand miles north and south of the equator. Whether dry land, salt sea, or eternal ice occupies either or both of the spots, no one yet knows. Possibly Captain Nares may tell us, when the *Alert* and *Discovery* return from their arctic explorations.

The attempts to reach the North Pole, or at least to make some near approach to it, have been going on through a long series of years; more or less combined with other attempts to find a westward route to China and India round the northernmost coast of America. The readers of this *Journal* are tolerably familiar with the second of these two kinds of enterprise, generally known as North-west Expeditions—from the days of Ross and Parry to those of McClintock and Allen Young. There have also been several north-east expeditions, towards the northern coast of Russia and Siberia; and others more professedly due north, in search of the mysterious Pole itself.

The approximations to the North Pole, as denoted by higher and higher latitudes, have certainly not been very rapid. Brave old Baffin reached the very top of the bay named after him, in latitude 78 degrees, so far back as 1616. Spitzbergen, as high as latitude 77 degrees, was known

to Barentz in 1596; while Hudson and later navigators traced it up to 80 degrees. After the recommencement of such expeditions about sixty years ago, advancements farther towards the north were few and far between; whereas those to the north-west, by the many inlets and straits on the western side of Baffin's Bay, were numerous. Buchan and Franklin tried the northern route in 1818, between Spitzbergen and Greenland, but were speedily brought to a stop by large fields of ice. Franklin, Richardson, Ross, Parry, Hoppner, and Lyon, between 1818 and 1825, made extensive westward explorations and discoveries, without increasing our knowledge of very high latitudes, while Wrangel about the same time was exploring round north-east to Nova Zembla and the arctic coast of Siberia. In 1827 Parry made his remarkable attempt to reach the North Pole by boat-sledging due north from Spitzbergen; he reached the unprecedented latitude of $82\frac{1}{2}$ degrees, but there, while still some five hundred miles short of the goal, he found that the ice-field under him was floating south as fast as he was sledging north, inasmuch that he would have got no nearer the Pole by continuing his exertions. John and James Ross between 1829 and 1833 discovered much and suffered much, but did not attain a high latitude. The same may be said of Back between 1832 and 1837, of Dease and Simpson about the same period, and of Rae in 1844. At length came the momentous Franklin Expedition of 1845. Neither the *Erebus* nor the *Terror* was ever again seen by European eyes after the autumn of that year; nor the brave commanders, Franklin and Crozier; nor any one of the hapless crews of one hundred and twenty-eight men. What they did, how they suffered, where and when they died, we have not here to tell; suffice it to say that they did not reach a greater latitude than 77 degrees north—nine hundred dreary miles short of the Pole.

Then came the wonderful series of expeditions in search of poor Franklin and his heroic fellow-sufferers. We know, from the ample narratives which have appeared in print during the last thirty years, that in 1848 Kellett and Moore went to Behring's Strait, to pick up any possible news of the missing ships; that in the same year Richardson and Rae, travelling through the Hudson's Bay territories, examined much of the north coast of the American mainland; that in 1849 James Ross visited most of the straits, gulfs, and sounds which it was supposed Franklin had probably traversed; that about the same period Saunders, Goodsir, Pullen, Forsyth, De Haenen, Kane, and Griffin joined in the search; and that in 1850 and 1851 Austin, Ommaney, M'Clintock, and Sherard Osborn made extensive discoveries towards the west of Baffin's Bay. But of one and all of these this may be said—that they presented no example of a nearer approach towards the mysterious North Pole. Again and again were new expeditions sent out—Penny and Stewart in one direction, John Ross in a second, Collinson and M'Clure in a third.

Mostly the English government defrayed the cost; but some of the ships were fitted out by private subscription, especially by the noble-hearted Lady Franklin, who clung to a belief that her husband was still living, how much soever surrounded with perils. Kennedy, Bellet, Inglefield, Maguire, Belcher, Anderson, Allen Young, Hobson—all are to be added to the names of the brave men who, with their daring crews, joined in the good work, at various dates between 1852 and 1859. Still, however, the same thing has to be said as before; no nearer point to the North Pole was reached.

'Our American cousins' must be credited with the favour now bestowed by the best arctic authorities on what is known as the Smith Sound route. Leaving the English to search for Franklin, the Americans sought to push on towards the Pole. In 1853-4-5, Kane advanced farther north up that Sound than any predecessor; and a sledge-party from the ship, under Morton, reached what appeared to him like distant indications of an open Polar Sea. Hayes, in 1860 and 1861, went considerably beyond Kane and Morton, planted the American flag on the northernmost land up to that date visited, and saw a white headland at about $82\frac{1}{2}$ degrees latitude. And lastly, Hall followed the same route in 1871-2-3, attaining to about the same latitude as Hayes. From the drift of the ice and the set of the currents, more importance is now attached to that route than to any other, as a possible means of reaching the Pole. Captain Nares (if alive) is on that route at the moment we write; whether in Smith Sound, Kennedy Channel, Hall Basin, Lincoln Sea, or even beyond that limit, we know not. His two stout fortified steamers, the *Alert* and the *Discovery*, are to aid each other; but the government have wisely left to his own discretion the determination of the spot or spots where to 'winter,' and the arrangements for spring-sledging. If he finds open sea before him next July or August, onward he will go with one of the ships, with the possibility of reaching—who can say what?

The continental folk are also contributing towards the search for the much-talked-of North Pole—keeping east or west of Spitzbergen instead of trying the Baffin's Bay and Smith Sound route. Forell, a Swede, in 1861 reached north-west of Spitzbergen to a latitude of $80\frac{1}{2}$ degrees. Norden-skiöld, in the Norwegian vessel *Sofia*, excelled this in 1868, attaining $81\frac{1}{2}$ degrees. He claimed this to be the most northerly point ever reached to that date by a ship, as distinguished from a boat or a sledge. Expeditions from Bremen and Norway went out in 1869 and 1870, but without reaching a high latitude. Lastly, the Austrian expedition under Weyprecht and Payer, in the *Tegethoff*, had much success in 1872-3-4, reaching a little over $81\frac{1}{2}$ degrees, and discovering a large island north-east of Nova Zembla, to which they gave the name of Franz Josef Land.

Well, supposing any of these hardy commanders and men really to reach the North Pole, what then? What will they do with it? How will they treat it; and if they do not keep it, to whom will they give it? The same questions might be asked concerning the South or Antarctic Pole, which occupies but little of public attention, because only a few expeditions have gone out in search of it. No higher latitude has ever been

reached in that region than 78 degrees south (about eight hundred and thirty miles short of the mark), which was attained by James Ross thirty-four years ago, when in command of the *Erebus* and *Terror*.

When, or if, either pole is reached, ownership will depend on dry land. Should the spot at 90 degrees latitude be covered with sea or with ice, it will belong to all the world. In the case of water, a buoy; in the case of land, a staff, might display for a time the nationality of the discoverer, as denoted by a hoisted and unfurled flag; in the case of ice, no one would care to dispute with the seals or walruses for ownership. Should the spot, however, be dry land, an island or part of a mainland, the discoverers would certainly like to land upon it, and have the honour of taking possession in the name of the nationality represented. Beyond all possibility of doubt, if an American ship be the first to reach that long-sought goal, the stars and stripes will speedily wave in the wind. Equally certain is it that if the *Alert* or the *Discovery*, or a boat-party or a sledge-party from either ship be the first, the British flag will be hoisted.

The learned men who have treated of the law of nations, the general law which bears on the relations between one country and another, as distinguished from those existing among the inhabitants of any one nation, have not failed to see the importance of settling this matter of the rights of discoverers. Shall it be 'first come first served,' 'finding's keeping?' Vattel, a great authority on all those subjects, tells us that 'all mankind have an equal right to things that have not yet fallen into the possession of any one; and these things belong to the persons who first take possession of them.' So far plain; and then for the practical application. 'When, therefore, a nation finds a country uninhabited and without an owner, it may lawfully take possession thereof; and after it has sufficiently made known its will in this respect, it cannot be deprived of it by another nation.' Therefore, if England finds land at the North Pole, she may keep it, provided she thinks it worth while to maintain the claim. Ownership, however, is one thing, sovereign rule or government is another. But it appears that the discoverer possesses both: 'when a nation takes possession of a country to which no previous owner can lay claim, it acquires both the domain and the empire or sovereignty.' Therefore, if and when we lay hands on the North Pole, we may impose any laws on it we please—albeit, there may be no native or aboriginal inhabitants whatever living there. We have certainly done this with regard to the Auckland Islands.

But what if there be, in the newly discovered land, aboriginal dwellers whom the discoverer chooses to call barbarians or semi-barbarians? Here we have a condition of things which has given rise to much contention and bloodshed. Captain Cook might have 'annexed' many of the islands which he discovered in the South Sea; but he was not authorised by his sovereign to do so; moreover, it is not clear that the sovereign would have had a right of appropriation, seeing that the islands already contained inhabitants. The violent deaths of Captain Cook himself, of John Williams the missionary, of Bishop Patterson, and of Commodore Goodenough, are in themselves sufficient to testify that aboriginal natives

are not very ready to admit the superior rights of strangers who come to them from Europe—despite the kind motives that brought the visitors thither. We had almost endless troubles with the New Zealanders on this ground, not terminated without the expenditure of much blood and treasure. New Holland or Australia gave but little trouble, the blacks being so few and so unready to shew themselves. Pitcairn Island was uninhabited until the mutineers of the *Bounty* landed there; they took the property to themselves, and their descendants were quite delighted when Queen Victoria consented to be their sovereign. Many of our settlements in Africa, America, and the adjacent oceans were claimed as the result of discovery, notwithstanding the knotty fact that the black man or the red man was already a denizen there. International statesmen have had some difficulty in laying down a strict rule for guidance in this matter; but Vattel puts the case thus: 'A nation may lawfully possess some part of a large country in which there are none but earlier nations whose scanty population is incapable of occupying the whole. Those nations cannot exclusively appropriate to themselves more land than they have occasion for, or more than they are able to settle and cultivate; their unsettled habitation in such regions cannot be accounted a true and legal possession.' Nice points these, if the country happens to be fertile, rich in minerals, or well placed for commerce. Discoverers have, hitherto, not been very particular in ascertaining how far the aborigines are able to occupy and cultivate the soil; they are prone to take what they are strong enough to hold, and stretch the right of discovery about as far as it will bear. We shall not have much trouble, in this respect, with the possibly-to-be-discovered North Pole. If Captain Nares succeeds in getting there, if he finds it to be land, and if he meets on that land say Ooloulouk the Eskimo with his wife and family, those interesting people will not prevent him from planting the British flag on the island, whether he leaves it behind him or not.

Be it known to all buccaneers, pirates, filibusters, and adventurers, that the law of nations does not allow *them* to hold the ownership and sovereignty of any new lands they may discover. They must work for some state or power recognised by other nations, else they may at any time be dislodged. 'Navigators going on a voyage of discovery, furnished with a commission from their sovereign, and meeting with islands or lands in a desert state, may take possession of them in the name of their nation; and this title has been usually respected, provided it was soon after followed by a real possession.' The constitutional lawyers of the United States at one time pressed this claim too far. In reference to the Oregon territory, an American ship, whether commissioned or uncommissioned, was declared to have equal power. 'The first discovery, even by an uncommissioned merchant-ship, gave priority to the claim of the United States in that region.' It gave rise to a knotty controversy between English and American diplomatists.

All things considered, the North Pole will not be a very eligible property to the first comer; and we are not likely to quarrel with foreign nations for the possession of it. The British flag may perchance wave there in triumph some day, and we hope it will; but the great interest attached to

the expedition now out in these regions, and to others of similar kind, is based upon far higher considerations than the ownership of a (possible) patch of sterile land.

AN EVENTFUL VOYAGE.

IN TWO CHAPTERS—CHAPTER II.

AFTER hearing his sentence, Vaughan went to our berth, and threw off his cap; and pulling off his uniform jacket, took out his knife, and after carefully cutting off all the gilt buttons from his jacket, and likewise removing the badge off his cap, went to the vessel's side and threw them overboard. He then put on a blue serge shirt and pair of dark blue trousers, and said with a laugh: 'Bye, bye, boys; I am going before the stick, and have got Irish promotion. But I've not done yet; so some of you look out.' He seemed perfectly reckless; and asking young Lullin, the junior mid, to lend him a hand with his chest, threw it over his shoulder, and marched boldly into the fore-castle with it, and within ten minutes had slung a hammock there. From that day, Vaughan altered much for the worse. The affair with the second mate, and consequent disgrace, occasioned much excitement and discussion among the passengers; the ladies especially, who sympathised with their interesting friend. There was, however, one on board who felt Vaughan's disgrace far more keenly than he did himself, and that was Blanche Talbot. The day that he was sent forward she did not appear on deck, and remained in her cabin, saying that she was unwell; and Mrs Boyle, although a strict disciplinarian, privately interceded for Vaughan with Captain Benbow, but without success, as the colonel and the judge approved strongly of the action taken by the captain. The subaltern officers, however, said that it was a shame, and that Sparks had deserved all that he had got.

Under the plea of indisposition, Miss Talbot declined to play in *The Loan of a Lover*; and as the scenes were unfinished, and no one but Vaughan could paint them, the entertainment did not come off; and so a concert was substituted, which, owing to the indifference of the ladies, turned out the reverse of successful.

We were in the latitude of the Cape, and bowling along before a moderate breeze, with studding-sails set on both sides. It was about three in the afternoon. The captain was in great good-humour, and said that he never remembered making a voyage with so little bad weather, and was looking forward to arriving at the Cape in a couple of days. This voyage, he said, was to be his last, prior to his retirement from the sea. While seated at the table, one of the stewards came hastily to the chief officer, and whispered to him that he was wanted on deck. Mr Blake rose from the table, went up the companion-ladder, and in a few moments returned and whispered something in the captain's ear. What that something was, no one heard, but the old captain turned very red, and said: 'Excuse me, ladies, but I am wanted on deck.' He neither finished the story he was telling, nor his curry.

'Are we near land?' asked Miss Talbot; but the captain apparently did not hear her, for he seized his cap and rushed out of the cabin on to the main-deck.

'I hope,' said the colonel's wife, 'that nothing has gone wrong; it is so unusual for the captain to be called away.'

The dinner begun so pleasantly, ended abruptly. The captain did not return, conversation stopped, and every one hastened to get on deck.

'The ship is on fire!' was the startling announcement whispered by the chief officer to the captain, adding, that the fire had only just been discovered in the forepeak among the boatswain's stores.

The shrill pipes of the boatswain and his mates were then heard calling all hands on deck. And those on deck were busy dragging the hose along, fitting the pumps and manning them, and plugging the scupper-holes. The startling news had already reached the passengers, and produced the greatest excitement among them. How the fire originated no one seemed to know. The facts, however, were simply that the boatswain, under the instructions of Mr Sparks, had ordered Vaughan to go down the peak, get some tar, and tar down the top-gallant and fore-topmast rigging. This was intended as a punishment for further disrespect to the second officer that morning. Vaughan took a lantern from the gunner's house, and being in one of his vile tempers, disappeared, muttering curses on the second mate as he did so. The tar was kept in the boatswain's locker, and had to be drawn from a cask. It was the duty of the boatswain or his mate to have done this, but the boatswain was engaged setting up the main rigging; so Vaughan finding the locker open, helped himself. In about ten minutes he returned, bringing the tar-pot and the lantern with him, and then went aloft to commence his task.

About twenty minutes after this incident the look-out man on the fore-castle gave an alarm of fire, and as he did so, smoke was seen ascending from the fore-part of the vessel, and on lifting up the cover of the booby-hatch the hold was discovered to be in flames. Captain Benbow, for the first time during the voyage, now appeared on the fore-castle, followed directly afterwards by Colonel Boyle, for the news had spread through the vessel faster than the fire itself. Captain Benbow looked very anxious, but he gave his orders promptly and with firmness: 'Mr Blake, take in all studding-sails. Haul up the courses, and stow them. Keep her before the wind.—Now, colonel, let your men man the pumps, and keep them going.—Mr Sparks, direct the hose.' While these orders were being executed, what with the sailors shouting, while hauling on the clewlines and buntlings and reducing sail, and the confusion and consternation among passengers and troops, the greatest excitement prevailed. The poop was crowded with ladies and officers, and the main-deck with troops, all equally terror-stricken. When the fire was discovered, the vessel was going eight knots, but when the studding-sails were taken in, and canvas reduced, she fell off to five knots. The clank of the pumps could be heard above all the din and noise of the people. Colonel Boyle ordered the bugler to sound 'Parade,' and the troops who were not pumping, formed line. He then made a short stirring speech to his men, and told them that the only chance of saving their lives was in maintaining discipline, and obeying and carrying out the orders of the captain; and he told them that under any circumstances he trusted they would behave as British troops had behaved before on a

similar occasion, and made touching allusion to the loss of the *Birkenhead*.

The cargo of the *Dangalore* consisted of pitch and turpentine, wine, spirits, piece-goods, books, and a quantity of ammunition belonging to the troops. The captain ordered the first two named articles to be thrown overboard, but being at the bottom of the hold, they were difficult to be got at. All the pumps were double manned and in full play, and both soldiers and sailors were working as men only work when they are trying to save their lives. The main-hatches were taken off, and the third officer with a large gang of men commenced breaking out the cargo, to get to the powder, for the purpose of throwing it overboard. This was a work of difficulty, although four sets of hose were playing down the fore-hatch. The smoke was so dense and stifling that it was evident that the pitch and turpentine were on fire. I saw Vaughan for a minute on the fore-castle; he was as black as a sweep, and his clothes were singed and burnt. When the chief officer dropped senseless on deck, overpowered and choked with the smoke and fumes, it was Vaughan who took the hose and actually jumped down the hold and directed it. He was hauled up again, by order of the captain, but not before he had narrowly escaped being suffocated and burnt to death. Vaughan was no sooner pulled up on deck than there was a great explosion of a cask of turpentine; and after this catastrophe, it seemed as though the fire got the better of the water and labours of the crew. The smoke got denser and thicker, and it was almost impossible to stand or breathe on the fore-castle; and though soldiers and sailors, officers and men, vied with each other in endeavouring to stifle the flames, it was evident that the fore-castle must very soon be vacated. At this juncture, Captain Benbow ordered Clerc and the quartermasters and midshipmen to get the covers off the boats, and in case they were wanted, have all ready for lowering. In spite of all efforts to subdue it, the fire seemed fast increasing and to have already reached the fore-hold. The second mate was to the fore everywhere; he had been down the hold with wet blankets, endeavouring to stifle the flames, which were issuing from the mass of burning pitch, tar, oil, &c. But wherever the second mate was, or whatever he did, Vaughan seemed to rival him.

At the request of Captain Benbow, Colonel Boyle had placed sentries over all the boats, with orders to use their bayonets upon the first man who attempted to get into them without orders. On the main-deck, although flooded, the heat was almost unbearable. Still the clank of the double action main-pump was heard, and troops and sailors vied in keeping this going. Through the exertions of Vaughan, who seemed to work with the energy of three men, the powder had been found and reached, and he and a number of men were busy passing it on deck and throwing it overboard. There seemed to be some hope of saving the vessel, when, without any notice, and with a terrific crash, the foremast fell over the side; and with a roar, accompanied with dense clouds of smoke, the fore-part of the vessel burst into a sea of flame, which, seizing the rigging, ran along the shrouds and stays. There were five men in the fore-top when this occurred. The capital discipline which had up to this been maintained was now at an end. When the foremast fell, there was a general rush

of troops and sailors to the poop; the sentries were swept away, and there was a cry for the boats. Captain Benbow, who was on the poop, now gave the order to get the ladies and children into the boats, and with a ship's pistol in his hand, declared that he would shoot the first man who commenced rushing. The ladies were mostly huddled together on the poop, many of them in tears, and several of them were praying. Several of the soldiers' wives crowded round the captain and implored him to save them. Said Captain Benbow: 'All depends on my orders being obeyed. I trust that everybody will be saved, and I shall stay and see all in the boats myself.' But there was no time to be lost. All canvas had now been taken in, and the vessel rolled heavily. Some of the men who had been passing up the powder, had broached some of the cases of liquor, and were almost mad with drink.

'Lower the starboard boats and pass them astern,' shouted the captain to Dodman, the third officer; 'pass the ladies through the stern-ports.' The sentries did their duty, and were gallantly supported by Colonel Boyle and others of the officers. The chief and second officers were still working with some of the crew to keep the flames forward, so as to allow the passengers time to get into the boats. As the breeze was moderate and the weather fine, the boats, with the exception of two, which were lying bottom up and on the skids, and were burnt, were lowered in safety; and under the supervision of Captain Benbow, and owing to discipline, coolness, and example, there was not one life unnecessarily or unpreventably lost. There was a beaker of water in each boat, and most of the soldiers had filled their canteens with water. It was now about 7.30 p.m., when, having fought the fire for three hours, troops and passengers commenced embarking in the boats. A raft was also being constructed by the boatswain, carpenter, sailmaker, and a number of the sailors, when all at once a panic seemed to seize both soldiers and sailors: the flames had seized the main-hold, where there was still powder, and one of the men said that in five minutes they would all be blown up. Vaughan was still working in the main-hold, when the men who were with him, and who were sober, suddenly left him, and rushed on deck, and began to make for the boats which were towing astern. The instinct of self-preservation seemed taking possession of officers as well as troops, especially when it was apparent that there were not sufficient boats; and among the males especially, every one was afraid of being left behind; and to this fact, and the fear of being blown up, must be attributed the absence of discipline which now unhappily prevailed. Dodman, assisted by two of the military officers, was calling out the names of those that were to get into the boats; but many of the troops and sailors, in spite of orders or threats, slid down the tackles and jumped into the already crowded boats. The gig was a small four-oared whale-bout calculated to hold eight. This the captain ordered to be reserved, intending it for Miss Talbot, himself, the midshipmen, and the ship's papers. From the observations taken that day, we were in lat. 33° 10' S., long. 17° 20' E., or about the latitude of the Cape. Mrs Boyle suddenly called to Miss Talbot, who was standing by the stern rail, that the colonel had reserved a seat for her in the lifeboat, and begged her to come at once before it was too late.

The captain answered for her, and said: 'She will go with me.'

Captain Benbow, as became the man and his name, declined to leave the vessel until all were embarked in the boats. He seemed dejected; but it was enough to make any man sad. This was his last voyage, and with a long experience at sea, this was the first time that he had ever lost a vessel. He had, too, on board all his silver, and a valuable collection of charts; and then there were the chronometers and ship's papers. These last *must* be saved. The gig was still hanging to the stern davits, when the captain turned to Miss Talbot, and said: 'Here, Blanche, get into the boat; don't be afraid!' and he helped her and Mrs Silver to their places.

Mr Blake reported: 'We have launched the raft, sir, and I think you have done all that can be done.'

'No,' answered the captain; 'I must have the manifest and chronometers. Blake, see the ladies safely lowered, while I go and get them; and let the quartermasters get in, and have all ready for pushing off.'

They were shouting from one of the boats: 'Chief officer wanted on board.' Blake, however, stuck to the captain; and after lowering the boat with the quartermaster, he ran down the stern companion-ladder to help the captain with his chronometers. He had no sooner descended, than Vaughan came rushing across the poop as if possessed, and shouting to the quartermaster who was waiting for the captain: 'Over for your life!' jumped overboard. He had scarcely disappeared, when an explosion of a terrific nature was heard; and a long spiral pillar of smoke and a terrific flame of fire shewed that powder in the hold had taken fire, and that Captain Benbow had found his funeral pyre on board his own vessel. At the same moment the mainmast fell lengthways on the poop. The flames had now caught the cabin, and were issuing from the ports. Vaughan had no sooner jumped overboard, than he was quickly on the top of the water again, and was pulled into the boat by two of the midshipmen. 'Pull round to the quarter,' he said; 'the captain will be burned alive.' They hauled the gig under the captain's port. 'Captain Benbow!' shouted Vaughan. There was no answer. The quartermaster also hailed with the same result. 'Good heavens!' said Vaughan, 'he will be burned alive. Captain Benbow!' he roared out again; and getting hold of one of the davit-falls, hauled himself up, and looked through the port of the captain's cabin. There was no sign of him: the floor was strewn with charts; two of his chronometers were missing.

'Is he there?' called Miss Talbot.

'The cabin is on fire,' returned Vaughan, 'and he went in that last explosion. There was all the ship's powder in the lazarette.'

There were two midshipmen and two quartermasters in the gig. The boats and raft were so crowded that it was impossible to hoist a sail or to use the oars. In the long-boat, in which were the colonel, his wife, the judge, and several ladies and officers, besides a number of soldiers' wives, it was impossible to move, much less to row, and the boat lay like a log upon the water. This boat was to have been commanded by the first mate, but as that officer had perished with the captain, the third officer, Dodman, took command of her.

In the gig, Miss Talbot and Mrs Silver sat in the stern-sheets. Miss Talbot seemed much distressed, but Vaughan assured her that they were in the track of vessels; and hoisting the lug-sail, the whale-boat began to skim along, a course being shaped for the Cape.

The *Bangalore* was now almost burned down to the water's edge, but every now and then the flames burst out afresh. Mr Sparks, who was in charge of the cutter, ordered the boats to keep near the burning vessel, thinking that if any vessels were in sight, they must be attracted by the flames. No one knew that the captain was not in the gig. The ladies and women suffered great discomfort from crowding, and all were longing for daylight. It was about 4 A.M. when one of the cutter's men shouted: 'Steamer's lights ahead!' There was much excitement at this announcement, and the men involuntarily gave a cheer. In a few minutes the three lights of a steamer were now distinctly visible, and in about fifteen minutes she was almost abreast of us. On she came, with a stately, steady swing, the steam roaring from her pipes, and lights shining from her port-holes. She was steering for all that remained of the *Bangalore*.

With the exception of the captain's gig, all the boats were picked up, and the castaways were embarked on board the steamer, and treated with the humanity usual on such occasions. The steamer put back to Table Bay; and upon her arrival there, and knowledge of the cause, the greatest rejoicing and excitement prevailed at the merciful deliverance from what threatened at one time to be a dreadful catastrophe. There were missing the captain, chief officer, Miss Talbot, Mrs Silver, two midshipmen; and about twenty of the troops, petty officers, and sailors. These last were supposed to have helped themselves to the cased spirits in the hold, and drunk themselves to stupor, and perished in the flames.

No sooner were the crew and passengers landed, than they began to talk among themselves as to the origin and cause of the fire; and the boat-swain, who was one of the saved, told his story about ordering Vaughan to get the tar from the forepeak; and the second mate did not scruple to aver that it was purposely done by Vaughan, to get clear of the vessel, and revenge himself for his punishment.

Vaughan in the meanwhile was in charge of the gig. He took the tiller, and seemed to have such confidence in himself, and to know so well where he was, that both the ladies were reassured. Whatever happened, he made the best of it, and almost seemed to make light of their misfortunes. He said that they were in the track of vessels, and that if they were not picked up, in two days he would make Table Bay.

We had been in Cape Town some two days, when the *Marlborough* Indiaman, outward-bound from London to Calcutta, brought up in Table Bay, having picked up the boat containing Miss Talbot, Mrs Silver, and the quartermaster. Vaughan had navigated the boat so well, that when picked up, he was only one day's sail from Simon's Bay. He narrated the history of the burning of the vessel, and death of Captain Benbow and the chief officer. The captain of the *Marlborough* knew Old Bobus well; and when he heard that the young lady who was saved was the daughter of

a judge, his politeness and attention were very marked. Miss Talbot attracted as much attention on the *Marlborough* as she had done on board the *Bangalore*; and on arrival at Table Bay, the news soon spread of the missing gig having been picked up, navigated by Mr Vaughan. For the short time that Vaughan was on board the *Marlborough* he was a great favourite; by the ladies he was looked upon as a hero of the most approved type; while the officers envied him in having rescued such a young and charming lady. Directly the *Marlborough* came to anchor in Table Bay, she was boarded by Colonel Boyle, his wife, and the judge, who had come to look after Miss Talbot and Mrs Silver. The colonel took Vaughan on one side, and although congratulating him on having safely brought the gig and its occupants through their dangers, told him that there were some ugly stories afloat of his having wilfully set the vessel on fire, and that the papers had published the account.

'However,' said the colonel, 'we shall all be glad if you can exonerate yourself.'

Miss Talbot, who overheard this remark while talking to Mrs Boyle, burst into tears, and said: 'Colonel Boyle, you little know how nobly Mr Vaughan has behaved, or you would be one of the last to credit such things.' And Mrs Silver vowed that she never could forget his having saved their lives, and his noble attention and delicacy. The colonel and his wife were disposed to be friendly to Vaughan, although many of the passengers and crew were wroth at having lost all clothes and possessions, and were anxious for him to be brought to justice. They took Miss Talbot and Mrs Silver with them to their hotel. Arrangements were made for forwarding as many of the *Bangalore's* passengers as possible to Calcutta by the *Marlborough*, which was to sail in three days; and many of the officers and passengers were occupied in getting fresh outfits.

There was at this time lying in Table Bay a French transport, *Le Cerf*, which had put into the Cape, being short of water, and having lost a number of her men with small-pox. On board this vessel Vaughan at once enlisted. He spoke French well, and as the transport was on the point of sailing, and was short-handed, there were no objections raised by the French officers. That day, a warrant was issued for his apprehension, on the charge of wilfully setting fire to the *Bangalore*, and causing the loss of the vessel and the death of a number of people. All the hotels were searched, all the resorts of sailors, but without success. Indeed, there were some who did not scruple to say that the colonel had helped him, and that he had gone into the interior, to avoid being sent prisoner to England.

The crew and officers of the *Bangalore* were forwarded home by steamer; and the death of Captain Benbow created much discussion among shipping circles in London, and the underwriters raised difficulties in paying the vessel's insurance. Advertisements were inserted in the *Times*, and principal papers in India, Australia, and the Cape, with a description of Vaughan, offering a reward for any information respecting him. The reward, however, was fruitless: nothing was seen or heard of him. Meanwhile, in due course, the *Marlborough* arrived out safely at Calcutta; and Miss Talbot was met at the Sandheads by her father the judge, who went down the Hooghly in a tug-boat

to meet her. He was introduced to Colonel Boyle and his wife, and was much shocked to hear of the death of his old friend Benbow. 'I should have liked,' said he, 'to have seen and thanked that young fellow Vaughan, to whom I feel I owe my daughter's safety.'

Miss Talbot had not been long in India before she was, as predicted, not only a favourite at Government House, but the acknowledged belle of Chowringhee. She had many offers; and within a few months after her arrival, made a brilliant marriage with a civilian of high standing, though twenty years older than herself. The marriage was brought about by her father.

It was about twelve months after her marriage, that Lady Goldsack, late Blanche Talbot, the admiral and lovely wife of Sir Parkie Goldsack, was reclining in her canoe-shaped carriage at the Band Stand of the Eden Gardens at Calcutta, listening to the band of the Highlanders, and also to the compliments of several admiring civilians and military officers, when her eye fell upon the figure of a young man dressed in black, remarkably good-looking, with a profusion of dark curly hair. There was no mistaking him; it was Vaughan, well-dressed, and looking, if anything, better than he ever did before. He had been calmly watching Lady Goldsack from a short distance for the last ten minutes, when a syce, in a handsome livery, came up, and making a salaam, said that the Burra Mem Sahib desired to speak to him. He approached the carriage, and after being very warmly greeted, gave an account of himself from the time he left Lady Goldsack at Cape Town. He had, he said, at the risk of being shot, deserted from the French transport shortly after her arrival at Pondicherry, and managed to get a passage to Calcutta on board an Arab *macoda*, and had, as soon as it was in his power, kept his promise to meet her in Calcutta. He expressed his surprise to hear of her marriage, but what followed need not be recorded. Suffice it to say, that, through Lady Goldsack's influence, Vaughan was speedily advanced to the command of a steamer of the inland service of the Bengal marine.

He would doubtless have obtained other advancement, had he not been recognised in Calcutta, and warrant for his arrest obtained by the agents of the *Bangalore*. The particulars of his arrest, as reported by the *Englishman* and *Bengal Hurkaru*, attracted much attention in Calcutta. On the case being tried in London, the only important evidence against him was that of the boatswain; and as there was no actual proof of his having wilfully set the vessel on fire, Vaughan was acquitted. The owners did not press the charge, and for the loss of an old vessel obtained the price of a brand-new ship.

The owners, who were interested in Vaughan, offered him an officer's berth in their fleet. This offer he declined; and having signified his intention of proceeding to Calcutta, they presented him with a free passage to that port. On his arrival there, he enjoyed the friendship of Lady Goldsack and her husband until his death, which happened in the well-remembered cyclone of 1864. The steamer which he commanded, when full of passengers, foundered in the Bay of Bengal on her homeward voyage from Rangoon, not one soul surviving to tell the tale. Among the many

monuments in the Hourah Cemetery is one remarkable for its classic simplicity. At the base there is a profile medallion in marble, and underneath are the words, 'In Memoriam DESMOND VAUGHAN, drowned October 1864. "And the sea shall give up its dead."' The work was executed in England; and when completed and placed in position, a lady, accompanied by an elderly gentleman, came to look at it. She seemed much affected, and left a wreath of immortelles at the foot of the monument. Lady Goldsack when last heard of was at Simla, and was a centre of attraction at that well-known hill-station. She has no family, but has apparently recovered the effects of her first romance. Yet among her private possessions, and not the least valued, are two water-colour drawings: one a portrait of herself, and the other a landscape. Both are signed 'D. V., BANGALORE.'

THE MONTH:

SCIENCE AND ARTS.

THE good ship *Challenger* sailed from Monte Video at the end of February, and will probably arrive in England next month. Her voyage has hitherto been eminently successful; and when the details of her three years of exploration come to be published, the additions to our general and scientific knowledge will be surprising. A Report from Professor Wyville Thomson to the Hydrographer of the Admiralty, was recently read at the Royal Society. Among many interesting facts, the Professor states that, in company with one of the lieutenants, he visited the crater of the ever-active volcano Kilauea, in Hawaii. From a ridge they beheld the two lava lakes which have been boiling for many years without change. 'We were greatly struck,' he says, 'with the fluidity of the melted lava, which washed about with very much the appearance and sound of water. The night was perfectly still; and the two glowing lakes tossing like the sea in a storm, and a red surf dashing against the encircling rocks, and springing forty or fifty feet into the air in wreaths of fiery spray, produced a strangely impressive spectacle.'

In another place, Professor Thomson touches on a question which has been much debated of late—namely, the circulation of the water throughout the ocean: the presence of cold currents especially has been made a subject for theory. 'I am every day more fully satisfied,' argues Professor Thomson, 'that this influx of cold water into the Pacific and Atlantic Oceans from the southward is to be referred to the simplest and most obvious of all causes, the excess of evaporation over precipitation in the northern portion of the land hemisphere; and the excess of precipitation over evaporation in the middle and southern part of the water hemisphere. After this I need scarcely add, that I have never seen, whether in the Atlantic, the Southern Sea, or the Pacific, the slightest ground for supposing that such a thing exists as a general vertical circulation of the water of the ocean depending upon differences of specific gravity.'

This calling in question of a theory of ocean currents, reminds us that the discovery of the first of fossil animals has also been questioned. It is not very long since that a description was published of the *Eozoon Canadense*, or Dawn-animal of Canada, so named because it had been discovered, as the finder announced, in the serpentine rock of Canada. That shapeless creature was supposed to be the earliest form of organic life; hence its name. But now a learned German, Mr Otto Hahn, after painstaking investigation, shows that the naturalists who accepted the *Eozoon* suffered from a *deceptio visus*, and that all the appearances which they took to be evidences of animal structure are really proofs of mineral structure. Of course there will be a discussion; but thus it is that the truth is finally discovered.

Certain experimentalists in the United States think they have discovered a 'new force,' and after a series of test observations, they come to the conclusion that it is a 'radiant force, somewhere between light and heat on the one hand, and magnetism and electricity on the other, with some of the features of all these forces.' Will the conclusion be accepted by physicists on this side of the Atlantic?

Mr Prestwich, Professor of Geology at Oxford, has published his lecture on the water-supply of that ancient town, which is worth reading by all persons who do not like to drink diluted sewage, and who desire to know the geological conditions which should be taken into account in choosing a site for a dwelling-house or for a town. In too many instances the conditions have been entirely disregarded, and ignorant builders dig wells and cesspools side by side in a porous soil, as if for the purpose of poisoning the water. This abuse, as Professor Prestwich points out, is 'common to the whole kingdom. It prevails in crowded towns, in sequestered villages, in isolated country houses, and in princely mansions.' The obvious remedy is to bring pure water from a distance. It appears that there are in the oolite district above Oxford, springs which yield about sixty million gallons of good water every day, while other springs in the chalk escarpment of Oxfordshire and Buckinghamshire pour out thirty million gallons.

As regards the royal river—Mr Prestwich informs us that 'the Thames water contains more organic nitrogen at Lechlade than just above Oxford; less again at Abingdon; more below Reading, and then a decrease to the Oxford standard at Windsor; while at Hampton, the river was found to be chemically purer than at any other part of its course.'

Dr Acland, also an Oxford Professor, has delivered a lecture on 'The Relation of Modern Engineering to Public Health and Local Government,' in which he draws a picture of Oxford that makes one shudder, for the conditions were such that at any moment there 'needed but a chance combination to decimate the town with typhoid.' Referring to the water-supply, he mentioned that he had once walked 'along the whole length of the splendid aqueduct on the north coast of Africa, which, taking its rise on the hills of Zagouhan, supplied a vast stream to Udina and to Carthage. . . . It is remarkable that round [the headwater] a spacious and solid edifice was raised, shewing with what religious care the

source of the water-supply was protected from contamination.'

Dr Acland believes that the task of providing a healthy home for every man, rich or poor, remains as a crowning triumph for the civil-engineer. But he says: 'For my own part, I retain the conviction of many years, that the true policy for securing the national health lies in the steady education of the people to take a thorough intelligent interest in perfecting, under local management and central or imperial advice and supervision, their local sanitary arrangements. I am more convinced than ever that coercion, even if attempted, will in the end retard progress.' Some remarks on sanitary reform will be found in another article, 'The Poor of London.'

There is something in the last Annual Report of the Registrar-general on births, deaths, and causes of death in London in 1875, which completes, so to speak, the preceding statements. The quantity of water supplied to London in that year was nearly five hundred and thirty thousand tons every day, being three hundred and sixty-eight tons a minute. In one hundred thousand tons of the water so supplied, there are from twenty-seven to forty tons of other matters; and it is these other matters that are to be guarded against. 'Soft water,' says the Registrar, 'is the most suitable for ablution, washing, cooking, and all domestic purposes; but for other purposes hard waters answer sufficiently well. There is no proof that small quantities of the saline matters in the Thames and Lea are actively noxious as drinking-water; but it is the organic matters from sewers, especially in the form of ova of worms, cells of typhoid fever, of cholera, smallpox, scarlet fever, and other zymotic diseases, that are to be dreaded. For these zymads the living organism is the only known test. Neither chemistry nor pathology, armed with the most sensitive taste, and with the highest powers of the microscope, has yet succeeded in distinguishing these bodies from each other, or from ordinary animal excretions. So the right policy for a town is to secure sufficient supplies of water as pure as possible.' Not a doubt of it. But why do not some of the young experimentalists, who, as we are told, are pining to distinguish themselves—why do not they set themselves to discover a way by which those deadly 'zymads' can be detected and identified?

Londoners pay yearly £1,131,023 for water, and £2,981,389 for gas and meters: a total of more than four million pounds sterling. The net profit made by the gas and water companies is £1,627,454. If London would only do what some provincial towns have done, and supply itself with gas and water without the help of companies, the great city would save one half of its present enormous outlay for those two articles. But London having nearly four million inhabitants, is very sluggish in matters municipal.

Flood-water means muddy water; and some rivers are always muddy, to the great inconvenience of the people who are dependent on them for water-supply. It is of little use to attempt to filter this muddy water: the first thing to be done is to make the mud fall to the bottom. This can be done by mixing with the water a very small quantity of chloride of calcium, or of caustic lime; the mud then speedily settles at the bottom, and the water can be readily filtered. A small provi-

sion of either one of these substances, by travellers and new settlers in wild countries, would save them at times from the necessity of drinking foul or noxious water.

In a paper read to the Philosophical Society of Manchester, Dr Angus Smith has called attention to peat—a natural product which appears to have been too much neglected. Regarded from the economic and sanitary point of view, peat is valuable as fuel; it contains oils and resins; it grows rapidly when properly cultivated, and could thus be used to fill up wet grounds and swamps. And further, it removes swamp-fever, which, according to Dr Smith, 'was never found, at least in the northern peat-bogs,' and never, as he believes, 'in the true peat-bogs.'

We are further informed that peat grows more combustible matter in an acre than forest trees do, and it is argued that in parts of the country where coal is dear and land of small value, peat might be grown with great advantage, and in time black peat-bogs would 'become for us rich coal-fields, oil-wells, and whale-fisheries.' As is well known, some peat-bogs hold large quantities of water, as a sponge; and Dr A. Smith suggests that 'water-reservoirs could be grown at a cheap rate, instead of being banked in or dug at a great expense. A reservoir formed of peat ten feet thick would hold as much as a water-reservoir seven and a half feet deep, and still be easily walked over.'

The President of the Manchester Scientific and Mechanical Society pointed out in a recent address that numbers of young men might benefit themselves by becoming members of the Society. The faculties of individuals are often lost for want of opportunity for development or exercise. The Society affords that opportunity. 'Besideas,' said Mr Leigh, 'every man has a far better chance of making his way in the world indirectly, if he is known to belong to a Society like this. It stamps his respectability; it shews him to be a man of superior understanding. It is a passport for him either in matrimony or to a situation of trust. Places are continually falling vacant in every great commercial city, and are always filled by men of this kind, who are naturally selected in preference to others.'

If air be suddenly rarefied, the consequent lowering of temperature occasions precipitation of the watery vapour which may be present, in the form of cloud. But there are conditions under which cloud cannot be produced: when the vessel containing the air has been standing for some time undisturbed, and when the air has been burnt or filtered. It seems that there must be floating particles of some kind in the air, in order to produce the formation of cloud; and readers who have bestowed attention on the recent discussion of the Germ theory, will see a relation between motes being necessary to produce disease, and floating particles visible or invisible being necessary to produce cloud. The question is curious, and requires further investigation.

Professor Alexander Agassiz records a series of observations on hermit crabs, which may be interesting to general readers. He reared a few of the creatures from their youngest stages to the time when they require a shell for their protection and further development; and took pains to watch their behaviour when shells were first placed in the glass dish in which they were living. 'Scarcely,'

says the Professor, 'had the shells reached the bottom before the crabs made a rush for them, turned them round and round, carefully examining them, invariably at the mouth, and soon a couple of the crabs decided to venture in, which they did with remarkable alacrity; and after stretching backward and forward, they settled down into their shells with immense satisfaction.' Others of the shells contained a living mollusc, and the crabs which could not find an empty shell, waited till the molluscs died, when they tore them out, devoured them, and immediately took possession of the shells. Professor Agassiz questions whether this is to be regarded as a case of instinct. On the subject of hermit-crabs, some interesting observations will be found in an article in this *Journal*, entitled 'Curious Companionships.'

Mr J. A. Broun, F.R.S., has been investigating the effect of the sun's rotation and the moon's revolution on the earth's magnetism. The effect is variable, and depends on the position of the moon, as well as on the movement of the sun. Cuses have occurred of large and sudden diminutions of the earth's magnetic force, and these are found to fall at intervals of twenty-six days, which is about the time of the sun's rotation on its axis. Mr Broun thinks that there is some ray-like emanation from the sun, which causes these changes in the earth's magnetism; and he finds that the moon has something to do with them, for they occur mostly when she is farthest from the equator.

Professor Perrey of Toulouse has devoted many years to the study of earthquakes, and has communicated the results to the Académie des Sciences at Paris. In his last Report he states that there are more shocks at new and full moon than at the quadratures, and that, of the earthquakes reported between 1843 and 1872, 3290 occurred when the moon was nearest to, and 3015 when she was farthest from, the earth.

A WORD ABOUT 'THE DRAW.'

WE have been amused by receiving the following note from a correspondent on the power of 'Draw.'

'In *Chambers's Journal* for May 30, 1874, appeared an article entitled "A Draw," dealing with the great evil of giving money in charity without sufficiently considering whether those people for whom the charity was intended will benefit by it; and pointing out how, in very many cases, so far from relieving the necessitous, the effect is that you really are encouraging laziness and roguery.

'A striking example of this danger came across my notice some years since, when I was chairman of the Out-relief Committee of the City of London Union; and as it goes far to confirm the opinions expressed in the article, I venture, though rather late, to trouble you with this description. It is the custom at the casual-office to give some temporary relief to applicants who are supposed to be on the tramp from one parish to another in search of work. One of these paupers while receiving relief was suffocated by a piece of bread sticking in his throat. An inquest was held on the body, and the jury, in giving the verdict, expressed an opinion that it was cruel of the guardians to provide nothing but dry bread for the poor. At the next meeting of the Board, much doubtful philanthropy being

talked, an order was passed that, in future, all casuals applying at the out-relief station were to be provided with a basin of hot soup besides the usual allowance of bread.

'The Scotch gardener was not far wrong when he said, that wherever there is a pond there will be frogs; and here was established a pond of soup, and to it came hurrying from all parts of the metropolis shoals of human frogs. In a short time the number of candidates for this new luxury so increased, that it was necessary to more than double the staff at the office, and men were at work from morning till night serving out soup to an endless string of applicants. As this soup had to be brought from the workhouse at Bow, the expense to the ratepayers may be imagined. In a short time these "poor people" became dangerous, and there was no other alternative but to remove the "draw." I need hardly say that the number of applicants for relief lessened daily. To prove how little this kindness on the part of the guardians was appreciated by those benefited by it, I will add that I was informed by an officer of the Bethnal Green Workhouse, who was a candidate for a vacant office in the City of London Union, that he heard men (casuals) bragging that they had had soup five times in one day by the simple expedient of changing coats and hats! The office in Northumberland Alley they named the "Luncheon Club!" and merely laughed at the guardians for their simplicity. It is scarcely necessary to add that a like philanthropical experiment has not been attempted since.'

T O ———

How tenderly my bosom heaves,
When thou, dear maid, art near to me;
My heart beats twice for every thought
I have of thee.

I dare not ask thee to my dreams
Some little meed of hope to deign:
I could not love thee more, didst thou
Me love again.

But with ennobled thoughts and pure,
I see thee pass thy onward way;
Content if for thy welfare I
May only pray.

Then still, sweet maid, the guerdon rare
Of noblest womanhood be thine;
Until at last thy heavenward feet
Reach God's own shrine.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notices:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.
- 4th. MS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

PRICE 1½d.

NAME-LENDING.

WHEN a man finds himself advancing in the world, and getting a little towards the front, he begins to discover that his name is in request for the purpose of sanctioning a great variety of objects with which he has no proper concern, or at all events cares little about. He is asked to allow his name to be put into lists of committees, managers, or patrons of schemes good, bad, and indifferent; some of them speciously philanthropic, others as speciously commercial and advantageous. To render requests of this kind agreeable, an assurance is perhaps given in a polite and considerate way that no personal trouble will be involved, no responsibility incurred. All that is wanted is a loan of your name. It would be a great favour if you would permit it to be used along with the names of a great many other persons of high station who have obligingly consented to let their names be employed on the occasion.

At first, there is felt to be something flattering in the request. You are made aware of being no longer an obscure individual, but a person of some note. Then arises the pleasing thought of seeing your name flourishing in a list of people of rank and title, such as earls, baronets, and lieutenant-generals. The prospect is very inviting. There is to be no pecuniary responsibility, while something may be reaped as regards popularity. And it is so *very* hard to refuse a request couched in terms so courteous and respectful. Accordingly, from these and other considerations, you allow the use of your name, and possibly give yourself no further trouble in the matter.

There can be no doubt that in innumerable instances, no injury whatever is sustained from the lending of names, while, on the contrary, much good may be effected. The practice, however, of giving your name to projects of which you know but little, and over which you exercise no sort of supervision, appears to us to be objectionable in principle. As is seen by almost daily experience, it is fraught with dangers absolutely appalling. By indiscreetly allowing names to be

employed in schemes of a visionary, or it may be fraudulent, nature, not only fortunes but reputations are sacrificed beyond recall. Cases of this nature are becoming so clamant as to invite a consideration of the whole system of name-borrowing and lending. Public morals as well as private sufferings are conspicuously concerned in the question.

There can, we think, be but one proper rule of action. That is, on no account to give your name to any project whatsoever unless well assured of its integrity, and unless you are able to exercise some control over the proceedings. Merely to give your name, and take no part in the way things are conducted, is to run unnecessary risks; for you cannot tell how things may be mismanaged, and how your reputation may be less or more compromised. You, in fact, leave matters to chance. At the best, you allow yourself to be put forward as a lure - a bait to catch some paltry patronage for a thing which ought in justice to stand on its own merits. Such seems to us to be the true view of the matter: names to be given only to what is ostensibly creditable, and to what the owners of the names give also a fair share of personal attention. Of course, the refusal of your name must, in a variety of cases, be far from agreeable. You can clearly see that you will be set down as a savage, or at least a very eccentric personage, who does not readily fall in with the fashions that prevail in society. Very hard, truly, to feel that you are warring against the edicts which prescriptively hold rule in Vanity Fair! Yet right is right, all usages notwithstanding. And is it not better to suffer a little present inconvenience than the future twinges of conscience, or a loss of self-respect? Out of false shame, to do what you know to be wrong, is to act under the most pitiful of all motives.

Properly considered, one's name is to be deemed more precious than his money. He who steals our purse, as Shakespeare observes with proverbial wisdom, steals trash, but he who filches from us our good name, makes us poor indeed. Yet persons are often not only regardless of the appropriation

of their name, but voluntarily contribute to the depreciation of what they should hold in so much esteem. It cannot escape notice that a name which is lent on all occasions ceases to be thought much of. Seen times without number in connection with a multiplicity of affairs, the public come to treat it with ridicule and indifference. It is a name—perhaps a good name—weakly thrown away. The truth of this may be pressed on the notice of kind-hearted people who are apt to come frequently before the public with complaints as to something which needs to be redressed. Their name gets so hackneyed, that when they have to remonstrate on matters of serious concern, nobody minds what they say. They have damaged a good cause by habitual indiscretion. A wise man nurses his name, and employs it—or allows it to be employed—only with the strictest regard to propriety. By a disregard on this point, a man is apt to become known only as a rash enthusiast, a buffoon—or a fool.

We happen to have known some amusing instances of persons of title making a kind of business of lending themselves out to dinner-parties. The borrowers were usually tradesmen who affected to have high-class acquaintances. They wanted a titled name to be shouted out when the honoured guest entered the drawing-room, and to have the pleasure of often addressing him by name at the dinner; as, for instance: 'Allow me to help your lordship to a slice of the turkey.' Or: 'Will your lordship be pleased to take a glass of that dry champagne? genuine Louis Roderer, Carte Blanche.' In London, some years ago, we knew a baronet in somewhat decayed circumstances, who dined out daily in houses where the host was glad to have him for the sake of his name. Another case which came to our knowledge was that of a lord with a fine sounding title, who may be said to have got his clothes for nothing from a fashionable West End tailor, on the understanding that he was to dine at the tailor's house when invited on any special occasion. Woe be to his lordship if he ceased to accept the invitations! A tremendously long bill running up as high as four figures, would soon have been brought unpleasantly under his notice. Such may be deemed melancholy specimens of men of good social position trading on their name. No doubt, hundreds of such cases are familiar to fashionable diners-out, as well as to the *habitués* of evening-parties. In fact, at the west end of the metropolis, beginning, say, at Berkeley Square, you are never sure that half the people you meet at these parties are not invited for the mere sake of their high-sounding name. We need hardly say that the hosts are of the parvenu order, whose aim is to make character by the distinguished names of their guests. It will be recollected that Mrs Hudson, wife of Hindson the 'Railway King,' who, in his latter days, was supported by charity, had the amazing tact to entrap the Duke of Wellington—the Great Duke—for one of her magnificent evening-parties. A splendid catch of a name that, seldom equalled before or since.

From the small sin of heedlessly lending names to float off balls, fancy-bazaars, and such-like petty affairs, there is a considerable stride to floating off and abetting a class of undertakings which involve a loss of many thousands of pounds to the poor dupes who are allured by false representations to their destruction. Here, the indiscretion rises to a participation in crime. Silly lords and baronets, members of parliament, officers in the army, and clergymen, possibly in the hope of securing some little pecuniary advantage, become the associates of swindlers, and condemn themselves to life-long regret, along with the consciousness of social disgrace. Is this not true? Can it be denied that apparently at requests preferred in a few smooth words, and from the miserable bribe of a guinea, or so, for attending meetings of directors, men of hitherto unstained character are known to imperil not only available means, but the precious reputation of themselves and families? Sad climax in an honourable career, to sink to the position of what is facetiously called a 'Guinea Pig!' Yet, that is too frequently done, if not from necessity, at least from choice. London is full of these Guinea Pigs, or Name-lenders. They swarm everywhere. They are seen in the grandest houses. Connected with dozens of schemes got up to pick money from the pockets of too-confiding investors, they seemingly realise an income, such as it is, from the business of name-lending, which in the ethics of fashion is not deemed particularly scandalous. Think of a man who lives by the wages of systematic plunder, figuring within, or upon the verges of, Mayfair, as one of the reputables of society!

But beyond this there is a loftier vision. It is a contemplation of that magnificent class of 'Promoters,' men who devise and float projects, to whom the small-minded Guinea-Pig order of beings are slavishly subservient. Among this exalted class who far and away take the shine out of Englishmen is a colony of German adventurers, who, struggling manfully away from indigence in their own country, and with abilities more intellectually acute and varied than morally sensitive, carry all before them in the profound art of money-making, no doubt to the extreme disgust of their more soberly disposed countrymen. Their names may sound harsh to English ears, and not very suitable 'to conjure with,' but what more easy than to change a name in adaptation to ordinary conceptions! The German names are accordingly anglicised, and for the most part in that ingenious way that preserves the initial letters. Change of name may not in special cases be unreasonable. It is, however, a very different thing if names are altered for certain purposes connected with the floating of questionable schemes on the Stock Exchange, in which Germans happen to be peculiarly proficient.

To this race of enterprising foreigners, England has offered a favourable field of operation. The floating of foreign loans has obviously been brought to a high state of perfection under their auspices, in conjunction with the facility for deception on the Stock Exchange. There is, however, another species of flotation in which Promoters, native and foreign, shew a masterly dexterity. This consists in the art of floating Joint-stock Companies (Limited). Therein lies a perpetually welling spring of financial manipulation.

Plain ordinary business requiring painstaking industry, such as we are accustomed to, is pronounced to be slow, humdrum, and contemptible. The right thing to do is to get hold of a decent steady-going concern, and transform it into a Joint-stock Company (Limited), and by the operation clear fifty thousand pounds at a whip. One may ask how this magical result is to be effected. The answer is simple. Taking advantage of the profusion of capital seeking investment, Promoters issue a flauntingly seductive Prospectus, offering the concern in shares; they get names to futher the company as directors, which it is not difficult to do in the well-replenished market of titled Name-lenders, and the thing is done. The shares being taken up and paid for, the Promoters complacently walk off with the plunder. What is to be the reputation or the fate of the Joint-stock Company (Limited), which has thus been floated from pure greed of gain, is a matter of indifference. The end has been gained. The plunder has been safely pocketed.

That is what is styled doing business smartly, and in a way worthy of the age. The invention, as is well known, is American. Primarily, it had in view the co-operation of men with small means; but from this simple aim and organisation it has very much passed into the hands of skilled manipulators, by whose avaricious and scandalous performances, aided by name-lending, it has been grievously outraged. We would by no means say that the plan of Joint-stock Companies (Limited) is universally to be held up to derision and obloquy; but all who read the daily newspapers must know that what we have faintly pictured is too truly borne out by facts. That the more odious of this class of proceedings are greatly facilitated by persons notably respectable lending their names as directors or trustees, is unhappily beyond dispute. We have it in evidence in one of the painful cases brought into public notice, that a lady was induced to venture hundreds of pounds simply on the grounds that a clergyman whom she named was avowedly one of the trustees of the concern. One cannot but wonder at the credulity of investors in taking for gospel all that is put forth in Prospectuses. Blinded by greed, they rush onward to ruin. Their weakness, however, does not extenuate the Name-lenders who have been mainly the cause of their misfortune. In the case just instanced, the clergyman whose name acted as a decoy cannot, if he has a spark of conscience, fail to suffer the pangs of remorse for having aided in the robbery of his fellow-creatures. He was mistaken. That, presumably, is his excuse. But it is no excuse at all. He ought not on any account to have verified with his name that which was, on the face of it, ridiculous, and could on no proper grounds be substantiated. He has, in short, been as surely guilty of a moral wrong as if he had led the blind into a pit.

Whether the Legislature will be invoked to remedy the prodigious abuses incidental to the form of joint-stock partnership we speak of, seems to be doubtful. Certainly, from recent revelations in the course of proceedings before the Lord Mayor and otherwise, it is time that some effective remedy should be applied. Meanwhile, what strikes us with astonishment is the countenance given by some of the higher classes of society to the whole fraternity of Name-lenders and Promoters—apparently

from no other reason than that they live in splendid mansions and give splendid entertainments. A reform in this particular is admitted to be as much wanted as legislative interference. W. C.

FALLEN FORTUNES.

CHAPTER XXIII.—A PATRONESS.

If any one could have proved to demonstration—could have brought it home to her that Mrs Campden of Riverside had committed even so much as a peccadillo, she would have been astonished with a great astonishment. It was true, whenever she went to church—and she went thither with the utmost regularity—that she called herself, or permitted the clergyman to call her, without remonstrance, a miserable sinner. But those words are always used, or at least applied by those who hear them, in a certain parliamentary sense. Mrs Campden often thought herself miserable, but never a sinner. She could thank Heaven—people had heard her do it—that she had always done her duty in that elevated station of life to which it had pleased Providence to call her. She supported the rector, she patronised the curate, she was affable to the doctor; she not only, as I have said, went to church herself, but was the cause of going thither in others; the bread and blankets which she distributed in sufficient quantities at Christmas were reserved for those poor folks alone who attended the parish church; she did not heap coals upon the heads of those undeserving ones who attended chapel, or resisted the temptations of all places of worship equally; her right hand knew very well what her left hand was about, and neither indulged in indiscriminate almsgiving. Whatever she did, as she had justly boasted to her husband, she did upon principle—and also what she left undone. If she did not command respect, she was at least eminently respectable. That she had once inspired love in a man like George Campden was one of those inexplicable social phenomena at which we stand astonished as at a conjurer's trick; the thing has happened, for we have seen it with our eyes, but how, in the name of wonder, did it come about? Don't we see, every day, genial, good-natured men tied for life to abominable women—scolds, grunblers, affected dolls, viragos; as we see—though much more rarely—charming women mated with dullards or scoundrels. Opportunity, a limited range of choice, a pique, must be, as old Burton says, 'causes.' If there was no other class of woman in the world but that—unhappily a large one—to which Mrs Campden belonged, and if the responsibility of carrying on the human race rested with myself alone, the world would come to an end; I would never marry. If she importuned me, I should reply: 'Madam, I must decline the temptation—upon principle.' Fortunately, tastes differ; and this class of woman does get married. I believe I know—though I have not the courage to write it—how it is done.

Of course Mrs Campden was jealous of her husband; and since he gave her no cause in the way of flirtations, she grudged him his friendships. She had accused him a hundred times of letting John Dalton 'come between her and him.' When a man marries, she gave him to understand, he should cleave to his wife, and cast off all old entanglements of every description; and how he

could sit in the smoking-room talking over old times with his friend—she had no high opinion of college life, and called them ‘humiliating antecedents’—in place of retiring at a reasonable hour in well-principled company, was inexplicable to her. Of Mrs Dalton she was jealous in another way: it was impossible that the most jaundiced eye could find fault with Edith’s manner, which was the perfection of gentleness and sweetness; but she was envious of her popularity. She could not say that she laid herself out to secure the affections of her host; but she resented her winning them, all the same, as she resented her winning those of everybody else. It was wormwood to her to be obliged to confess to herself, that not only in her own household, but in ‘the county’—where, above everything, she wished to shine pre-eminent—Mrs Dalton was by far the greater favourite. Lady Wapshot had actually complimented her—Mrs Campden—upon her being able, summer after summer, to secure such charming guests as the Daltons at Riverside. ‘They are certainly the most striking family—quite too delightful,’ had been her ladyship’s verdict. ‘I am told, that except Lord Clarendon, Mr Dalton is the very best—what do you call it?—*raconteur*. I confess I am quite in love with him. Then his wife, who I should be afraid is a little consumptive, is so sweet. And then Kitty—I assure you that last season, I have been informed, Kate Dalton might have’—and then she had whispered into Mrs Campden’s ear the rumour of a very magnificent *parti* indeed.

‘I don’t believe it,’ answered that lady, a little rudely, considering the rank of her companion, and her own veneration for it; ‘at least, I can hardly credit it.’

‘You may do so, however, for I had it upon the very best authority: the *very* best, Mrs Campden—*his own*.’

Mrs Campden did not believe it any the more for this audacious corroboration; but the fact that such a story should have got abroad, and be repeated by such a person as Lady Wapshot, shewed what a sensation Kitty Dalton must have made.

Now, Mary Campden, though a little older, had ‘come out’ in the same season as Kate, and had fallen, metaphorically speaking, rather flat. It was no wonder, then, that the maternal heart was sore as respected her child’s successful rival.

As to Jenny, Mrs Campden thought there was ‘a great deal too much fuss made about that girl and her ailments;’ she could not help being an invalid, of course; but she should bow to the dispensations of Providence, and since it had pleased it to afflict her, she should be afflicted; not come into society upon a spring-couch, and carry on conversation on her back, in such a curious and alarming manner. Tony was little more than a child, and Mrs Campden did not take much notice of children; but from what she had seen of the boy, and his affection for Geoffrey Derwent, she regarded him with little favour.

Thus it happened that Mrs Campden—who had no great love, I think, for anybody save one individual—‘I can only place my love,’ she used to say, ‘where I feel respect;’ and then she would stroke and straighten herself in a very self-appreciative manner—entertained a feeling that was almost hostile towards her guests, the Daltons. She would indeed have been shocked if any one had suggested

that she rejoiced in their ruin; but since it had pleased Heaven to thus afflict them, she was not one to find fault with its dispensations. Whether her husband had appealed to her or not, she would undoubtedly have assisted them; but the pleasure that she professed to derive from it was not that of doing good, but of conferring a favour—perhaps even an obligation. She was certainly not displeased at suddenly finding herself in a superior social position to the woman whom every one pronounced perfection, and whose daughter had cut out her own in London society. If the misfortunes of our friends give us pleasure, is it to be expected that those of our enemies—of those at least with whom we have any cause of quarrel—should not be grateful to us! Undoubtedly, too, Uncle George’s well-meant intercession had done his clients harm. The only contest with her husband in which Mrs Campden had been worsted—had been silenced by the great gnaw of his passion—was upon the Daltons’ account; and she was not a woman to easily forgive those who had been, however innocently, the cause of such a disgrace.

She did not acknowledge, even to herself, that such was the state of her feelings; but over her hard and bitter nature, there had suddenly grown, as respected her unhappy guests, a hard and bitter rind. It would have been difficult for some of them to have touched her heart with pity in any case, but it had now become impenetrable to all.

‘Mamma, may I come in?’ cried Mary, in tones of quite unaccustomed flurry and excitement, and not even waiting for an answer, she came quickly into the room.

‘What is the matter, my child?’ was the quiet reply.

‘O mamma, such a dreadful thing has happened, such a shocking misfortune! Dear Katy has just been telling me that—that they are all ruined;’ and the girl broke into a sob, overcome by genuine sorrow for her unhappy cousins.

‘It is very sad, of course, my dear Mary—*very* sad,’ said Mrs Campden, smoothing the folds of her dress as she sat in her chair, while Mary stood in tears by the mantelpiece; ‘but I cannot say it is altogether unexpected. I suppose Katy did not tell you how it happened?’

‘Well, yes. It seems Cousin John’—

‘You mean Mr Dalton,’ interrupted her mother. ‘It is not on *his* side of the house, remember, that we are related to the family.’

‘Well, it seems he was taken in by some wicked people in a speculation. But, however, it matters little now, since they have lost all their money.’

‘Pardon me, my child; it matters a good deal. There are higher things in the world—as I have sometimes occasion to tell your father—than pounds, shillings, and pence. All persons who speculate are wicked; and as for their being taken in, that is what the people who lose are always ready to say. Of course, Katy would not tell you—perhaps she does not know—how much Mr Dalton is to blame in the matter; but I know. My dear, that man is a scoundrel!’

‘O mamma! Cousin John a scoundrel! That is impossible. We are all so fond of him, from papa down to the very servants.’

‘The friendship of the world, my child, we have the best authority for knowing, is not a proof of good principles.’

‘Well, he is going away—at once—to Brazil,’

answered Mary, with a fresh access of grief. Brazil seemed to the girl so far away, that the sentiment *Nil nisi bonum* applied to it, as to the grave itself. 'Katy says her mother is almost broken-hearted; and if you could have seen Katy herself just now, while she was telling me—' O mamma, fancy if papa was going to Brazil!

'I hope, my dear, your father will never put himself under the necessity of going to any such place,' returned Mrs Campden with dignity. 'I am not reproving you for exhibiting such sincere sorrow—on the contrary, it does you credit; but you should learn to put a little more restraint upon your feelings. After all, it is principle alone, remember, that should guide our actions.'

'But if Mr Dalton has acted ever so wrongly, what have his wife and children to do with it? We should pity them the more, since it is surely all the worse for them to feel that he is to blame; though, for my part, I can't think such bad things of Cousin John. I am much rather inclined to believe that that stiff, hard-eyed Mr Holt is at the bottom of it all.'

'My dear Mary, I cannot listen to this,' said her mother, rising majestically. 'Whatever we say or do, let us above all things be charitable. For all we know, Mr Holt may be a very respectable person; Mr Dalton if that goes for anything—always said he was, in his own sphere of life. He has nothing but his character to maintain him; so, pray, be careful what you say. It is very unlikely, I must also take leave to say, that so very clever a man as Mr Dalton is allowed to be, should allow himself to be taken in by anybody. However, as you were about to say, Heaven forbid that we should visit his crimes upon the heads of his unfortunate wife and children! Of course, they will have to give up their house in London—which will make us later, by-the-bye, in going to town than usual—and live in a totally different way, in lodgings somewhere.'

'They are going to live in Sanbeck, mamma; that is the one bit of good news in the whole black budget. Old Mr Landell is dead, and his house is to be 'let—' "The Nook," you know—and they are all thinking of living there while Cousin John is away. It was that dear Dr Curzon who suggested it; and won't it be delightful!'

'I can't tell that, my dear,' returned Mrs Campden with gravity, 'till I have seen how matters turn out.'

'But, at all events, mamma, we shall be able to see much more of them at Sanbeck than if they were up in town—and to do much more for them. Why, Kitty and I can run over and see one another any afternoon; and they can come and dine with us as often as they please.'

'My poor child, in your haste to be all that is kind,' said Mrs Campden, kissing her daughter's forehead, 'you lose sight of what is practicable. Your cousins will soon be very poor: they could not come over the crags to dinner at night, but must drive round by the road; and how are they to afford a horse and fly?'

'A horse and fly!' repeated Mary lugubriously. If her mother had said 'a one-horse hearse,' it would scarcely have been a more melancholy suggestion. There were two little old maids from the county town—the Misses Bilger, daughters of Sir Robert Bilger, Baronet, who had ruined himself by keeping the county foxhounds, and whose memory,

therefore, gave a certain aroma of consideration to his offspring; and these shabby-gentle spinsters used to call once a year or so at Riverside, in a one-horse fly. A more graphic description of actual poverty could scarcely have been given to Mary than this reference to that dreary vehicle which for the future her cousins would not be able to afford to hire. It brought their utter ruin home to her imagination for the first time. 'Surely, mamma, we could send a carriage for them,' said she presently, yet feeling, even before her mother's reply, that even that step would not meet all the exigencies of the case.

'Of course we could, my dear, and no doubt we should do so occasionally; but people don't like using other people's carriages, especially when they cannot afford to give a fee to the coachman. There is a sense of obligation!—'

'O mamma! what! with us?'

'I think you will find it so, my dear, unless I have quite misread Mrs Dalton's character. Whatever we do for her and hers must be done very delicately; and I have a plan in my head, which, without making them seem indebted to anybody, will be of the greatest help to them—indeed, will go a good way to restore what Mr Dalton has so wickedly squandered.'

'Oh, what is it?' cried Mary, clapping her plump hands, and quite forgetting, in her joy at the prospect of this remedy for his woes, to protest against the condemnation of her cousin. 'How nice of you, dear mamma, to have hit upon it.'

'It was only my duty to cast about for any help for these poor people,' returned Mrs Campden modestly; 'but as for the plan itself, that must remain a secret until I find an opportunity for getting it carried out.—Where is Mrs Dalton, my dear? I almost think she might have come to me herself, under circumstances so momentous.'

'Indeed, mamma, I think she is hardly equal to doing that: Kitty says she is sure she is only keeping up by a great effort. But if you would go and speak to her in her own room, I am sure she would take it kindly.'

'Then, of course, I will go, my dear,' answered Mrs Campden, rising; 'in cases of trouble such as this, it is not for a person in my position to stand upon etiquette. My cousins will find me exactly the same in every respect as though this misfortune had not occurred to them.'

As the good lady had no suspicion in her own mind but that this was a very commendable observation, it is to be hoped that it was credited to her as such in the celestial ledger; and it is but fair to add that, though never more conscious of her position in the 'county' than at that moment, she had never felt more truly affable. If you had heard her hesitating knock at Mrs Dalton's chamber-door, you would have thought it was that of a country maid who had not yet acquired confidence in her intercourse with her superiors; and the voice in which she said 'Cousin Edith, may I come in?' was the voice of a poor relation and dependant rather than of the mistress of the house—and the situation. The knock and the voice were, however, sufficiently recognisable within to send the two girls flying into Jenny's room, so that when Mrs Campden entered, she found her kinswoman and guest alone. That she had been weeping, the intruder could perceive with a half-glance, but there

were no tears in her eyes now; indeed, her wan grave face wore a smile as she rose up to meet her hostess—a gentle smile, yet not one of pleading, still less of apology or humiliation. If she and hers had been ruined by her husband's rashness, that was no business of other people, and least of all of people who looked on her husband with disfavour. She was of too fine a nature to take it for granted that her cousin had any such notion in her mind at such a moment, yet she could not forget the conversation they had held but yesterday together on board the yacht, and the expressions of opinion which had fallen from Mrs Campden respecting a certain supposititious state of affairs, which had since been actually realised. If one word of reproach against John should fall *now* from Mrs Campden's lips, his wife would well know how to defend him. If she were told *now* that he was without excuse, she would reply, that he did not need excuse, since all those who had any right to look for one were satisfied.

It was curious that so quiet and sweet a face should say all this in bidding another woman welcome, but it did say so, and that so plainly, that her visitor perceived it on the instant, and altered her whole tactics; changed front in the face of the enemy. She had intended to be patronising; but now she touched another spring in her mental machinery—which was arranged in a very handy and simple manner—and became sentimental on the spot. She began to gush.

'My darling Edith!' cried she, embracing her; 'this news has overwhelmed me quite.'

'Indeed, Julia, I hope not,' smiled the other, returning her caress, though with a little less of demonstration. 'We have had a crushing blow, but it has not prostrated us, and I hope it will not bear more hardly on our friends.'

'Ah, my dear, you are so courageous. I always said you would be the bravest of women, if a necessity arose for your being brave; though, of course, I could not foresee what a misfortune was in store for you. It is a comfort, indeed, to see you so steadfast; my only fear is that it is the excitement which keeps you up, and that, when that has passed away, and the dull sense of calamity settles down upon you— But there, why should we anticipate such a misfortune?'

'Why, indeed, Julia? Only, you should rather say, Why should *you*? for indeed I, for my part, have no intention of succumbing, as you suggest. The children'—her voice sank a little here—'have quite made up their minds to make the best of it; indeed, their cheerful submission to what will without doubt be a hard and unlooked-for fate, tells me how much we have yet to be thankful for.'

'And your husband, I hear, is going to Brazil?'

That was a deadly thrust; only a woman hard of heart and reckless of tongue could have given such a stab as that, just because she had found independence where she had expected submission. The opportunity had been chosen with devilish sagacity; she had struck at the moment when the other was weakened by that reference to her children. Even that bosom, guarded as it was by its brass of 'principle' and pride, felt a touch of natural pity as she saw the colour fade from the other's cheek; the haggard look of each delicate feature, as the shadow of the coming woe fell over it; the sense of devastation and despair.

'Yes,' answered Mrs Dalton in a low faint voice, such as tortured martyrs use who are asked upon the rack to deny their faith, and will not; 'my dear husband has to leave us: that will be the hardest thing of all.'

'But let us hope he will soon return,' said Mrs Campden cheerfully. She must indeed have been touched by the other's agony, or else she would surely never have expressed such an aspiration. 'A voyage in these days, even to Brazil, is a mere nothing. You will be occupied too—and nothing makes time pass like occupation—in getting into your new house. I have just heard that you are all thinking of becoming our neighbours at the Nook. I may truly say, in that case, so far as we are concerned, that "it is an ill wind that blows nobody good."'

'You are very kind,' said Mrs Dalton, though she did not think so. It was borne in, even upon her gentle spirit, that no true sympathy was being administered to her. The conventional phrase, the rapid stream of talk—the continuity designed to preclude any interchange of genuine feeling—the tone and manner of the speaker, all convinced her of this; yet she was grateful for such civility as was expressed, and also perhaps not displeased that the other's condolences wore such an everyday garb, since it was not necessary for her to play the hypocrite in acknowledging them.

'You will stay here, of course,' continued Mrs Campden, 'until your arrangements for entering upon your new house are completed.'

'I fear that will make some trespass on your hospitality, Julia: we are rather a large party,' said Mrs Dalton, hesitating. As a matter of fact, since her hostess had often importuned her to make a longer stay before returning to town, she had taken this offer for granted; she had not understood how, in the case of such old friends, a reverse of fortune should place their mutual relations on another basis, far less that they should commence anew.

'Don't speak of trespass, my dear Edith. In an establishment like ours, a few persons more or less make no appreciable difference; while to put off our going to London for a week or two would really make no difference to us worth mentioning.'

This was perfectly true—if it is necessary to say so of any speech made by a person of such high principles as Mrs Campden; it certainly would make no difference, as the departure of herself and her husband for town was to be delayed, in any case, for a month to come. It was only Mary who had been going up at once with the Daltons.

'From what Dr Curzon tells us,' said Mrs Dalton, 'I think we might be able to take up our quarters in the Nook within three weeks. John thinks it would not be necessary for me to return to Cardigan Place; but he will run up there to-morrow, and make arrangements for the sale, and and for securing his berth on board the vessel. It is very hard to be parted from him just now, when he is so soon to leave me; but my accompanying him would cost money, and I don't feel justified'—

'You are quite right,' broke in Mrs Campden approvingly; 'one can't begin the work of retrenchment too soon. I am so glad—though I quite expected it—to find you so wise and prudent in this matter. I dare say, my dear Edith,' added she, dropping her voice, 'you have had the courage

to look not only the present in the face, but the future also.'

'Of course, I have thought of the future—God help me! how could I help thinking of it?' answered Mrs Dalton, with just the least touch of bitterness. These platitudes of the prosperous woman were growing almost insupportable to her. 'Do you suppose that I have not reflected how ten days hence, I must stand alone in the world, with my poor children clinging to me?'

'Just so; it is about the children—at least one of them—that I was thinking.'

'O yes; about dear Tony,' said Mrs Dalton, brightening up. 'I ought to have thanked you for your husband's kind intentions to him. His offer to send him to Eton was most generous, and has of course been gratefully accepted by us.'

'To Eton!' said Mrs Campden quickly.

'Yes. Was it not just like your husband's kindness? What! has he not told you? But that is like him too. He would conceal his generous acts, if it was possible, even from his wife herself.'

'Yes, Edith, it is all very like George, as you were saying,' observed her hostess gravely; 'he is impulsive and lavish enough, goodness knows—Pray, don't imagine,' added she, as she saw the colour rush into her companion's face, 'that I could grudge anything my husband did for you and yours. He should send Tony to Eton, by all means—if it would benefit the boy; but consider—with his altered prospects—how unsuitable such an arrangement would be. I for my part should consider it a positive cruelty. The poor boy would only imbibe a taste for luxury that could never be gratified, and make acquaintances from whom circumstances must always separate him in after-life.'

'There is much, of course, to be said on that side of the question,' returned Mrs Dalton coldly (the word 'lavish' had wounded her to the quick, and if she had followed her own impulses, she would have declined all offers for Tony's benefit upon the spot); 'but on the other hand, John has many friends who have sons at Eton, and he thinks it would be well, if he himself must needs drop out of the sphere in which he has always moved, that the connection should be maintained through Tony, for the boy's sake. Fortune may smile upon us, even now'—

'My dear Edith,' interrupted Mrs Campden, 'most earnestly do I hope it will. But let us not be the victims of illusion; an expensive and fashionable school like Eton unless, indeed, the lad is to be a collegier; of course, if it is proposed to place him on the foundation, that is quite another matter.'

'I understand it was Mr Campden's intention, Julia, to place him in the same position as that he would have occupied if this misfortune had not befallen us.' Mrs Dalton's tone was calm, but her heart was failing; she had no false pride; but she well knew that the life on which poor Tony had set his heart—which it was such an inexpressible comfort to have heard that Uncle George's kindness had secured for him—was not such as is passed by boys on the foundation; the letters he had had from his young friends at that seat of learning had enlightened her upon that point; above all, he was delicate, and there were hardships to be endured by 'collegers,' to which 'opidians' were not exposed. It was foolish of her, of

course, to entertain such a predilection, but it must be remembered that she was a woman and a mother.

'Then, I must confess, Edith, I think my husband's offer has been very injudicious,' observed Mrs Campden confidently. She was thoroughly aware of her companion's reasons—if they could be called so—for her opinion, and would have entertained it herself, had their places been reversed; so that she was able to rebut her arguments without their having been stated—a great advantage in all discussions. 'I have always heard,' continued she, 'that collegers are just as well born and as well bred as others, only their parents have but moderate means. Surely, my dear Edith, it will be among these that Anthony' (the idea of shortening names 'for love and euphony' was repugnant to Mrs Campden) 'will find his more suitable place; and though, doubtless, an opidian's life is the more luxurious, is it judicious to allow a poor boy to be petted and pampered for a year or two, who will afterwards have to make his own way in the world and rough it?'

The mistress of Riverside had always confidence in her own view of affairs, but it was not always, as in this case, that the strength of the argument did really lie upon her side. Her opponent, too, was secretly conscious that it did so; perhaps the strongest motive she had had for accepting Mr Campden's offer on behalf of Tony was that, for the present, one member of her family at least should have no cause to drink of the cup of bitterness that must needs be the portion of all the rest. Why should the smile be banished from the face of her beautiful boy, since it could be kept there, perhaps, till smiles returned to all of them?

'I am sure you perceive the reasonableness of what I have pointed out,' continued Mrs Campden, clasping her hands in triumphant superiority, and regarding her victim, with head aside, like a magpie who has just picked another bird's eye out.

'Perhaps we had better leave the question of the boy's schooling to our husbands,' sighed Mrs Dalton; 'I think men know more about such matters than we do.'

Mrs Campden smiled a scornful smile. She had always despised her companion for having neither a proper spirit nor a will of her own; but this open acknowledgment of inferiority to the opposite sex was in her eyes something worse than contemptible.

'Well, well, my dear, we will discuss this matter another time. To benefit your boy will be only one of our pleasures as respects you and yours. I hope I shall be able to do something, and much more than this, for another.'

Mrs Dalton looked up quickly with inquiring eyes. There had been an unmistakable significance in the tone of her hostess. It was clear that she had some particular benefit in her mind, or a benefit to some particular person. Her face was indicative of a certain sense of her own sagacity, which announced a plan fixed and approved, and her eager eyes evinced her desire to communicate it.

Yet, so far from giving her any encouragement, Mrs Dalton replied, a little hurriedly: 'You are very good, I'm sure, Julia. I have promised to see Dr Curzon again before he goes about the Nook; so perhaps you will excuse me for a few moments; and without further apology, she quitted the room.'

'I think she guessed what I was going to say,' mused Mrs Campden grimly, when she found herself alone. 'I am afraid she has a weak nature to thus shrink from a subject simply because it is disagreeable. It must, however, be discussed sooner or later; and at all events, I have put a spoke in the wheel of that young gentleman's being sent to Eton at our expense. I never heard of such unprincipled folly. It could not be done under a hundred and fifty pounds a year at the very least; but when people get poor, they immediately begin to think that all their friends are made of money.'

GREAT GUNS AND ARMOUR-PLATING.

THE 'wooden walls' of Old England are declared to be wholly useless for naval attack or defence. Nothing will now do but vessels coated with thick iron plates, and carrying guns of enormous dimensions. Very good; but here comes the dilemma. Some other nations are just as able and disposed to adopt these ponderous and costly novelties as England. And, in point of fact, there is now going on an extraordinary rivalry as to who shall have the thickest armour-plated war-vessels and the biggest engines of destruction. It is altogether a queer struggle, dating from about the time of the Crimean War, when guns of large size began to be experimentally made, before there were suitably strong ships ready to receive them. Nasmyth's big gun was the talk of its time; Horsfall's gun was looked upon as a marvel, because it could fire a ball of two hundred and eighty pounds through four and a quarter inches of iron; and Clay's gun triumphed with a three-hundred-pound shot. Then came the beautiful inventions of Sir William Armstrong and Sir Joseph Whitworth, carrying the art of gun-construction to a degree of perfection never before attained. Next occurred the American Civil War, which startled our Admiralty by showing that no ship whatever, unless thickly jacketed with plates of iron, could resist the shots fired by the *Monitor* class of vessels. Therefore, we rushed into two expensive adventures at once—building *Monitors* armed with a small number of very heavy guns; and clothing a large number of our ships, some timber-built and some iron-built, with armour-plates. As, happily, we have not had to fight any great naval battle for twenty years, we could not try our big guns against an enemy's ships; and, therefore, targets were built up for the shot to bang away upon. Meanwhile, the navy yards were required to construct ships of war that would carry the largest guns mechanical skill could produce, and the thickest armour-plates that Sheffield could send forth. So matters have gone on year after year; ships, guns, shot, and armour-plates aiding in the struggle to determine whether the attacking power can be made greater than the defensive, or the defensive greater than the attacking.

Loud was the jubilation when, after the construction of several half-clad ships of the *Warrior* class, the Admiralty set afloat three fully plated iron-clads of the *Minotaur* class, with the enormous length of four hundred feet. It was fondly believed that no fighting-ships in the world would ever excel these. Experience shewed, however, that such very long ships are not handy for steering

and turning; and the Admiralty adopted a shorter standard for the *Hercules* and *Bellerophon*. Then came Captain Cowper Coles's revolving turrets in which to place the guns, instead of ranging them broadside. Then the announcement by Sheffield firms that, by rolling instead of hammering, they could produce armour-plates tougher and thicker than any before known. Then the completion of magnificent arrangements at Woolwich whereby the Fraser guns (a modification of the Armstrongs) could be made of vast size and enormous strength, on account of being wholly wrought, not cast. The 'Woolwich Infant' has become a favourite epithet for the monster gun of the present day; and a most extraordinary sight was presented to the 'zar of Russia, when he visited our great arsenal in 1874, in the 'Infant School,' where were ranged a selection from all the great modern guns that Woolwich could shew.

And so matters went on stage by stage—ships, armour, guns, and shot becoming alike larger and more powerful—until the momentous days of the *Devastation* arrived. Men really did think that at length we had arrived at such a pitch of destructive and defensive force combined, that further progress would hardly be sought. We shall see presently how far this supposition was correct; meanwhile it may be well to give some account of the points of difference between this famous iron-clad and those that preceded it.

Towards the close of 1869, the First Lord of the Admiralty, with all the pomp that usually distinguishes such a ceremony, laid the first keel-piece of the *Devastation* at Portsmouth. The theory of very long iron-clads had gone so much out of favour, that the length of the *Devastation* was settled at two hundred and eighty-five feet—more than a hundred feet shorter than some of its predecessors; the breadth sixty-two feet, rather more than one-fifth of the length. Its displacement—that is, the weight of the water which it displaces—exceeds nine thousand tons; and the steam-engines are capable of working up to six thousand horse-power. An ugly affair it is, without any masts proper, having a mass of ironwork on deck which would have puzzled Nelson or Howe beyond measure. This ironwork marks the strange changes which have been made in the arrangement of the armament of such vessels. The earlier iron-clads were broadsides, with a horizontal row of big guns peeping out on each side. Then came the revolving turret on a flat ship rising but a very little way above the surface of the water—a 'cheese-box on a raft,' as some one called it, with two enormous guns mounted in the 'cheese-box.' After various modifications and combinations of the broadside and the turret, Mr Reel, the Chief Constructor for the navy, introduced something new in the *Devastation*. There is a kind of armoured wall inclosing a space in the middle of the upper deck; the space occupies nearly three-fourths of the length, and one-half the breadth of the entire area of the deck, and the iron wall around it is seven or eight feet high. Within this space are two turrets or circular towers, and various structures and gangways connected with the navigation of the ship and the accommodation of the officers and crew. Each turret rotates, not on a central spindle, but on numerous rollers which work on the deck; and each, thirty feet in diameter,

contains two 'Woolwich Infants' of formidable character. No wonder that the entire mass has been compared to 'a raft with a heavy deck-load in the centre.' Upwards of twenty steam-engines are provided for working the ship in various ways.

We have said little yet about its armour and armament. When the *Devastation* had been a few months in hand, the nation was distressed by the loss of the costly turret-ship *Captain*, with all hands—including Captain Coles himself; and the Admiralty caused a thorough investigation to be made into the probable merits of the different classes of iron-clad. The result was favourable to the *Devastation*; but certain changes of plan were deemed desirable. When laid down, it was believed that the armour would resist the shot of a twenty-five-ton gun, the largest at that time ventured on in any navy; but improved gun-powder, in cubes, called 'pebble-powder,' had so increased the velocity and force of the shot as to render greater resisting power necessary, and so the *Devastation* was clothed with armour no less than twelve inches in thickness, carried down five feet below the water-line; the turrets have armour averaging thirteen inches thick; while the wall or breast-work around the inclosed space on deck is also formed of armour-plates. Compare this with the five-inch armour of the once-mighty *Warrior* and *Minotaur*, and we see what a stride has been made; no wonder that such a ship displaces nine thousand tons of water! Two guns of thirty-five tons were planned for each turret; but by introducing hydraulic gear for moving the turrets and their contents, thirty-eight-ton guns have been introduced—the heaviest adopted down to the time at which we are writing, with a twelve-inch bore, carrying a seven-hundred-pound shot. The *Thunderer* and the *Devastation* are sister-ships (if such savage monsters deserve to be called by so gentle a name as sister); and with alterations gradually made, they are approaching the maximum of twelve-inch armour at the sides, fourteen-inch armour around the turrets, carrying two guns in each turret, the guns thirty-eight tons weight, twelve and a half inches calibre, firing shot of eight hundred pounds.

And now, what do we hear? Woolwich pooh-poohs her own thirty-eight-ton 'Infants,' and is bringing others into existence more than double the weight—namely, eighty-one tons—a hundred and eighty thousand pounds of iron and steel in each gun! If told that these will cost five thousand pounds per gun, need we marvel?

When anything goes wrong in life, we are prone to ask who's to blame; and when told that the thirty-eight-ton gun is now looked down upon, a similar question suggests itself to the sorely perplexed tax-payer who has to provide the money for all these luxuries. The truth appears to be, that armour-plate makers can now go very far beyond the twelve inches of thickness that was lately their maximum; and that unless armour is eventually to defeat guns and shot, the Woolwich Infants must be more Brobdingnagian than ever. And so we come to the *Inflexible*, destined to be released into the water by the fair hands of a princess. This mighty ship will be double-screw, double-turret, with a load displacement exceeding eleven thousand tons. The length between the perpendiculars, three hundred and twenty feet, and breadth seventy-five feet (almost

equal to one-fourth of the length). Each turret will carry two guns of eighty-one tons, twenty-seven feet long, and sixteen inches bore, firing a shot of twelve hundred and fifty pounds! Those in the secret assert that such a shot, coming from such a gun, and fired with the improved gun-powder now manufactured, will have an impact or momentum equal to the whole ramming force of the *Iron Duke* that ran down the luckless *Vanguard*. The steel tube that forms the innermost part of each gun excels in size every single piece until now made, being twenty-five feet long, and twenty-five inches external diameter. When coil upon coil of tough iron have been wound round the middle and breech of this steel tube, the exterior diameter will vary from twenty-five inches to six feet. The government pay Messrs Firth of Sheffield sixteen hundred pounds for the solid mass of steel to make one inner tube, the boring-out being done at Woolwich. It was last September that the first of these huge guns was tried in the marshes at Woolwich; how long a time must elapse before all four will be ready to be mounted in the *Inflexible*, the future must shew.

When we are told that the original estimate for the hull and engines of the *Inflexible* was five hundred and twenty thousand pounds, and that the armament and fittings are not included; and when we bear in mind that the actual outlay always exceeds the estimates in these matters—we may guess, if we can, how far this ship will go to affect the pockets of John Bull.

Have we even now come to the end of this costly contest between the attacking and the defensive power of ships of war, this rivalry between guns and armour-plates? Engineers and naval constructors do not believe in any such finality. Their fertile brains are teeming with new schemes—more especially on the part of the makers of great guns, who manifest an increased confidence that they can more than keep pace with any increase in the thickness of armour-plates. Russia has established a naval arsenal at Nicolaieff, near the mouth of one of the rivers flowing into the Black Sea, where iron-clads of the largest dimensions can be constructed; and she has also provided herself with a factory in which great guns and ponderous armour-plates can be fabricated. Indeed, we owe to Russia (for good or for bad) the incentive to the planning of the eighty-one-ton gun. The *Peter the Great* (an appropriate name for the Czar's mightiest ship) has been planned to carry twenty-inch armour, at a time when a shot from our thirty-five-ton guns could only penetrate a fourteen-inch plate. What was to be done? Woolwich was consulted, and replied that a gun of something like eighty tons weight would be required to carry a shot which would pierce twenty inches of armour. There was no existing furnace that would heat, no existing steam-hammers that would forge the masses of iron necessary for such a mighty gun. New furnaces and new hammers were thereupon set up at a cost which we are afraid to mention; the guns are being made, and perchance—who knows!—may one day try their strength against the iron sides of *Peter the Great*. Russia has already a vessel carrying guns exceeding our *Devastation* and *Thunderer* guns—namely, the *Admiral Popoff*, the strange circular ship, with six keels, eighteen-inch armour, and two guns of forty-two tons each.

Sir W. G. Armstrong is trying his skill on a seventeen-inch gun that will carry a two-thousand-pound shot. Mr Fraser at Woolwich has broached the idea of a one-hundred-and-sixty-ton gun, to carry a shot of two thousand two hundred and forty pounds, with such velocity as to smash in the side of any ordinary iron-clad even at a mile distant; while Sir Joseph Whitworth, using an hexagonal bore of compressed steel, and a flat-headed elongated shot, entertains a firm belief that a gun on his construction, far less weighty than eighty-one tons, would vanquish an armour-plate even twenty-four inches in thickness.

Since writing the above, we learn that M. Krupp, the famous gun-manufacturer of Essen, has actually commenced making a monster of one hundred and sixty tons—an 'infant' double the size of those designed for the *Inflexible*. It is as well, however, to add, that no ship large enough to accommodate this piece of colossal ordnance has been as yet designed.

AN ADVENTURE ON THE CLYDE.

IN TWO CHAPTERS.—CHAPTER I.

THERE is no luxury the Glasgow citizen values more highly than that of having a summer residence at the 'coast.' He can attend to business all day in the hot dusty city, and in one hour can be transported from the smoke of its factories, the clang of its hammers, the hurrying crowds of its busy streets, to where the dirty, narrow river has widened into a broad, beautiful estuary, whose shores are studded with many a pretty town and village and splendid mansion. There he can breathe the fresh invigorating sea-breeze, and watch it filling the sails of fairy-like yachts, and blowing about the smoke from the funnels of the steamers which sweep along, leaving long tracks of white foam on the clear blue water. He can watch the splendour of the western sunsets, when the outlines of the rugged and picturesque mountains are thrown out clear and sharp against the opal-tinted sky; when the floods of rosy light reflected from the sea, seem to fill the air with a luminous haze.

As a rule, the city man is not poetical, and perhaps is deep in the 'money article' as the setting sun sheds its glory over him; but he fully appreciates the change from the hot dusty city, and enjoys the fresh air and the laughter of his children, who, relieved from the social pressure of town-life, which is as hard on the bairns as their elders, paddle barefooted among the wavelets and the sand. So he locks up his town-house, puts brown paper in all its windows, and shaking the dust of the city from his feet every afternoon, joins his family at the seaside.

My brother and myself, being old Glasgow folks, of course conform to the usual custom; but in choosing our summer residence, we select a quiet in preference to a fashionable place, and for this reason Lunellan was one of our favourites. It is a good deal changed now; and the staring plate-glass villas have increased and multiplied so that I hardly recognise the old place; but ten or fifteen years ago, its whole trade was represented by one or two shops of the omnium-gatherum sort. Its pretty white houses looked so bright and pleasant in the midst of their flower-gardens, gay with roses, tree-fuchsias and rhododendrons, with the dark background of trees, and the rugged heath-clad

hills stretching away up behind. We used to enjoy the Sundays there so much. The female element predominated rather largely during the week. Groups of bright young girls might be seen rowing about on the water, or seated on some rocky perch with novel or fancy-work; mammas sitting watching the children at play; and old maids like myself wandering about, talking of nothing in particular.

The sterner sex is, now as then, only represented by a few boys or retired old gentlemen, till the half-past five boat from Wemyss Bay brings the city men back from business. To watch the return of that boat is the great event of the day; to go to the pier to meet it, and get the gentlemen to put away their newspapers and talk, is the only excitement. But on Sunday, no early steamer sweeps up from Rothesay, warning the dilatory gentleman, by the dash of her paddles, to bolt his roll, swallow his coffee, and rush to the pier, to be carried back to the worry and toil of business. The great world, with all its cares and anxieties, is quite shut out. No railway has ever penetrated these hills behind us, no stage-coach crawls up their sides; no Sunday steamer is allowed to approach the pier; so that neither letters, telegrams, Sunday visitors, nor half-tipsy excursionists, can come across the bright waters to annoy us. We have the gentlemen all to ourselves, which of course makes a great difference. But I think the most anxious day I ever remember to have spent in my life was one Sunday at Lunellan nine or ten years ago.

At that time, we (that is, my brother, his only son Tom, and myself) found ourselves located in a semi-detached villa. It had two doors in the middle, within a foot of each other, and a mutual scraper stood between. There was an oriel window on either side the doors, and a flower-garden in front, divided by a joint-stock gravel-walk; and each detachment had a mutual interest in the green, with the clothes poles behind, where croquet was sometimes played, when people could be got to overlook such little inconveniences as ill-kept grass and ground rather on the in-line. We took possession of our share of this desirable sea-side residence on the first of June; but several days passed before the other half was occupied. I began to feel a great curiosity about our future neighbours—a curiosity I made so manifest, by indulging in certain wonderments and speculations concerning them, that I laid myself open to a good deal of teasing from my nephew Tom (who, by the way, has a wonderful talent for teasing), and his first salutation, on his return from the city every evening, was: 'Well, auntie, any news of the semi-detachments?'—'What a meddling old maid you are!' he would sometimes say. 'I really believe your only reason for taking this house was that these oriel windows afford such excellent opportunities of prying into the affairs of your neighbours.'

To tell the truth, the provoking fellow was not far wrong. Though I have the very great privilege of looking after the dinners and shirt-buttons of my brother and nephew, I would have many a lonely hour, were it not that I take an interest, a kindly interest, in my neighbours. I don't care to know what they have for dinner, or what are the most glaring iniquities of their servants. I am by no means a meddling old maid; and Tom, who likes to have a monopoly of all the saucy

things said to me, would seriously resent the epithet being applied to me by any one else; but I do like to be taken into people's confidence, and to have my advice asked; and the thought did cross my mind in taking the semi-detachment—as Tom called it, though its name is Rose Villa—that it would be very nice to get friendly with the people next door. I knew nothing about them except that they were a Mr and Mrs Nisbet, from Glasgow. The landlady had told me so much when I took the house. But having very little else to think about, I thought a good deal about them, and always looked at their windows, the first thing when I returned from my walks, till the arrival of the people next door became an event of great importance in my eyes.

At last one evening, nearly a week after we came down, just as I was sitting down to a solitary cup of tea, the gate opened, and a tall, pleasant-looking gentleman entered, with a pretty, dark-eyed, rather delicate-looking young lady on his arm. 'Ah,' thought I, with a sense of disappointment, 'they are newly married people, and won't want to say anything to me. But no; here comes a girl carrying a baby, and another servant with a lot of rugs and shawls, and a porter with a barrow-load of luggage.' I was so delighted, I had almost rushed out to welcome them; but reflecting that such a proceeding must necessarily seem a little absurd, I contented myself with rubbing my hands and watching what was going on, standing back a little, that they might not see me. They looked so nice, and the baby too. Nothing could have been better. 'She will be sure to want to know what is the matter with it when it cries, and will ask my advice on hundreds of points concerning it, when she knows I have brought up such a fine young fellow as Tom.' I felt quite excited, and could not settle to take tea; a happy thought struck me. The poor young mamma looked pale and tired; perhaps I had better ask her and the baby in, and give her a cup of tea, till they get the boxes unboxed and things put straight. I did not give myself time for a second thought, but passed immediately from my own door into theirs, which stood open. The hall was full of boxes; and the lady was sitting on an easy-chair in the dining-room, wearily taking off the baby's wraps; while the husband, who had just taken off his hat and overcoat, stood wondering what he should do next. The two servant-girls were on a voyage of discovery in the back settlements, under the guidance of the woman in charge, whose voluble explanations were quite audible where I stood. I advanced a step, and said (a little timidly), for I did not know what they might think of my intrusion: 'I beg your pardon for my unceremonious entrance; but my tea is just on the table, and I thought the lady looked tired, and might be the better of a cup.'

They both looked a little surprised, as well they might, at this incoherent invitation to tea. The lady smiled, and said: 'You are very kind, I am sure!' and then looked at her husband, as if asking his opinion.

'You must think me a very strange person,' I went on hurriedly, 'to come down on you in this abrupt fashion; but I live next door. You may perhaps know my brother—Mr Mackinlay of St Vincent Street.'

'O yes,' said Mr Nisbet, interrupting me; 'I have met him on business several times. I am

delighted to make your acquaintance.' And turning to his wife, he introduced her, and told her she had better accept my kind offer.

In a very few minutes, she was sitting by my cosy dining-room fire; for it was often cold on these June evenings, and I liked the cheery blink of a fire. She was a little shy or stiff at first, and kept apologising, and wanting to relieve me of the baby; but I would not hear of it till she had taken a cup of tea. 'Indeed, you will make me feel very uncomfortable if you say any more about it. I certainly took a great liberty with you,' said I.

'Oh, don't say that,' she answered. 'You are excessively kind; but I see you will not believe I think so, unless I take the fullest advantage of it,' she continued, taking the cup in her hand with a bright smile; not the little conventional one she had favoured me with before, but a smile that lighted up her whole face.

We soon began to get quite friendly over the tea; and then there was the baby to praise, and of course I let her know how I had brought up Tom from babyhood, and was a person of some experience in the ways of babies; and so the time passed very pleasantly till she rose to go. 'I have felt so much refreshed with the tea,' she said. 'I was just sitting wishing I had a cup, when you popped in, offering it me, like a fairy in the story-books.'

'Yes,' I said, laughing, 'it was quite according to precedent that the fairy of the teapot should appear in the shape of a little old woman.'

Of course I told the whole story of the arrival to Tom and his father when they came home, including my rôle of good fairy; and Tom drew a caricature of me with a pair of wings at my back, huge spectacles on my nose, and a teapot in one hand, and a big scone in the other.

By-and-by we saw Mr Nisbet walking in the garden, smoking.

'Hollo! it is that young fellow Nisbet they have lately taken in at Ferguson and Frost the tweed-merchants in our street,' cried Tom.

'So it is,' said my brother. 'He bears a high character as a business man, and a nice young fellow into the bargain.'

'Come then, father,' said Tom, 'and let us be civil to him. We ought to let him know that the good fairy of the teapot is related to a most respectable Glasgow merchant, and has a nephew who will smoke as many pipes as he likes with him.'

I was not disappointed in my expectations with regard to Mrs Nisbet. She appeared to be as glad of my society as I was of hers. She knew no one in Inverleith, and very few in Glasgow; for Mr Nisbet had been so long in London, that he had few acquaintances except business ones; and Mrs Nisbet had never been in Scotland till her marriage, about a year before. I believe she would have been very lonely when Mr Nisbet was at business, but for me, and then she had always something concerning baby to consult me about; so that we soon became great friends. She was very gay and lively too; and I used often to be amused at the way in which she would turn Tom's somewhat clumsy banter against himself, much to that young gentleman's benefit and discomfiture; for, with the absence of formality which marks one's social intercourse at the sea-side, in the course of a few days

we all got to be very friendly with each other; and not only did Mrs Nisbet and I spend our mornings together, but the evenings also were spent in each other's society, along with the gentlemen; and many a pleasant crack we had over the nightly glass of toddy. Every one has had experience of these mushroom friendships—pleasant while they last, but forgotten almost as soon as formed, as this too might have been, had it not been for an adventure, which drew out our sympathies, and turned our holiday intercourse into a strong and lasting friendship.

When we had been at Tunellan about three weeks or so, Mrs Nisbet told me one morning that the next Sunday was the anniversary of her marriage, and she wanted to prepare a little surprise in the shape of a dinner, which she meant to lay out like a wedding dinner. She had brought her wedding-dress, and was going to wear it, and hoped we would not think it wrong to come and dine with them.

'It is a pity it falls on a Sunday,' she said; 'but I can't help it, you know; I was married on a Friday; and as this is leap-year, that makes the anniversary on a Sunday. I remember people saying Friday was such an unlucky day to be married on; but it has not proved so with me. John and I have never had the slightest quarrel, nor has he ever vexed me in any way. I sometimes wonder if there are many people in the world as happy as I am. The only thing I have to wish for is, that my brother Charley knew him a little better, for I sometimes fear he does not like him.'

'What does he dislike him for?' I asked.

'Oh, I don't know; he never said anything against him, but I can see he thinks him frivolous, or something. They have not been much in each other's society; but he is to be here this week, and they will get better acquainted, I hope.'

She had been talking a great deal about this visit of her brother's, whom she had not seen since her marriage, he having been abroad.

'Yes, if Charley only knew John better, I should not have a single thing to wish for; my happiness would be perfect,' went on Mrs Nisbet.

'Hush!' I said, almost involuntarily. 'It always seems ominous to hear people talk of perfect happiness.' But noticing her scared look, I hastened to reassure her, and bade her not mind an old woman's nonsense, but to let me hear all her arrangements for Sunday. I heartily regretted my unfortunate slip of the tongue, for I saw it had troubled her. The cloud soon vanished from her face, however, as we talked about her brother and about next Sunday.

'I wonder if John will forget the day?' she said; 'it would be such fun, if he did! He would be so surprised, when he and Charley returned from church, to find me in white silk, and the dinner-table all decorated with white roses. If I find that he has forgotten the day, I shall compel him to go through the ceremony of marrying me over again.' And so the young wife chatted on, laying her innocent little plans with all the mystery of a conspiracy.

Mr Methven, Mrs Nisbet's brother, duly arrived on the Friday afternoon, and was as duly brought in to be introduced. He looked several years older than his sister, whom he rather resembled. He

had not such a frank expression as his brother-in-law. If Mrs Nisbet had not mentioned it, perhaps I would not have noticed that there was a slight tone of contempt in his voice when he spoke to him. But we were all talking and laughing in our usual merry careless fashion, and Mr Methven's manner was not much observed. I thought he might well have trusted John Nisbet's clear honest eyes, and his voice, that had the ring of truth in it, if ever a man's voice had. I am rather given to jump at conclusions, but my brother knows that my instincts are seldom at fault. We parted, laughing and talking as usual, on the door-step. But these two men knew each other better when we were destined to meet again.

Next day was Saturday; and the Nisbets had arranged to take a trip round the Kyles of Bute in the *Iona* (prince of steamers), and we were to spend the day at Kilm. As we started rather early, driving—for there was a picnic we were expected to join—we did not see any of our neighbours before we left. It was getting late when we returned—between ten and eleven o'clock. The wind had risen, and a nasty wetting rain was blown in our faces; and we could now and then see a great shower of white spray dashed up as the waves thundered on the rocks. We were very glad, when we drove up to the gate, to see the cheerful light from our dining-room fire glancing on the wet gravel and the dark leaves of the evergreens. I noticed a white figure at Mrs Nisbet's drawing-room window, which we supposed was her, and waved a good-night; but she did not open the window or speak. We sat for about half-an-hour or so, as my brother made his usual tumbler of toddy, and then we separated, and went to bed.

After I had gone to my room, I could not help recalling Mrs Nisbet's solitary figure at the window, and wondering how she came to be sitting there alone. Just then, a timid little ring at the door-bell startled me; and hastily throwing on a dressing-gown, I ran down-stairs with the candle in my hand; and opening the door, I found Mrs Nisbet on the step looking as pale as death, and trembling all over.

'Why, what is the matter?' said I, drawing her into the dining-room, where the fire still sent a ruddy glow over the carpet.

'O Miss Mackinlay, John and Charley have never returned! You hear how stormy it is; I fear they are drowned.' And she threw herself on a chair, and covering her face with her hands, burst out sobbing as if her heart would break.

I tried all I could to soothe her; but I could not in the least understand what had happened; and she was too agitated to speak.

Presently, my brother William came down: he had heard the ring and the door opened, and he had risen to see what was the matter.

'My dear Mrs Nisbet,' said he, 'I am sorry to see you in such distress. What has happened? Can we help you in any way?'

'She fears that Mr Nisbet and Mr Methven are drowned,' I said; for Mrs Nisbet was struggling to compose herself, and could not speak yet.

'Drowned! How? Did you not go in the *Iona*, as you intended?'

'O yes,' she answered; 'we went; and got home all right about four o'clock; but this was later, when I went to put baby to bed. They thought

they would take the small boat, and go out for an hour's fishing. I said: Did they not think it a little stormy? But they said it was nothing, and they would not stay long. So I went off with baby, who was very restless, and cried a good deal; and I could not get him to sleep till after nine; and when I came down-stairs, I was surprised to find they had not returned, particularly as it was getting dark and had begun to rain. I put a shawl over my head, and ran down to the beach, to try if I could see anything of them; but there was no sign of their having returned. The boat had not been brought back, and there was nothing visible on the water; but it was getting so dark we could not see any distance. The old man we hire the boat from said it was a nasty night to be out in them wee boats; but no one could give me any information; and I have sat watching at the drawing-room window ever since. Do you think they will ever return?' she faltered, looking at us so piteously with her large dark eyes full of tears.

'Why, yes; they will be sure to return. You have sat alone till you have made yourself nervous. There really is no reason why you should distress yourself so much,' said my brother. 'Why did you not call to us as we came in?'

'Till then,' she said, 'I expected them in every minute, and I thought it a pity to trouble you; and then, as I watched the light from your cheerful room streaming out on the darkness, I could fancy I saw you all sitting round the fire chatting and laughing, and Mr Mackinlay mixing his toddy; while the wind shook the window against which I was leaning, and howled and shrieked among trees and round the house, and I could hear the angry dash of the waves on the beach. Suddenly the thought came into my mind with all the force of a conviction, that they never would come back again, and that I would sit listening for their footsteps in darkness and sorrow, watching the light from other people's happiness, which never would shine on my life again.' Her voice sank into a low mournful wail as she finished speaking, and she leant her head and her folded arms on the table, and gave way to a fit of sobbing.

My brother and I looked at each other: we had neither of us fancied there was such depth of feeling and imagination hidden in her usually merry heart; and a line from a poem I had been reading came into my mind:

Ah, friend, I fear the lightest heart
Makes sometimes heaviest mourning.

'Come, come, Mrs Nisbet,' said my brother, 'you really must not give way like this. Think how vexed Mr Nisbet and your brother will be when they return (and they may now be on their way) to find you distressing yourself so. You will find that they will return all right. I have often heard of boats being unable to make to the shore when the sea was running high, and the tide against them; but they generally manage to run in somewhere, and get back all right.'

'But sometimes they never come back at all,' said Mrs Nisbet, with a hopeless, despairing look, that went to both our hearts.

'Sometimes not,' said my brother gravely; 'but very, very rarely. Why should you persist in looking at the darkest side? I assure you I would not bid you hope, if there were no grounds for it. I am quite sure we shall have them back to-

morrow, if not to-night, relating their adventures in the best of spirits; and I am certain their greatest trouble, at this moment, is thinking of the distress a certain lady, dear to them both, may be suffering on their account.'

A feeble little smile, like a wintry sunbeam, played for a moment on her face at these words.

'That is right,' I said. 'You must try to keep up. I am sure William is right; and I can assure you, my dear, he is not the man to delude you with false hopes. You have let your nerves get the better of you, with sitting so long alone; and the wind and the waves together appear to have played very unkindly with you, putting all sorts of dismal fancies into your head. If you had only come in, instead of sitting brooding all by yourself, your convictions would have taken a more hopeful aspect; but you see what comes of a want of neighbourliness. And now, if you will excuse me till I go up-stairs for some clothes, I will go in and stay with you, and see if we can't find a less dismal version of "What are the wild waves saying?"'

PAINTERS' PLEASURES.

EVERY toil has, more or less, its attendant pleasures. The writer weaving his story, essay, or history, would not care to exchange his occupation for any other, far less for a state of 'shapeless idleness,' any more than would the sculptor, giving to inanimate clay the semblance of palpitating life. Still less, we fancy, would the painter exchange for any other toil that with which, as with a magician's wand, he conjures up with his brush upon the blank canvas, and brings into warm breathing existence, the creatures of his brain, or the loveliest images and forms with which the face of nature teems.

Whenever we go forth upon our country jaunts, it is seldom that we light upon a pleasanter incident than one of the brethren of the brush, seated before his easel in the open air. The sight of his white umbrella in a moment excites our interest and curiosity. May it not be, too, that there is a touch of envy mingled with these feelings, after a respectful visit to his encampment? Nearly all of us wish we could do likewise, and say so; shewing clearly that we look upon him as an essentially lucky fellow; and so he is. Truly, he, no less than other mortals, has a fair share of difficulties, disappointments, heart-burnings, and doubts, incidental to his business; physical disagreeables to undergo, and mental distresses to overcome; notably, the never-ceasing one of his efforts falling short of the standard of excellence he sets up for himself to attain to. But he has this one never-to-be-forgotten point of supremacy—he is sure to love his labour as himself. Unless he does, his handiwork will be of little worth, he is no true artist, and we are not considering him here.

Let us follow one of the right sort, then, through a few of the pleasant phases of his career. It is early spring, say; he hails the promise of genial weather with eager gladness, and is off upon the first opportunity to the yet leafless woods. The enthusiasm with which he opens his outdoor campaign is not one of the least interesting aspects which he presents. Watch him when he has settled down to a subject such as this, for instance: A

straggling mass of young oaks stretches across the middle distance; one or two ancient monarchs of the forest, gnarled, angular, and sturdy, nearer to him, are the leading features; whilst a broad, open glade of the park, terminating with a line of rook-nest dotted elms, backs up, together with the tender-toned sky, the myriad interlacings and network of the bare branches. Here, verily, is

A glimpse of spring, with flush of promise,
Falling on the fretwork of unnumbered boughs.

Primroses, bluebells, and violets in the foreground, assert themselves in bright specks of colour on every ridge and nook of the crumbling gravelly bank, and amid withered grasses, dead ferns, and rotten russet leaves. Fresh shoots of emerald grass and purple browny buds all about, give hope and promise, unfelt in autumn, to the scene. And it is not unlikely that, through some gap or vista, is to be had a distant peep of gable, roof, ivy-covered turret, quaint chimney, and a wreath of blue smoke, telling, as it curls upwards amidst the surrounding woods, of home and comfort. In such a spot as this he pitches his tent or umbrella for a longer or a shorter time, according as sketch, study, or finished picture is his purpose.

The gradual growth of the one or the other, however, so absorbs him that time becomes as nought, and all he thinks of, beyond what he is doing, is the pleasantness of the place, or the trivial little incidents that occur, perhaps, as the dappled deer, unconscious, till they are close upon him, of his peaceful presence, start off pell-mell down a drive; or the rabbits, towards evening, come out to feed, and lend a feature to the foreground, of which he takes advantage; or the gamekeeper's children come to pick up the crackling, fallen twigs, or the interest provoked by the doings of a pair of squirrels high aloft. Of the pleasant sounds, too, he will not be unconscious. The whole region is alive with melody: blackbird, thrush, and the rest of the airy choristers are giving vent to a joy that can but little exceed his, at the return of sketching weather. The varying tints from morn to mid-day and evening take up all his attention, and set him thinking how he may best utilise them. The pipe here, no doubt, will be called in as an aid at intervals, and after the mid-day snack. An indispensable agent in your artist's thoughtful moods is his pipe; and you must not think he is idling, if he frequently rises from his three-legged stool to refill and light that trusty and silent companion. It helps to solve some knotty point in the composition—for the settling *what* to do often takes longer than the doing, in the painter's craft; and a view of his canvas at different distances being essential, you are not to think him fidgety any more than idle because he is for ever up and down and to and fro.

A regular snuggery he makes of his little encampment; and the dodgy contrivances for convenience, strength, and portability, in the camp-stool, umbrella, folding-ensel, colour-box, palette, haversack, &c. are worth a glance. These, with modifications according to the system on which he works, accompany him wherever he goes; and whether, as now, the beginning of his outdoor season, or later on, when in a similar spot, the scene has been turned by summer into one of green luxuriance, an air of diligent, quiet content-

ment, very enviable, hangs about him and his belongings.

Transport him to the sea-shore, it is just the same. The ebbing tide leaves bare the big brown rocks with their fringe of bladder wrack, dripping and reflected here and there in the pools, whence rivulets trickle across the smooth or furrowed sands, in the wake of the great waters of which they are the straggling remnants; the curling fringe of surf at the marge melts into the emerald, and blue, and softer azure of the sky; the stranded fishing boats; the accidentals of fishing-life; figures, carts, and donkeys, basket-laden, toiling towards the little village nestling beneath: such things as these make up sufficient of what the landscape-painter lives upon, and is never so happy as when catching.

Again, above, upon the cliff-tops, amongst the barley and the wheat, with harvesting going on, can there be a pleasanter workshop, or work more enticing than that of putting to paper successful presentments of what then and there comes under the artist's eye? Look at that ridge of golden grain as it cuts against the glittering sunlit sea; sniff the refreshing, sweet-scented breeze, listen to the quiet yet joyous sounds of larks above, waves below, and rustling corn-sheaves in the front! Why, if the open air and nature's beauties are ever to be enjoyed, here is the opportunity; and yonder bearded, bronzed-faced, easy-clad toiler under the white umbrella, is the man to make the most of it.

Wherever his pursuit of nature leads him, by copse or cliff, in rural village, on the skirts of ancient towns, amidst abbey ruins, in secluded valleys, in the hay-field, or the hop-garden as the seasons progress; on the borders of lake or mountain tarn, by the side of lily and willow fringed stream, rushing torrent, wild moor, heathery fell, Alpine pass, vineyard, olive or cypress grove; or any of the multitude of spots affected by the brethren of the brush for camping-grounds, his work-a-day hours are much the same, each one of them bringing increase of cunning to his hand, and higher and wider knowledge of God's gifts to men.

Thus and much more for his time of pleasant toil; for what can be freer or so delightful? Inter-course with all sorts and conditions of men make the painter cosmopolitan. He is usually kindly natured, and willing to be at home with everybody. Whilst on his rambles, too, 'prospecting', and marking down likely localities, he meets with infinite matters of interest, fun, and character; his unusual presence and proceedings give rise to much originality in the remarks of the natives. There is no limit to the curiosity, suspicion, and even fear, which some of his proceedings create in neighbourhoods where he is a stranger. High and low alike doubt and wonder at him at first. Aged dames, children, and even grown men, have been known, when coming along a lonely path or high-road on which an artist has been 'negotiating' a subject, suddenly to stop, look wonderingly for a moment, turn back, and incontinently flee, as if scared by the presence of a wild man or an escaped lunatic. His squattings down and risings up, his dodgings to and fro, with hands held up on either side, or above or below the face, as he has endeavoured to frame in and settle the

visual field of the picture before him, have produced a consternation and a thrill of awe impossible to exaggerate. The poising of head right and left, with the frantic and abortive effort at times to look at a subject through his legs, upside down, the better to get a notion of the colour as separated from the form—these gymnastics, together with his bearded, be-wide-awaked, strange appearance, and the weird, incomprehensible paraphernalia which he carries, have many a time sent a wave of terror through a limited and primitive population.

Once settled, however, in his homely lodging or unpretentious inn (for he does not affect the grand hotel, even if one be within his reach), and he is discovered to be a harmless, amiable man; he soon makes friends, his work inspiring deep interest and wonder. Perchance he is working in some quiet English nook.

'Whitiver do he get paintin' for, under that theer old umbrella? What bees un at?' is a frequent question asked by one native of another.

'Why, don't ye know?' answers the second, probably the great authority of the village. 'He'll make a fine draft of it—he bees draftin' yon old ancient house, Missus Burke's. Bless your heart, they things sell for largish sums of money when "expedited" in Lunnun galleries and such-like. I've been talking to the gentleman, and he be "intimidated" his intention of so doin' when the draft be finished. Why, I shouldn't wonder if it wer'n't to be worth a matter of four or five pounds by the time he's done w' it.'

This leads occasionally to the assembling of an audience more admiring than convenient; but a little patience and good-nature will generally prevent its material interference with work; whilst of a certainty there will be dropped one or two observations worth remembering.

The loiterer of every degree (and what a lot of loiterers turn up when one begins to sketch, people to whom time seems of no value) is attracted, as the moth to the candle, by the white umbrella; the itinerant basket-maker or chair-mender, squatting under hedge or wall, being the only approximate rival. When his genial good-fellowship is thoroughly understood, and it is seen that the artist is not wholly ignorant of or uninterested in agricultural pursuits; that he has a knowledge of crops, pigs, poultry, cows, horses, and of farm-life generally; or understands craft and their rig, nets, fishing, and fish; can ply an oar, haul on to a rope, or manage the helm; that he is not bad company with his songs and jokes; and that he is at home in the cricket-field, or in most manly sports and pastimes—there is no more welcome or better-liked visitor to a neighbourhood. More often than not, on quitting it, he leaves, besides his good name, many a little memorial of his good-nature, in the shape of sketches of houses, places, and people, greatly treasured and shewn hereafter with laudable pride by those who have been fortunate enough to receive them.

Thus, socially as well as professionally, our artist has a pretty good time of it; and when the winter puts a stop to his work in the field, his life in the studio brings other pleasures. There, amidst quaint and heterogeneous decorations, from ancient armour and arms, to teapots and pipes—from antlers and stuffed birds, to harmonium or guitar—from charcoal caricatures, to completed oil-

pictures, rugs, tapestry, antique furniture, and the rest—he carries out and completes his summer's work: getting, as they gather round the stove in genial talk, the opinion and advice always generously proffered, of his brethren, on what he has to shew. Then come the preparations for exhibition, the mounting, the framing, &c.; followed finally by visits from those necessary individuals called buyers, with their indispensable cheques. A certain period of tribulation, it must be admitted, succeeds, through which all painters pass, or have passed—that period during which the fate of the picture is balanced by the council and hangers of the Exhibition.

But even if bitter disappointments have often to be faced in the winter, they are pretty well over and in a fair way to be forgotten—except as stimulants to renewed exertion—by the time the cuckoo has returned to her woodland haunts, and the season for outdoor work has returned.

CURIOUS PHASES IN NATURAL HISTORY.

APHIDES.

ALL who keep a garden or greenhouse must be familiar with those curious little green insects, the Aphides or Plant-lice. Existing in thousands on our flowers and shrubs, and feeding on the juices of the plants, they constitute veritable pests; and some species, infesting the bean, hop, and other cultivated plants, cause much anxiety to the agriculturist from their destructive effects on his crops. Both sexes of aphides are generally found in a wingless state; although, as will presently be explained, the individuals of one and the same species may possess wings at one period, and be wingless during the rest of the year.

A fact of primary interest in the habits of these insects consists in the attentions paid to them by the familiar ants—the famous Huber being the first who noted the discovery. Thus the ants may be observed to follow after the plant-lice, and to stroke the abdomens of the latter with their antennae or 'feelers,' the act causing the aphides to exude a sweet viscid secretion from two tubular pores placed towards the hinder extremity of their bodies. This, the ants greedily devour. Mr Darwin mentions an observation of his own which seems to strengthen the idea that the relations between the ants and their providers are of a very intimate and reciprocal kind. Having removed all the attendant ants from a group of about a dozen aphides which resided on a dock-plant, Mr Darwin prevented the ants from regaining their vantage-ground for several hours. Feeling certain that the aphides would by that time have secreted a goodly store of the sweet secretion of which the ants are so fond, Mr Darwin watched them intently for some time, but did not observe a single aphid emit the secretion. He then tried to imitate the movements of the ants' antennae by stroking the abdomens of the plant-lice with a hair; not a single aphid, however, responding to the imitative demand. A single ant being admitted to the guarded aphides, it was observed to hurry from one to the other, as if aware of the plentiful store of sweets awaiting its attention; and when this single marauder, if we may so term it, began to stroke the various aphides with its antennae, the latter rapidly excreted the coveted fluid, which was greedily absorbed by the ant. Very young plant-lice similarly respond to

the call of their insect-brethren; and this latter fact would tend to shew the purely instinctive and hereditary nature of the curious impulse on the part of the aphides; whilst the action of the ants in the matter must be no less of instinctive kind.

But exceeding in interest even the curious habits just noted, we find the *development* of the aphides to present us with some phases of puzzling and inexplicable aspect. At the close of autumn, male and female aphides are found herding indiscriminately together. The eggs produced by them, after lying dormant throughout the winter season, burst into active life in the succeeding spring, and give birth, not to males and females, as might be expected, but to wingless six-legged aphides, which, if their sex be determinable at all, must be that of the female.

Now appear some curious phenomena; for if these wingless females be watched, they may be seen to produce, alive, and not from eggs, brood after brood of young aphides, exactly resembling themselves, in that they wholly consist of female insects, and like their parents, are destitute of wings. Throughout the spring, summer, and autumn, each successive generation of these wingless females thus produces progeny which repeat the features of their spinster-like parents; not a single individual of the 'sterner' sex being found within the limits of this Amazonian population. And this uninterrupted succession of female generations may be repeated and traced in a single season, through nine, ten, or even eleven generations; whilst the number of the progeny of a single aphid-mother may amount, as estimated by Reaumur, to 5,904,900,000 at the fifth generation alone. At length, when the close of autumn once more comes round, and ten or eleven generations have been born, this uninterrupted succession of female progeny ceases, and gives place to a due proportion of winged males—as at the similar period of the preceding year, when our survey of their life was supposed to begin. Then, as before, eggs are produced by this last generation; and from these eggs, in the succeeding spring, will be developed the wingless females, whose descendants will repeat the strange history of the preceding year.

If we appeal to the zoological world for an explanation of these curious facts, we shall find that several conflicting theories and opposing views prevail. As all must admit, the circumstances above detailed, and as verified by repeated observation, leave no doubt on the mind that the ordinary laws of organic development are not only set aside, but are incompetent of themselves to aid us in obtaining a solution of the matter. Thus, it has been supposed that the reproductive influence of the original and ordinary development, through eggs, of the first brood of the male and female aphides, extends throughout the succeeding generations. This, however, is merely a theoretical possibility, and does not aid us in the explanation of the anomalous fact, that the *one* sex alone, is enabled to produce living progeny; whilst under ordinary circumstances, and throughout the whole range of the oviparous world, the co-operation of *both* sexes is necessary to develop eggs capable of evolving progeny. The case of the aphides would be paralleled in that of plants, if the seeds of plants furnished by the *pistils* could be duly fertilised or rendered capable of developing a new plant, without the influence of the necessary pollen-

substance furnished by the *stamens*. And this, so far as we know, is impossible.

Naturalists know these phenomena under the name of *parthenogenesis*; and probably the best explanation of the development of the aphides, together with allied cases in other insects, is that the eggs resemble 'buds' in their essential nature; and whilst ordinarily eggs require for their development the presence of both sexes, the generations of female aphides may be regarded as produced from their single parents, by a process of *internal budding*. The stock or structure in the females from which these egg-buds are produced may be named 'germ-stocks'—the *Keim-stöcke* of the German naturalists. And in this view, we might not inaptly compare the life-cycle of the aphides with that of a plant. The plant springs from the fertilised seed—as do the original aphides from true eggs. The plant further by budding produces through the greater part of the year its leaves and other organs—as the spinster-aphides produce their young by an analogous process. Then, in due season, the stamens and pistil, or reproductive organs of the plant, are formed, and the fertilised seeds capable of giving origin to a new plant are produced—just, indeed, as the aphides in their turn develop both sexes, and as from the eggs thus developed, new beings with special powers and tendencies are introduced into the wondrous cycle of their life. The consideration of such interesting phenomena as the preceding, should forcibly impress us, above all other considerations, with the marvellous plasticity of living forms, and with the endless variety of contrivance and action, which, for the accomplishment of its own duty arranged ends, life is continually exhibiting before us.

HOLY LOCH.

How fair the scene, as from this mound
Of cushioned heath we gaze around.
The verdant slopes with mingling shades,
The ravine's intersecting glades,
Part covered with the mountain flock,
Part ruins gray of fallen rock.

Or fix our gaze upon the strand,
Where wavelets kiss the golden sand;
Or view the silvery lake at rest,
Rough mountains mirrored on its breast.
The aspect breathing peace! until,
Round by the brow of yonder hill,
The kestrel wheels with hungry eye,
Wind hovering, his prey to spy:
The timorous lark far 'neath his wings
Close to the earth for safety clings
'Mid kindred hues, till sails away
To other range the bird of prey:
Then mark—the danger out of sight—
The laverock heavenward takes her flight,
And the response from hill and glen,
Rejoicing in her notes again.
Thus nature's ways will never cease
To link with strife the joys of peace! W. G.

CLUB-LIFE.

CLUBS are not a new institution in England. As associations of select individuals with kindred tastes, who met for social intercourse, they were known in the reign of Elizabeth. In time, they assumed a political character; but while this is still in several cases a distinguishing feature, clubs are now for the most part lounges for the sake of news and social recreation, along with such refreshments as used only at one time to be obtained in hotels or taverns.

Of the social clubs in London, White's stands at the head. 'White's Chocolate House,' where the great men of the days of Queen Anne and George I. met to drink a dish of chocolate, to eat a cutlet, to talk scandal, but chiefly of all to gamble, is now White's Club, the most select and aristocratic of all the purely social clubs. Here princes of the blood may sometimes be found writing letters of an afternoon; and the morning-room is seldom without its supply of noblemen of high rank. Somewhat dull, but very select and stately, White's still stands on the old site at the top of St James's Street, and is still the chosen resort of the fashion of the day. Even White's, however, is not what it once was. A young and vigorous rival has in recent years threatened to dispute its supremacy in the world of fashion. This is the Marlborough, the simple front of which faces the Guards' Club in Pall Mall. It is no secret that the *raison d'être* of the Marlborough is to give the circle in society of which the Prince of Wales is the genial and distinguished centre, a common place of meeting. Here the younger members of the aristocracy, and those who have gained admission to their society by their social qualifications, resort habitually. Common rumour declares that life in the Marlborough is rather more jovial than it is at White's and some older, though not more fashionable institutions; and it may be mentioned that one of the attractions of the place is an American skittle-alley, where the aristocratic members of this little club indulge in that recreation. From White's and the Marl-

borough down through many gradations of rank, the purely social club may be found. There are clubs for country gentlemen; clubs for university men; clubs for men who unite to unexceptionable social qualifications a passion or affection for foreign travel; clubs for hunting-men; clubs for those whose tastes are learned and severe; and clubs for those whose chief predilection is for exceptionally good cookery and wines of the rarest brands. At the Windham you will be served with a dinner which could not be beaten at the Palais-Royal; at the Travellers' you will be gratified with wines which can hardly be found upon another wine-list in London; at the Athenæum you will (should you be elected a member, but not otherwise) enjoy the most intellectual society and one of the best libraries in England. Every man to his taste. Even if your taste is for deviled bones, dry champagne, and unlimited loo at two o'clock in the morning, there are clubs at which it can be gratified.

The 'twin giants' of the political clubs are the Carlton and the Reform. Those splendid buildings, standing side by side in Pall Mall, may be likened to the headquarters of the Conservative and Liberal parties. Architecturally, they are among the most imposing of all the London clubs; but it is sometimes whispered that their social status has been to some extent affected by their political character. There are no clubs which are objects of greater mystery to the outsider than these political clubs. The people who have never sojourned within their walls labour under the delusion that all the secrets of the Cabinet or of the Opposition are floating about in those halls and corridors; that the talk of the members runs constantly upon Ministerial manoeuvres; upon public appointments, the probable result of debates in the House of Commons, and the course of 'high politics' generally. It is a pity to destroy such illusions, but the truth compels us to do so. The fact is that enthusiastic politicians constantly complain that these political clubs are political in little more than name, and it is undoubtedly the fact that the talk that may be

heard within their walls, so far from having the serious purpose which the novice would expect in it, is ordinary club-talk and nothing more. There are, of course, political committees in connection with these clubs, and the political committees sometimes bestir themselves to pass a resolution, or vote a grant of money, or recommend a candidate to some borough which is in the unusual plight of wanting one; but beyond this, even the great political clubs do comparatively little to advance the interests of their respective parties. Their chief object is to provide a social house-of-call for the members of each party, and thus to prevent those seductions from their ranks which have frequently been accomplished by social influences. To have a good cook, a good cellar of wine, and a first-class library, will seem much more important to the chairmen and managers of the Carlton and the Reform, than to have that underhand political power which is properly vested in the 'whips' of both parties. And is there, then, nothing to distinguish these great institutions, the names of which are familiar to every English elector, from the ordinary social club? It would be saying too much, were we to answer this question in the negative; nevertheless, the distinction between the political and the social club is a very slight one. The former is supplied with files of Hansard, with copies of all the parliamentary papers, with an unusual number of blue-books and foreign political journals; the reports of the proceedings in both Houses of parliament are hung up in the hall or the morning-room hour by hour, and there is always an unusual bustle whilst the Houses are in session. Then, too, the humble member from the country may sometimes find himself washing his hands in the next basin to that in which the hands of a Cabinet minister or of some leader of the Opposition are immersed; and great numbers of members of parliament may be seen writing their letters, dining, or even engaging in a quiet game of afternoon pool, during the session. But members of parliament, and even Cabinet ministers, are very like other people; and nobody, to look at him, would suppose that yonder gentleman peacefully dozing over a magazine was a Secretary of State, or that the well-dressed person who has just strolled out of the other club smoking a cigar, is one of the leaders of the Opposition. Not the least important features of the Reform and the Carlton clubs are perhaps to be found in their architectural beauties. The magnificent hall of the Reform and the stately staircase of the Carlton are among the sights of London which every country-cousin should make it his business to behold.

There are, of course, other political clubs besides these. The Conservative in St James's Street, the Junior Carlton opposite the War Office in Pall Mall, and the St Stephen's, an imposing new building on the Thames Embankment, are all devoted to the followers of the Conservative Ministry; whilst the ugly brick building in St James's Street occupied by Brooke's Club is the select and sedate home of the Whig aristocracy; and the more imposing edifice once known as Crockford's gaming hell has recently been converted into the Devonshire Club for the use of the younger Liberals of our day. No doubt, also, our readers have read reports of the Cobden Club dinners and brief notices of the meetings of the Fox Club. These, however, belong to an entirely different class of clubs from those

which it is the purpose of this paper to consider. They are without settled homes of their own, and merely consist of a certain number of gentlemen who meet together at stated intervals for dinner, discussion, and the transaction of business. Of another type is a well-known Radical institution called the Century Club. The Century occupies a room in Pall Mall Place reputed to have been once upon a time the drawing-room of Nell Gwynne; and here, on two nights a week, may be found, during certain months of the year, a select assemblage of Radical members of parliament, journalists, authors, and lawyers. The proceedings of the club are of the most informal description. On a big table the visitor will observe a large collection of bottles of aerated waters, together with sundry flasks of spirits, and hissing urns of tea and coffee. On another table there is a plentiful supply of long clay-pipes, of tobacco jars, and of cigarettes. As each member enters the room he helps himself to these commodities, suiting his own taste both as to what he drinks and what he smokes. No waiter assists him, nor does any one expect to receive payment for the articles he consumes. The Century Club is the very type of a high class 'free-and-easy.' Supported by the subscriptions of its members, it offers unlimited hospitality to all who come within its doors.

The military clubs occupy the foremost place among professional clubs. Of late years their growth has been prodigious; and all branches of the service have their 'senior' and 'junior' clubs. The Guards' Club in Pall Mall is in its way the most select of these institutions; but the Army and Navy Club—familiarily known as 'the Rag'—and the Senior United Service Club at the bottom of Waterloo Place, have their own claims to consideration. One of these military clubs occupies Lord Palmerston's old residence at Cambridge House; and another has just created for itself a home more gorgeous than beautiful, next door to Marlborough House. Soldiers, as the reader will readily suppose, are among the most clubbable of men; and many a poor officer in India consoles himself for the fatigues and discomforts of station-life, by looking forward to the moment when he will once more pass the portals of his beloved club in Pall Mall or Piccadilly, and revel in the luxuries that await him there.

Artists, authors, medical men, lawyers, civil engineers, and parliamentary agents, all have their own clubs. Some curious stories might be told of some of these clubs. In the parlours of Fleet Street, for example, there was not long ago a certain club, which may be called for distinction's sake 'the Flybynight.' This queer little establishment, which was uniformly dirty and disreputable in appearance, was intended for the accommodation of the reporters and sub-editors of the daily papers, who, being compelled to work during the greater part of the night, were thankful to have a house-of-call open to them at all hours. The pen of Mr Thackeray would be needed to do justice to the company the privileged visitor might meet with there at two o'clock in the morning, when, the immediate pressure of business being over, weary sub-editor and reporter were at liberty to enjoy a frugal meal of cold beef or bread and cheese. Perhaps the most amusing feature of this unique place of entertainment, in which all the gossip of journalistic London was ever to be picked up, was

the earnestness with which the members insisted upon maintaining its character as 'a club.' Had they been sitting in one of the splendid apartments to be found in the Pall Mall palaces, they could not have had a greater idea of the dignity of club membership than that to which they clung in their miserable little Fleet Street hovel. But evil days fell at last upon the Flybynight; the newspaper and news-agency offices in the neighbourhood ceased to provide it with a sufficient amount of support, and it came to an untimely end.

The Garrick, famous for the number of literary men, artists, and actors who have from time to time sojourned within its walls, is no longer a literary club; it has become one of the fashionable social clubs, and is at this moment more celebrated for its coffee-room tariff than for the fame or wit of its frequenters. The Whitehall in Parliament Street, where civil-engineers and parliamentary agents most do congregate, is another professional club; but the Civil Service no longer has a club of its own, the excellent institution it once possessed having been converted into the Thatched House Club.

While in most of the clubs the utmost regularity and obedience to rules is exacted and observed, it is to be deplored that there exist a few in which men have deliberately banded themselves together in order to enjoy the worst of the privileges which the legislature allows to clubs; and that more than one institution of this kind is to be found which is practically dedicated to endless drinking and unlimited gambling. These, however, are fortunately the rare exceptions, and are, we trust, shunned by all who would maintain decency and self-respect.

It is pleasant to know that ladies are not now entirely deprived of the advantages of well ordered club-life; and in one case—that of the Albemarle Club—they are allowed to share one of these sacred retreats with the opposite sex. The drawing-room at the Albemarle is a pretty little room, bright with flowers and artistic furniture, where the initiated are allowed to gaze of an afternoon upon the rather curious sight presented by a club open to both sexes.

And now let us suppose, for the benefit of the young reader, to whom only the outside of these great buildings in Pall Mall and St James's Street is known at present, that he has just been elected a member of the Arcturus; in that case he will be naturally anxious to visit his club, and to make himself personally acquainted with the various privileges in which he has thus become a participant. Here, then, is the stately portico of the Arcturus, and beyond is the outer hall, into which our blushing novice steps bashfully. A couple of pages and a grizzled commissionaire are lounging in this outer hall, whilst to the right of the visitor as he enters, sits that potent functionary, the hall-porter. He regards you, my ingenuous friend, with some suspicion, for your face is unknown to him. You produce your card, however, and present yourself to him as a new member. Instantly all traces of suspicion vanish from his countenance, and he becomes at once the well-bred courteous servant, anxious to make a favourable impression upon a new employer. He has many masters to serve—for are there not a thousand members in the Arcturus?—but he will never henceforward forget what is due to you, as

the owner of a thousandth share in this palatial building, and will always be civil, attentive, and obliging, even if your demands upon him are at times unreasonable. Nor will he ever forget your face, having once seen it; and each morning, as you pass him on your way to breakfast up-stairs, you will find his hand outstretched towards you with your letters.

We pass next into the inner hall. It is not, perhaps, so grand as that of the Reform Club, but it is a spacious and comfortable lounge; furnished with luxurious couches, charming little easy-chairs, and writing-tables on which an abundant supply of stationery will always be found. Here you will receive your friends when they visit you, for the accommodation for strangers in the Arcturus is not so large as in some clubs, and most of the rooms on the ground floor are reserved for members. At one side of the hall are the doors leading to the lavatories and cloak-rooms; the coffee-room is entered on another side; and the morning-room is approached on the third. Let us enter the last first, for the morning-room is always one of the most important features of a club. We find ourselves in a magnificent apartment, lofty, well-proportioned, and luxuriously furnished, the windows of which look out upon the main street. Here are a dozen gentlemen writing letters at the little tables, or reading the newspapers and magazines which everywhere abound, there is even one individual so completely lost to the splendours of the room in which he sits, that he is dozing peacefully on a settee in the corner near the fireplace.

In the coffee-room of the Arcturus whither we now turn our footsteps, may be seen, between seven and ten o'clock every night, some scores of gentlemen laughing, chatting, and dining at the little tables which are spread throughout the room. Every variety of meal will be served, from the plain 'ent from the joint,' to the elaborate banquet of fifteen courses; but and this after all is one of the greatest advantages of club-life—the cook and the servants will bestow as much care and attention upon the simple dinner of roast-beef 'and its adjuncts,' as Brillat-Savarin used to say, as upon the gorgeous banquet in which all the delicacies in season are dished up along with half of those out of it. Some young men, when they first gain admission to good clubs, delight in making fearful and wonderful experiments in the ordering of strange dishes. They imagine that to present the steward with a dinner-bill in which half-a-dozen courses have been set down (generally in haphazard order), is to impress that functionary with a due sense of their own dignity and discretion. To such we would say, 'Avoid all such errors, and know that the club servant is quite as quick as any other student of human nature in detecting the hand of a novice in the preparation of a dinner-bill.' The superb cookery of a first-class club, the excellence of all the viands, the abundance with which all possible dainties are provided, tempt many young gentlemen to embark upon a career of gluttony—we can call it nothing else—from the effects of which they suffer throughout their lives. Look at the older frequenters of the club, however, and see with what regularity they confine themselves to a piece of fish and a slice from the joint, and learn from them the art of living well—and wisely.

We pass up the broad staircase to the next floor, and here we find the library, with its admirable selection of books for the beguilement of our leisure hours, the billiard-rooms, the card-room, and the two smoking-rooms. Need we give you a word of caution as to the amount of time you may spend in the last-named apartments? Their appearance is very seductive, we own. Very different are they in comfort from the frowsy billiard-rooms and smoking-rooms of even good hotels. But after all, the young man who spends all his afternoons at pool, and all his evenings in the consumption of choice cigars, tempered by potations of whisky and seltzer, is not the young man who is most likely to succeed in life, or to derive any benefit from his connection with a first-class club.

Club-houses of a respectable class are now found in the larger provincial towns, as well as in some large cities abroad. But nowhere are they so thoroughly classified or on such a grand scale as in London. Wherever situated, the imitative clubs of a later date—some of them got up by wine-merchants or by jobbing secretaries—not mutually labour under an obvious drawback. Starting on a fairly distinct principle, they year by year suffer a lowering in character, in order to secure members. For example, these clubs may at first include only middle-aged gentlemen, who are all good clubbable persons in their way, and who feel a pleasure in meeting and chatting with each other. But by-and-by young men, almost bald, get a footing in the concern, and the character of the club is changed. Instead of elderly gentlemen, noisy young men are seen lounging about, with whom the original members can have no intercourse. We know of more than one respectable club which is now in the process of rapid deterioration from a cause of this kind.

FALLEN FORTUNES.

CHAPTER XXIV.—ADVICE GRATIS.

It is said that it requires a very brave man indeed to take to his heels in the midst of a battle; and certainly Mrs Dalton shewed not a little courage in running away from her hostess, and thus avoiding a discussion, which some instinct told her would be painful to an extreme degree. If she felt any humiliation in leaving her apparent mistress of the field, it was more than made up to her by the sense of enfranchisement of escape from her unwelcome society; and when she sought that of Dr Curzon, who was talking with her husband in the library, it was with no intention whatever of returning to renew the combat.

Mrs Campden, on the other hand, would not perhaps have experienced much annoyance, even if she had waited for the reappearance of her guest for the next hour, for it would have convinced her that Edith was afraid of her—for hitherto Mrs Dalton had shewn no fear of her cousin—and been so far an acknowledgment of the new relations which disparity of wealth had established between them.

As it was, however, the bell sounded for kettle-drum in a few minutes, and ever alive to such domestic duties, she descended to the drawing-room

to superintend the tea-table. There she found Mr Holt alone; he generally presented himself at that intermediate meal, not that he ever partook of it, but because he knew that his presence was regarded as a sort of attention by his hostess, who did not find it easy at that hour to command the services of her gentlemen guests. She welcomed him on this occasion by a beaming smile, and then suddenly became overspread with gloom.

'This is a terrible misfortune that has overtaken our friends, Mr Holt.'

'Yes, indeed, madam. I cannot say how deeply I feel it.'

'You, however, do not, of course, hear of it to-day for the first time?'

'Well, no. I have had my fears—between ourselves—for some time respecting the particular investment the break-down of which has caused this catastrophe. I advised Dalton to get out of it; but you know he is difficult to persuade.'

'In other words, he is obstinate as a mule,' returned Mrs Campden frankly. 'I can easily imagine the trouble he must have given you to keep him straight even up till now.'

'He had always the best advice I had to offer him,' replied Mr Holt modestly; 'but he took fancies to this and that—a weakness greatly to be deprecated in business—and speculated'—

'And now, he has utterly ruined himself and all belonging to him?' observed Mrs Campden impatiently.

'I am afraid he has been very hard hit indeed, madam. Still, if he would be content to realise at a great loss, to be sure—or perhaps I should rather say, if he would consent to be freed from his liabilities'—

'That means bankruptcy, does it not?—Pray, take a cup of tea, Mr Holt.'

'Thanks. Why, no, madam; it is not bankruptcy. He has a notion, it seems—quite a chimerical one, in my opinion—that there is still something to be got out of this mine in Brazil. He is resolved to throw good money after bad by going out himself to St Jose'—

'Oh, I don't agree with you there, Mr Holt,' put in his hostess quickly. 'I think he can't do better for himself and for those belonging to him'

here she began to speak very impressively—than to go to Brazil. Things will settle down much better in his absence: his high-flown and extravagant notions, quite unsuited to his changed circumstances, are, I am convinced, not shared by Edith and the dear girls; they are simple in their habits, and will, if left to themselves, take a sensible view of their position. They are a little spoiled by flattery and incense, at least poor Kate is, but you will see that she will now be quite a different girl.'

'Indeed, I hope not, madam,' returned Mr Holt earnestly; 'in my humble opinion, Miss Kate Dalton can hardly change for the better.'

'I am sure Miss Kate Dalton ought to be very flattered, and I will venture to say *would be so*, if

she could hear what you say, Mr Holt. I am afraid she will not receive so many pretty speeches now, as she has been accustomed to, poor girl.'

'She will deserve them all the same, Mrs Campden.'

'Doubtless, doubtless: but those she does receive will be sweeter. It is a sad fall for her, when one remembers that it was only last season that she might have been a countess for the asking—or rather the asking was the other way—and now, of course'—Here Mrs Campden broke off to sip her tea, and instead of adding 'almost anybody,' as she had intended to say, she smilingly concluded her sentence with: 'Well, in short, "no reasonable offer," as the tradesmen say, is likely to be refused.'

'I suppose it will make a difference,' said Mr Holt thoughtfully.

'Of course it will; the girl is not an idiot.'

Holt started, as though he had been stung, and exclaimed, 'Mrs Campden!'

'There, pray, don't be angry,' returned his hostess, laughing outright, a very rare thing with her indeed; it was on that account, perhaps, that the laugh did not sound quite natural, and indeed expressed as much scorn as mirth. 'I had no idea that you City gentlemen were so dilident and unenterprising.'

'The most enterprising of us often fail, madam.'

'Yes, once or twice,' returned she quickly; 'but that is no bar to your final success.'

A curious change was manifested in both the speakers: the haughty and somewhat reticent Mrs Campden had become earnest and almost vivacious; the impassive man of business, usually so deferential in his manner to his hostess, had grown tenacious of his own opinion, and at the same time soft and gentle. It was with a sigh that might have been breathed by a woman that he replied: 'I would I could think so, madam; in any case, time and opportunity are necessary to recover from such reverses, and to encourage me to tempt fate anew.'

'You shall have them both, Mr Holt,' continued she rapidly. 'As my cousins will now remain for some weeks at Riverside, why should you not do likewise? You are very welcome to remain here, if you please.'

'But I am not sure whether Dalton, or indeed your husband himself?'—Mr Holt hesitated.

'I am mistress of my own house, sir,' broke in Mrs Campden imperiously; 'if I have asked you, that is sufficient. Mr Dalton will be off to town to-morrow, and you will have the field all to yourself.—Hush! there is some one coming.—Why, Kate, my dear, I thought for once you were deserting the tea-table.'

For an instant Kate turned a little white; it was her first meeting with her hostess since the tidings of her father's ruin; and though she had schooled herself to behave with equanimity, the effort cost her something; then her eyes fell upon Mr Holt, and she felt the hot blood passing into her cheeks, and flaming there. These two had been talking about her, some instinct told her at once; and though they had, unquestionably, a right to do so, she resented it exceedingly: every

nerve in her body tingled as though a designed affront had been offered to her.

'I thought you had been alone, Mrs Campden,' said she coldly.

'I have had my tea,' cried Mr Holt, rising with ludicrous haste, and sweeping the crumbs away from his legs with his pocket-handkerchief. 'I was just about to go when you came in.'

'Nay, nay; there is no reason for your going away from us,' said Mrs Campden in her most gracious manner. 'I think, by this time, my dear Kate, we may almost consider Mr Holt as a friend of the family. There is no one out of the family, I am sure, who regrets the misfortune that has happened to you all more than he does. Oh, my dear Kate, I am so distressed about it.'

This affectionate outburst was accompanied by an embrace, to which Kate submitted with the best grace she could.

'Blood is thicker than water, dear,' continued Mrs Campden confidently, 'and your best friends

till you come to have one dearer and nearer than even they—you will always find to be your relatives. Mr Holt here will do me the justice to say that I have just expressed to him'—She looked round for corroboration, but the witness she cited had disappeared. One of the drawing-room windows was open; and through it, finding his escape by the door cut off by his hostess, Mr Holt had quietly stepped on to the lawn, with a bow to Kate, by way of apology for having remained even so long as he had in obvious opposition to her wishes.

'Why, where on earth is the man gone to?' cried Mrs Campden with indignant astonishment.

'I suppose Mr Holt thought himself *de trop*,' observed Kate quietly.

'He was very foolish if he did; and I am bound to say, my dear Kate, since we are upon the subject, that you were still more foolish if you induced him to believe so. Mr Holt is a man of means, and indeed even of mark in his calling;—and there are very few girls, no matter what their position, who would be justified in treating his attentions with contempt.'

'I cannot understand how *any* girl could be justified in doing that,' answered Kate quietly.

'Well, well, you know what I mean. There are some young ladies—only a very few—who can afford to give themselves airs; and there are others—very numerous—who cannot afford it; it is well for them when they are not compelled by circumstances to put up with the airs of other people. There are governesses, for instance. I hope, my dear, I may never hear of *your* going out as such.'

'It is very likely that you may, Mrs Campden,' interrupted the girl calmly.

'Well, as I have just said, I hope not; but it is, of course, possible, if your father's ruin is so complete as we have reason to fear, that circumstances may compel you to take such a course. We should all feel it—your parents, your sister, and ourselves—as a great misfortune, though not, of course, in the light of a disgrace.'

'Indeed, Mrs Campden, I hope not,' answered Kate haughtily; 'my father's daughter is, I venture to believe, incapable of bringing disgrace upon any member of his family.'

'Of course, of course; I don't mean *that*,' returned her hostess quickly. 'But your taking one

up so sharp, is just an example of how unfit you are to undertake any subordinate position. If you were a governess, you know, people would say what they liked to you; that is, they would speak their minds very plainly; I always did so to Mary's governesses.

Kate inclined her head assentingly; she had every reason to believe the statement.

'Well, here is an opportunity, my dear girl—at least he has just gone out of the window—of avoiding this most unpleasant contingency.'

'If you please, Mrs Campden, I would rather not talk about this matter,' said Kate, looking up very flushed, and with quivering lips.

'But that is exceedingly foolish. Why hesitate to discuss what is not a mere theoretical affair, but something which is certain to happen; why refuse to hear any mention of poverty, when you are about so soon to feel its sting?'

'I feel it now, madam—at this moment,' returned the girl with intense significance. 'But it was not to our poverty that I was alluding; you are welcome to dwell on that to your heart's content. But with respect to any—with respect to that gentleman's pretensions to my hand, for to such I am compelled to believe you refer, I will not be schooled; I will not listen to you; it is a matter with which you have no concern whatever, while God still leaves me a mother.' For a moment the bitterness—the sense of the harshness of fate—which the young girl felt in her heart of hearts, was permitted to manifest itself in her tone; but the mention of her mother evidently softened it. 'I must beg, I must entreat, Mrs Campden,' she continued pleadingly, 'that you will never mention this subject to mamma. She could not endure it; it would pain and distress her to an extent that I think you are hardly aware of.'

'I am quite aware of it, my dear,' answered Mrs Campden composedly; 'and it is out of consideration for the state of her health and—and condition—that I have addressed myself to you. A mother, as you suggest, is the proper channel for such advice; but, in this case, it is for your mother's sake I speak, and she can hardly plead her own cause. I say nothing of your father, though his regret at seeing his dear ones reduced, through his own folly, to a position so foreign to their experience, must indeed be poignant; nothing of your poor invalid sister, henceforth compelled to give up all those luxuries which to one in her condition are almost necessities; nothing of your little brother, so young that he is incapable of understanding the change that has shadowed his prospects. All these things can be remedied, if you please; but I speak of your mother only. She will never complain, of course; but she will suffer all the more. Every slight that may now be offered to her husband, in return for a sharp word in other days, will be felt by her sensitive spirit like a poisoned dart. The withdrawal of fine-weather friends; the open satisfaction of enemies: these things will torture her. She will see yourself—her pride and flower—no longer the centre of admiration among the dazzling throngs of fashion, but wearing out your days in poverty and seclusion, without a chance of such a suitor as she might of old have reasonably expected; some doctor or curate, or gentleman-farmer at the best, will necessarily fall to your lot: she will see Jenny'—

'Spare me!' cried Kate imploringly. 'Do you suppose I do not foresee these things as well as you—that they are not brought home to me here?' and she pressed her hand passionately to her heart.

'That may be so,' continued the other calmly. 'But what you evidently do not see is the reverse of the picture; the change that is in your power to effect by the utterance of a single monosyllable. It is not as if you were asked to sacrifice yourself—as many girls are called upon to do—at the shrine of mammon; you are not selling yourself to some miserable old man, who has only his gold to recommend him, and who has forgotten, if he ever knew, what love is. Mr Holt is a man in every way estimable, and who—as you cannot but be aware—is passionately attached to you. You will make him the happiest of men; and in time—for these things grow, my dear Kate; the fanciful affection of a girl for a lover she knows nothing about is not to be compared with the esteem and affection born of the duration of a husband—I say, in time he will make you the happiest of women. Of course you don't think so now.' Kate had turned very pale, and sank down rather than seated herself in an arm-chair. 'It is so difficult for a young girl to listen to the voice of experience in such a matter. That is why I preferred in the first place to speak of the material aspects of the question, a consideration of which must surely needs carry conviction. In accepting this gentleman you will confer inestimable advantages upon your family, to benefit whom he is only seeking for such an excuse; of course I don't mean mere mean gifts, Kate, though, whatever he may do for them under such circumstances, you may depend upon it he would feel the obligation to be upon his side. He has opportunities—golden ones—of putting things in your father's way, without any cost to himself whatever. I think these should be strong arguments, even though there were other means of extricating your family from their embarrassments; but there is absolutely none. This expedition of your father's to the Brazils, Mr Holt tells me, is a fool's errand.'

'You think that would be given up,' put in Kate suddenly—'that papa would remain with mamma, in case I—that is, if Mr Holt'—

'My dear Kate, I wouldn't precipitate matters for the world,' interrupted Mrs Campden; 'I think it upon the whole advisable that your father should take the voyage.'

'But you said it was a fool's errand.'

'Yes; but he will never be convinced of that without a personal experience. Heaven forbid, too, that any arguments of mine should induce you to take a hurried step in a matter so important; but I adjure you to lay them to heart. Remember, you are the only one to whom those you love can look for assistance—I mean, of course, for permanent assistance,' added Mrs Campden, while a tinge of colour deepened the extremity of her nose. 'It is not as if you had sisters to whom a similar chance might offer itself. Your parents have only another burden in poor dear Jenny, who must always be a source to them of expense, as well as anxiety.'

'Hush, for God's sake!' cried Kate imperiously. The flow of Mrs Campden's eloquence had been such as to drown the noise of the opening of the door, and she was quite unaware that Jenny

herself had entered the room. There she stood, white and wan as a ghost, with her magnificent eyes fixed full upon her hostess, with an expression of unutterable calm.

'Do not be distressed for me, Kitty,' said she, with exquisite softness. Then, in the clear, incisive tones that were habitual to her, she added: 'And as for you, Mrs Campden, I should indeed be sorry that any one beyond our own family circle should be troubled upon my account. That I should always—so long as I live—be a source of anxiety to it, has been, I am afraid, decreed by Fate; but as to my being a burden, I hope in that respect your apprehensions will not be realised.'

'O Jenny, how can you ever be a burden to us!' exclaimed Kitty reproachfully.

'In the manner that Mrs Campden has pointed out, dear,' answered her sister calmly. 'She has, with great good sense, and without that foolish fastidiousness that would keep some people silent upon such a matter, laid her finger upon our weakest point—namely, the expense which an invalid like myself must necessarily be to my father and mother, who are no longer in a position to bear it.'

For the first moment or two of surprise, the mistress of Riverside had looked anything but the superior being which, in comparison with her young guests, circumstances had recently made her; she had been discomposed, confused, and flustered; there was even a fleeting instant in which she had meditated an apology for having involuntarily wounded Jenny's feelings; but perceiving first no direct resentment in the girl's manner, and then that her own arguments had acquired an unexpected ally, she began to take courage.

'Of course, my dear Jane, I should never have spoken upon so delicate a matter as your illness, had I dreamt you were within hearing. But Kate and I were having a little talk upon a private topic, during which it became necessary to touch upon all the inconveniences to which, through your father's losses, your family would be now exposed.'

Jenny's eyes glanced to Kate and back again with the quickness of those of a bird.

'I by no means wish to inquire into this private topic, Mrs Campden,' said she firmly; 'but I should wish it clearly to be understood that any arguments founded upon my being an encumbrance to my parents—upon my incapacity to earn my own living—have been advanced in error. If any important step were taken by any member of our family—here she glanced again at Kate—'upon that supposition, it would be a great mistake; and if it involved anything of sacrifice, must needs be bitterly repented of, since it would have been made in vain.'

'But, my dear child,' expostulated Mrs Campden, with a certain maternal air, which perhaps, of all her mental disguises, became her least, 'it is perfectly ridiculous that a girl in your position—a confirmed invalid—can ever hope to obtain any situation, as a governess, for instance, or to make money by her own exertions. With all the goodwill in the world, you know, how is it possible that you are to do it?'

'My dear Mrs Campden, that is an affair of my own,' replied Jenny decisively, 'as private as your late topic with Kitty; and you must therefore

excuse my discussing it.—Here is Mary come at last. Manima is still closeted with Dr Curzon, by-the-bye, and bade me say she would take no tea.'

HINDU MENDICANTS.

It is remarkable that a religious profession and begging are so closely allied in the minds of the Hindus, that when mendicancy is adopted by any one of them as a means of livelihood, the first step taken is to assume the religious garb. Hence, nearly every Hindu beggar belongs to some religious order. He may be aged or blind, or lame or maimed; but it is not his infirmity that he pleads as rendering him a fit object of charity; it is his connection with the god whose worshipper he professes to be, and in whose name it is that he solicits alms. Hence, again, most of the Hindu mendicants are men well able to work for their own living, but have taken to a life of begging simply from a love of idleness.

The different orders of Hindu mendicants may be classed under two heads. First, the local mendicant, who, having taken up a permanent abode in some town or village, attaches himself to one or other of its temples, sweeping and cleansing it daily, and performing other offices needful in the service of the idol. Secondly, the wandering mendicant, or devotee as he is commonly called, who roams from province to province, and has no fixed dwelling-place. He affects the superior sanctity of an ascetic, and studiously avoids mingling with his fellows.

There is nothing peculiar in the habits of the local mendicant to distinguish him from the rest of the people, except his religious garb; but the members of the wandering class are so remarkable in their appearance, habits, and mode of life, that to many readers, a description of them may prove both interesting and amusing. The following episode, which fell under the writer's personal experience, supplies the description, and also affords some insight into phases of Hindu life.

It was in a secluded spot, close to a small brook, at some distance from the village of Mal-siras, that one of these devotees had taken up his abode. No one could tell whence he had come, and for his part he was careful not to enlighten those who sought the information. A sanctimonious motion of the finger towards the sky was all the answer they received, signifying either that he came from above, or that his wanderings were guided by a power which ruled there. He was middle-aged, short, and strongly built; his only shelter was the shade of a wide-spreading wild fig-tree, under which stood a small temple with an image of the warlike god Khanduba, an incarnation of Siva, the Hindu deity of destruction. His appearance, to the eye of a European, was calculated to create a feeling of disgust, not unmingled with compassion. His long hair, matted with mud, and tied in a knot on his head; his body besmeared with ashes; his

eyes bloodshot from the fumes of a preparation of hemp-tops, which he smoked incessantly; he sat, with an affectation of dignity, on a mat of palm-leaves, with his legs crossed under him—his hookah in one hand, the other resting on his knee—and seemingly absorbed in contemplation. His only clothing was a narrow strip of calico suspended before and behind to a string tied round his waist, to which also was attached, at the left side, a small leathern pouch containing steel, flint, and tinder for striking fire; and a dirty strip of cloth, doing duty for a robe, thrown over his right shoulder, and drawn carelessly around his otherwise naked body. His belongings consisted of a small bundle apparently containing a knife, a sickle, a pair of rude sandals, and other odds and ends of an equally primitive description; an earthen censer, from which from time to time he lit his hookah; a melon gourd from which to slake his thirst; two or three earthen cooking-pots; his mat, and a huge bamboo club mounted with iron, which, by way of protection, he carried about with him wherever he went. His forenoons were spent in religious observances, which consisted, first, of ablution; next, of besmearing his body with ashes, from a metal censer in the temple close by; in numerous prostrations before the idol; and lastly, in repeating the names of the principal Hindu gods and goddesses, the number of times each had to be invoked being regulated by a string of beads which hung round the wrist of his right arm. This ritual, and the preparation of his only daily meal, occupied him till noon; when, having eaten till he was scarcely able to move, he would throw himself upon his mat, and sleep till late in the afternoon. On rising, he would receive visits from the people of the village; and towards evening he would be seen roaming in an adjacent wood, picking up sticks to feed his fire during the night, and to cook his next day's meal. His nights were spent in apparently wakeful solitude.

Such was the strange being whom the ignorant and superstitious Hindus, particularly the women of the village, looked upon with feelings by no means akin to those which would fill the mind of a European. To them he was a holy man, worthy of worship and adoration; they supplied him with coppers, brought him rice, wheat-meal, sugar, dried dates, and cocoa-nuts; and having offered them to him, they would prostrate themselves at his feet with feelings of the deepest reverence. To have their foreheads anointed with ashes from his censer, and to hear the word *Ashirwada* (blessing) uttered by his sacred lips, was to many the only boon they sought; while the childless prayed that they might be blessed with offspring, the ailing with health, the poor with bread, and others according to their various needs. These petitions were invariably answered by an assurance of their being speedily complied with; the consequence of which was, that the people thought they were fortunate in having such a saint, whom they called *Bawa*

(father), sojourning within the limits of their village; and the *Bawa* on his part, although of a taciturn nature, expressed himself satisfied with the reception accorded to him by the good people of *Malsiras*.

An intelligent and wily Brahman was almost the only member of the community who stood aloof from any manifestation of regard or respect for the seemingly holy visitor. As a man of the world, he smiled at the credulity of the less intelligent portion of the inhabitants; as a member of the priestly order, he keenly resented what he considered an unwarrantable encroachment upon his personal rights as spiritual guide to the community, and hence solely entitled to all revenues arising from exhibitions of religious sentiment. He could not prevent the reverence which was being shewn, nor the gifts which were being lavished on the *Bawa*; but he foretold evil, and with what foresight the sequel will unfold.

Among those who waited on the *Bawa* for his blessing were a number of *Ramusis*. The *Ramusis*, a tribe of aborigines, are the recognised watchmen of the villages in the *Deccan*; and no doubt some of them are faithful to the trust reposed in them; but as a rule, they are the authors of most of the depredations committed on the well-to-do portion of the community. They worship the Hindu gods, but attach themselves particularly to *Khandoba*; which circumstance may in this instance have brought them into contact with the *Bawa*. Their visits to him were made during the night, when the rest of the people were least likely to see them with him. They too believed in his supernatural powers, as much as the other ignorant portions of the villagers, and like them, had their particular boon to ask.

The *Wani*, a tradesman who was the corn-chandler, grocer, oilman, draper, and general shopkeeper of a neighbouring village, had proved refractory. He had, although repeatedly threatened by him, steadily refused to meet the demands in full of the *Ramusis* of his own village, for services rendered, and was therefore marked out by the fraternity for legitimate plunder. He was the only *Wani* of his small village, and therefore monopolised all the custom of it, as well as that of some of the neighbouring villages. He and his wife were old and childless; they had for many years been exiles from their own province of *Gujerat*, and during that time had laid by a considerable sum of money, much of which was buried in brazen pots in different parts of their dwelling. The old man's sole object was to add a little more to his savings, return to the place of his nativity, and spend the remainder of his days in quiet and comfort. The village where he resided, *Raidni*, lay about six miles to the north of *Malsiras*, the *Nira River* flowing midway, and dividing the lands of the two: *Malsiras* lay within the territory of the then *Rajah of Sattara*; *Raidni*, within that of the *East India Company*, in a district which at the time was in charge of a European officer, who was never found napping in the matter of his police duties. It was therefore a hazardous undertaking to attempt a burglary at *Raidni*, and hence the visit of the *Ramusis* to the *Bawa*. Would he throw the

mantle of his protection over them? Would he promise that they would prove successful, and escape detection?

The Bawa, having the popular notions of a Hindu, could have felt little if any compunction in giving a ready response to the prayer of the Ramusis. Were they not thieves by profession as well as by birth? Had not the Supreme, in creating a caste of the kind, intended that they should subsist by theft? And was he not, therefore, furthering the designs of Providence, in encouraging them to follow the profession to which they were born? Did not the Wani deserve to be punished? And who had a better right to punish that pernicious tradesman than the caste, a member of which he had defrauded? The Bawa, however, was not blind to his own interests; and in complying with the desires of the Ramusis, he made this stipulation, that a portion of the spoil should fall to his share.

Elated with the prospect of their booty, and the immunity promised by the Bawa, lots were cast as to those members who should comprise the gang to be engaged in the burglary. Fourteen—a propitious number—were selected; and the first, and therefore the darkest night of the lunar month was fixed upon as that on which the house of the unfortunate Wani was to be attacked. The closing act previous to starting was to meet at the temple of Khairuba; there, in a body, solemnly to vow eternal allegiance to him in case of success; and to call down his dire displeasure upon any member of the gang who should prove false, by giving information against the rest.

It was about midnight when the fourteen upon whom the lots had fallen, armed with swords and bludgeons, made their appearance at the door of the Wani's house. They had no trouble in effecting an entrance; and having ransacked the place of everything of value that they could carry away, they left the village in high glee at the success which had attended their enterprise. So far from any resistance being made by the Wani, he was, through fear of being murdered, glad to shew where his valuables and treasure were hidden; and these were carried away with the rest.

The people of the village were aroused; but no one ventured to run the risk of being maltreated, if not seriously injured, for interfering in behalf of the Wani. In short, they felt little if any sympathy for him; for he, it must be said, was in common with others of his class, no favourite of the villagers. He, like the other Wanis of the district, was extortionate in his dealings; and the people looked upon him and his brethren as little if any better than the Ramusis themselves. 'The one class robs us at night, the other fleeces us by day,' was indeed a common saying among them.

The Patil, head-man of the village—who was a kind of revenue and police officer combined in one, on seeing what had happened, as in duty bound, started off a messenger to the European officer in charge of the district, to inform him of the burglary. A distance of fourteen miles separated that officer's residence from Raidni; and it was not till about 3 A.M. that he was roused from his slumbers, to start with a few armed followers, mounted and on foot, to the scene of the burglary. The eastern sky was beginning to shew signs of

approaching day, when the party reached Raidni, and no time was lost in giving chase.

In nothing is the old proverb, 'Set a thief to catch a thief,' better exemplified than in the plan adopted in the Deccan on such occasions. The village Ramusi, looked upon as a professional thief, is expected to track the footsteps of the perpetrators of every robbery. The Ramusi of Raidni was therefore summoned at once to perform this part of his official duties; and he was not long in leading the party to the spot at which the burglars had recrossed the river on their return home. Here he made a stand, meekly pleading that the stream had obliterated any further marks of footprints, and that it was therefore impossible to proceed forward with any degree of certainty.

There was, however, a much more serious obstacle to proceeding forward than that which the Ramusi pleaded. To pass the boundary which separated the territory of any independent state from that of the Company, on an errand of the kind, was to transgress a stringent order of government. But was not this an exceptional case? The officer determined to proceed, and a flourish of his whip by way of threat, soon convinced the Ramusi that trifling was out of the question. So on they went, crossed the river, which at the spot was but knee-deep, and went along the opposite bank to the point where the burglars had continued their retreat. From thence, following up the track, they very shortly after sighted Malsiras; and on approaching the village, it was observed that a number of Ramusis were collected in front of their huts. On seeing the party advancing, they came forward, saluted the Sahib most obsequiously, and expressed their readiness to continue the track of the 'vile burglars.' To this the Sahib had no objection; but in the meantime, by a preconcerted plan, he insisted that two of their number should be handed over to him as hostages, for the good conduct of the rest in following up the track, which had been traced to their village. This led to a panic, and a general attempt at escape; but it failed; ten of them were secured, and presuming that they were the delinquents, they were walked off in triumph to the principal town of the district in which Raidni was situated, and confined in what might be called a police station.

suffice it to say that, being subjected to rather hard fare and harder treatment, one of them, a mere stripling, turned approver; and eventually the rest of the gang were apprehended with a large portion of the stolen property. Thirteen were convicted, and sentenced to imprisonment with hard labour for a number of years, and the approver liberated.

It came out during the trial that the mendicant had to a certain extent encouraged the burglars, if he had not actually instigated them to commit the burglary, and means were therefore taken for his apprehension; but he was not to be found. When the Ramusis were being taken one way, he had been seen walking off in a directly opposite direction, with his club thrown over his shoulder, his belongings strung to the upper end of it, and he pulling away lustily at his hookah.

The European officer did not escape a reprimand for infringing the orders of government in crossing the boundary which divided the two states. It was plain, however, from the covert nature of the reprimand, that it was merely formal, and that his

superiors duly appreciated the motives which prompted him to act as he had done. By his zeal and intelligence he rose rapidly in the service; and many years afterwards, when passing through Malais on much more important duties, he was led to make inquiries about the unfortunate Itamusis who had been imprisoned for the burglary.

He ascertained that only two had survived the period of their sentence, and that they were then residing in the village; the rest had been carried off by cholera at different periods of their imprisonment. But, lamentable to say, his inquiries regarding the stripling who had turned approver elicited the painful fact, that, a short time after his return to the village, his dead body was found, horribly mutilated, in an unfrequented part of the wood in which the Kawa was wont to take his evening strolls. There was but one opinion as to the perpetrators of the foul deed. The caste could not suffer such a renegade to live.

No endeavour had been made to detect the murderers. An obscure outcast was not worth the trouble.

AN ADVENTURE ON THE CLYDE.

IN TWO CHAPTERS. CHAPTER II.

My brother followed me from the room, and whispered: 'This looks rather a bad business, Mary; but still it is quite possible they may turn up safe enough; and so long as there is hope, you must keep her up. I am glad you offered to go with her.'

Tom was standing dressed at the head of the stairs. He had heard Mrs Nisbet's sobs, but did not like to come down, and was eager to know what was the matter. I told him as briefly as possible what had occurred.

'Poor Mrs Nisbet!' he said; 'can't I do anything to relieve her mind; take a run along the beach or something? They are sure to turn up, you know; but I daresay she can't help worrying.'

'You might look about to see if you can find any trace of them, as soon as it is light,' I said; 'but it would not be of much use just now. But I must run down to her. Your father and you can talk it over presently.'

When Mrs Nisbet and I went in, we went at once to her own room, where baby was lying asleep in his pretty blue-and-white bassinette, and the nurse sitting half asleep and rather aggrieved-looking beside him. Jane evidently had not understood her master's danger, or her mistress's state of mind, and she was preparing to depart, vaguely wondering what I was doing there in a dressing-gown at one o'clock in the morning.

'Mrs Nisbet,' said I, 'don't you think we ought to have good fires put on in the kitchen and dining-room, and dry stockings and things looked out, before Jane goes to bed? They may have come ashore at Toward Point, and may be coming home by the road, wet through.'

'Oh, certainly; I wonder I never thought of that myself,' said Mrs Nisbet, who, as I expected,

had roused up a little at the thought of having something to do.

'You were in such a hurry to weep over their drowning, that you had no time to think of the far more likely event of their return, dripping wet and starving with hunger,' said I, trying to speak as cheerfully as I could.

But when all was done, and she had sat down in the dining-room, where the supper was laid, and the slippers, &c., warming on the fender, the same painful look, almost like despair, came into her eyes as she murmured: 'How strange it will feel to put all these things away, when we have given up hope—if they never return!'

We got our anxious friend persuaded to take a little refreshment, and afterwards to lie down beside baby, who was getting restless. I then took away the lamp in Mrs Nisbet's room, seeing that she had become very still and had her eyes closed, for I thought she might be asleep; but I came and peeped in every now and again, to see if she were quiet. I was coming up-stairs on a similar errand, just as the first faint gray light of dawn was beginning to struggle with the darkness; but before I came to the door, she called me in a kind of intense whisper to come in and not be afraid to tell my news, for she 'knew the worst.' She was sitting up in bed, pushing back her long hair from her temples with both hands.

'I have no news,' I said, feeling rather alarmed at her wild scared look. 'But it is getting light now, and they will now be able to see their way home, which, of course, they could not do in the dark.'

'They will never come home,' she solemnly replied. 'I have just seen John. I was lying broad awake, looking at the firelight playing on the curtains, and listening to the waves, when all at once I saw a great green wave curl itself up like a wall, with a white crest of foam; and I saw John's face through it; and then it seemed to fall with a loud noise and a hiss of broken waters, and then it all disappeared. It was only for a moment; but I saw his face quite distinctly; he was deadly pale, and his eyes were wide open. I thought Charley was somewhere on the beach; but before I had time to look, the whole scene was gone.'

'You must have been dreaming,' I cried, inwardly reproaching myself for having left her a single moment alone.

'No,' she said, in the same whispering, awed voice; 'I was not dreaming. I had been praying. I had opened my eyes, and was watching the firelight, as I told you, and wishing—oh, so earnestly—that I could know what had become of them, when I imagined I saw a green wave rise up before me, and my husband's face in it. Oh, it is terrible to think of his being tossed about by that angry sea! Perhaps those cruel waves are dashing him against the rocks now. I must get up,' she pursued; 'the sea sounds so loud when I am lying here.' She rose, and proceeded to dress; while I sank into a chair and watched her, too bewildered to utter a word. Presently she came and sat down on a footstool beside me, and said: 'Do you remember the other evening, when I was telling you how happy I was, you told me to hush, for it sounded ominous to talk of perfect happiness in this world! And is it not a strange coincidence that with the first light of dawn on the anniversary of my marriage, God should send

a vision to tell me I am a widow! I am a very young widow, am I not? I am not twenty-one yet, and life looks so dismal and lonely.' Then, burying her face in my lap, she said with a groan: 'Oh, if God had only taken baby and me instead!'

'Hush! hush! my dear; for mercy's sake, don't go on like that, frightening an old woman out of her wits. We don't live in the times of John the Evangelist, and things are not told to people in signs and visions. Do try to be reasonable.' It went to my heart to speak to her so harshly, but I hardly knew what to say. To sympathise with her would have only made matters worse.

It was now getting quite light, and she walked steadily into the drawing-room, pulled up the blind, and looked out at the sea. She stood so for a time, and said: 'I will try still to hope, till the "sea gives up the dead."'

'Or the living,' I replied.

After a while she said: 'You must be very tired sitting up all night. Won't you go and lie down? I assure you, you need not be afraid to leave me—I am quite calm.'

'You must not send me away,' I answered. 'I am not at all tired, and could not sleep; but I should like a cup of tea.'

'Then I will go and prepare it,' she said, rising, as if she were glad of something to do.

Happening to look out after she had left, I saw Tom waiting on the door-step. I went and opened the door; and he told me that he had walked about two miles along the shore, but could see nothing—not even a capsized boat. 'Which shews,' said he, 'that they certainly have not been upset hereabouts, and most likely they are still in her. It is about a quarter of an hour since I came back,' he added; 'but I thought I would not ring, for fear Mrs Nisbet might think they had come, and then have been disappointed.'

The servants were soon stirring; then baby woke up, and had to be attended to. I ran in for a few minutes to tell my brother about Mrs Nisbet. He was not inclined to attach much importance to her vision, and said he saw no reason why we should apprehend that the worst had happened.

'No,' said Tom; 'it would be ridiculous to give them up for lost, when very likely they are on their way home. It is easy enough to understand how they might get drifted down the Firth, and not be able to pull back before daylight. Or they may have taken shelter on one of the Cumbraes; or may even be ashore at Rothesay. But depend upon it, the worst is just that they have been tossed about on the sea all night.'

'You are quite right, Tom,' said his father. 'It is very probable they have landed somewhere quite safely; and if it had not been Sunday, might have been back with one of the early steamers. As it is, I fear we must bear the suspense. We can't expect a letter or telegram either. It is most unfortunate it should be Sunday; but I do think that they will be here by the evening. They will be as anxious to get back as we are to see them, unless the worst has really happened.'

'But the chances are twenty to one against it,' chimed in Tom, with his usual impetuosity.

Towards the afternoon, Mrs Nisbet was sitting at the window, looking wearily out to sea. I could so well understand the aching dread that

was gnawing at her heart. Our hopeful arguments and surmises were almost stereotyped by this time, and I could only press her hand silently. All at once I observed her straining her eyes to the opposite shore with an intensity of eagerness. I looked in the same direction, and saw a small boat at some distance, and apparently coming straight across.

'It is coming here,' I cried.

'Wait!' she said in a hoarse whisper. 'We cannot tell who or what may be in her.' She stood close to the window, watching the little boat as it rose and fell with the waves. I ran to bring the field-glasses—for we had a very good pair—and handed them to her. 'Look first,' she entreated; 'I dare not.' And she stood with clasped hands, while I steadied the glass and brought it into focus.

'I see four men in her,' I said: 'they are all rowing, but their backs are towards us. Now, one turns round, but he is only a boatman; and—Ah! yes! I am almost sure the one with the dark hair is Mr Methven!'

'Let me see,' she cried, seizing the glass eagerly; but her hand trembled so, that she could scarcely hold it. When she had managed to steady it, she cried: 'Yes; they are there! John and Charley both'—and she staggered back, and fell in a dead-faint.

It was long before she could be brought round, and her husband's footsteps were heard on the gravel outside as she shewed the first signs of consciousness. He came rapidly but softly into the room, and sank down on his knees by the side of his wife's sofa, and taking her hand in his, and looking up to me, he said: 'She must have suffered a great deal, poor darling.'

'Yes,' I said; 'she had almost given you up for lost.'

She opened her eyes, and looking in her husband's face, she murmured: 'It is really you, John! You are not drowned?'

'Do I look like a drowned person?' he answered, smiling.

'No—not now,' she replied. 'But when I saw your face through the big wave, it looked drowned then.'

'Why! what does she mean?' he exclaimed, looking anxiously at her, for he feared the suspense had told upon her reason. Mr Methven had come into the room and sat down near his sister, but he did not speak, and my brother stood behind.

'It is a dream she had this morning,' I explained. 'She thought she saw a great wave rise up before her, and your face appeared to look through it.'

'It was no dream,' she said, trying to raise herself, and stretching out her hand for the wine and water I had been vainly offering to her before. She drank the wine, and turning to her husband she added: 'I was wide awake, though I was in bed; and I started up as I saw the wave curl up all green and smooth, and white foam at the top, just as they do when they break on the shore; and your face looked through the water as pale as death, and the eyes wide open; it was just for an instant, and then the wave fell with a loud noise; and then I heard the hiss and rush of waters, as if running up the beach. I thought you were somewhere near too, Charley,' she said, turning to her brother; 'but it all vanished before I had time to identify you. Can it have been a dream, I wonder?'

'When did this take place?' asked her husband excitedly.

'Just in the first gray light of the morning,' said I; and his wife nodded.

'Why, it is the most extraordinary thing!' said Mr Nisbet, turning to his brother-in-law. 'It was just about then that our boat capsized, as we were trying to run her on to a small island, and I was sucked up by a wave; but before I was flung on the beach, I opened my eyes and thought I saw you, Kitty, sitting up in bed. You looked frightened or distressed, and were pushing your hair back with your hands.' (I gave an involuntary exclamation, for she was looking just as her husband described, when I went into her room at the time she told me she saw him.) 'It was all over like a flash of lightning, but it was as vivid as it was rapid. I saw the whole room quite distinctly, and baby on the bed. I thought I must be dying, and that my spirit had been allowed a last look at you before quitting the earth for ever. For,' added he, bending over his wife, 'I felt as if it were really you, and not a vision, I had seen; but the whole, thoughts, vision, and all, passed, as I said, like a flash of lightning, and I was flung on the beach stunned; for I remember nothing more till I recovered in the cottage into which I was carried.'

'It is very strange! The strangest thing I ever heard,' said Mr Methven. 'John told me of his dream or vision, after he recovered; but I thought nothing of it then. The wonderful thing is, how you should have seen each other. I suppose we may call it a case of double clairvoyance; but I always fancied that sort of thing was all humbug.'

'Oh, don't talk about it any more,' entreated Mrs Nisbet, shuddering. 'I fear I shall never forget that face in the wave, John; I never expected to see you alive again.'

'My poor darling!' he murmured fondly, tightening his clasp of her hand, and looking earnestly in her face.

'But come,' she said, 'tell us all about it; you have told us nothing yet but that you were capsized on a small island.'

'My dear Kitty,' explained her brother, 'we got drifted out, and could not get in again; but we are here all alive, and so little like drowned people, that we are awfully hungry; and I for one won't satisfy anybody's curiosity till I have eaten and drunk.'

'Such a worthy resolution deserves to be seconded,' said her husband; 'so, Kitty, I will ring the bell, and tell them to bring in something.'

'Oh, I will go down and see after supper, if Mrs Nisbet will allow me;' and going to her, I whispered: 'Wouldn't it be well to have things as we arranged yesterday?'

'Yes,' she answered, smiling; 'I will try to go down with you, and make it nice.'

'No, no,' said I. 'You are not able to do anything of the kind; I will soon arrange everything.'

'Thank you,' she replied. 'I don't know how I can ever thank you enough.—John,' she said, turning to her husband, 'if it had not been for Miss Mackinlay, I never could have got through last night and to-day.—You must all come and take supper with us, you know,' she added with a meaning look; an invitation which her husband seconded, with many warm expressions of thanks.

With the assistance of the willing handmaidens, we soon had the table spread with the pretty,

dainty little dishes, which had all day kept intruding themselves on my mind in the light of anything but a 'wedding-feast;' and really the table looked very pretty, with the baskets of flowers 'the bride' had arranged the previous day.

Mrs Nisbet was a little giddy and faint when she rose, and there was a little bustle about getting her down-stairs and seated; so that the splendid nature of the feast did not strike anybody till we were all at the table.

'Hollo, Kitty! What's this?' inquired John, as he took up the carver to plunge it into the breast of a turkey, whose gay adornments had just then come under his observation. 'Have you been endowed with the wand of the conjurer? Champagne too! Why, this is like a wedding-feast!'

'Don't you remember, John, that this is the anniversary of our marriage? And I had prepared those things in honour of the day. It is more appropriate now than ever, since we have been united again after such'— But here a sob choked her voice.

At last, when the substantialities had been disposed of, we all begged them to relate their adventures. So Mr Methven began.

'You know,' he said, 'that we took out the boat for an hour's fishing last night, a little before eight o'clock. We went to the usual place, and let down our lines. There was a little swell, but we did not think anything of it. It seemed to increase, however, and it began to rain; and after fishing rather less than an hour, we drew in our lines and decided to give it up; but on proceeding to haul up the anchor, we found it had been dragging, and that we had drifted a good way out. We took to the oars, and pulled as hard as we could, but did not appear to get any nearer the shore. At last, when we had rowed till we were almost exhausted, and it was getting dark, I looked round to John, who was sitting behind me, and observed: "It looks as if we had got ourselves into a fix, doesn't it?" "Rather," he said; "but we must not give in yet: come, pull away." Which we did, as if we were pulling for our lives; but it was no use. We stopped to take breath, and on looking round again, instead of finding ourselves nearer the shore, it was almost invisible. "It is the rain and darkness hides it from us," said John; "I think we must be really nearer. Come, let us have another try." We rowed in a kind of desperation for a time; but the darkness increased so fast that we could hardly see a couple of boat-lengths, and were obliged to draw in our oars and give it up. We sat and looked at each other in silence for a while. For my part, I had just begun fully to understand our position. We could not tell north from south, and had no idea in what direction Inellan lay, so that it was no use rowing; the only thing we could do was to sit and wait for daylight. John was the first to speak. "Well, Charley," he said, "we are in for a night's tossing on the waves, and a thorough drenching, I fear; so we may as well make up our minds to it. It is impossible to find our way home till daylight." "And where we shall drift to in the meantime, goodness knows," I rejoined. "I should not mind it much, if it were not for Kitty," said John, "she will be so anxious." "If we had only taken her advice and staid at home," I added. "I wish, with all my heart, we had; but wishing won't put us

back again." We could not talk much, however, but sat and looked at each other as long as we could see, and then spoke a word now and then, simply for the sake of hearing each other's voices. But the hours were terribly long.—Weren't they, old fellow?"

"Ay, that they were," replied John. "There is no more trying position for a man to be placed in than to sit still, with all his energies strong within him, eager to grapple with the danger that menaces him, and to feel that he is hemmed in by the inevitable, that he can do nothing but sit and wait—waiting is so hard."

"Just what I felt," responded his wife. "With me, waiting was agony."

"It must have been terrible for you, Kitty," said her brother. "But we found it a pretty tough job too, through these long hours, with the spray and the rain running down our backs. Thinking of you, bothered us sadly; and John had the additional trouble of the baby on his mind; though, for my part, I never remembered the young fellow's existence till his papa happened to mention him. Then there was a thought at the bottom of both our hearts which we tried to keep there, but it would come to the surface: I mean the thought, that it might be we should never see dry land again. And then, I caught myself musing with self-pity and disgust on the fact, that I, who had crossed the Atlantic, and had taken part in dangerous adventures more than once, should come and be drowned in a miserable mill-pond like the Clyde, in pursuit of a few miserable whittings, not worth three-halfpence the whole lot; and I groped in the bottom of the boat, and pitched the three or four I found, overboard, exclaiming: "You are a nice lot to get into such a scrape for." "What's up?" said John, when he heard my exclamation. "I was only abusing these wretched fish we are likely to lose our lives for." "Well, I can't see much good that will do, though I hope the fish may not eat us quite so much," replied John. "One must find some vent for one's feelings," said I. "But what have you been thinking of?" "Well, to tell you the truth, I was just among the books at the office," replied John. "This answer, so different from what I had expected, set me off laughing. Notwithstanding our perilous position, I took a good long guffaw while I was about it. Not that I felt so very jolly either, you may be sure. "I hope your laugh has done you good," said John quietly, when I stopped at last; "but I really do not see what can afford you so much merriment." "Upon my word, I could not help it. To think of any man being so fond of business as to let it absorb his meditations in circumstances such as these." "If you were a family man, you would have understood. I was only thinking what there would be for Kitty, should I never be heard of again."

"Now, Kitty," pursued her brother, "I am going to make a confession: I behaved about——"

"Come, Charley, don't say anything about that," said John. "The fact is, we had a little quarrel, but we made it up. It was nothing at all."

"No, no, John! I am determined to make a clean breast; and it was not a quarrel, for I was the only one to blame."

"Ah, well," said John, laughing, "if you are going in for preambles like that, you had better out with it, or you will make everybody think it is something dreadful."

"Well, it is just this, Kitty. You must know that I never liked your husband. I could not really tell what for; but I used to look down on him as a shallow, conceited ass, and felt myself immeasurably his superior. So I allowed my dislike to get the better of me, and answered him like a brute, when he spoke of making a provision for you. I said: "That he need not trouble himself about not being able to leave a wealthy widow, for you were young and pretty enough to get another husband without it."

"O Charley! how could you?" cried his sister, looking reproachfully at him.

"Well, Kitty, I did not really mean it; I just said it to annoy him, for I was cold, and miserable, and reckless at the time. But I shall never forget his grave tone of rebuke as he answered: "God grant that she may find some one worthy of her to make her happy, should I never return; but it will be long before such a means of consolation occurs to her, poor girl." I made a senseless and sarcastic retort about conceit, when he stopped me by saying: "Come, Mr Methven, the next wave may finish our career in this world. Don't let it find us in such unseemly wrangling." And then, I don't know what he said, but he talked so that he made me feel ashamed of myself. In short——"

"In short," interrupted Mr Nisbet, "it is a case of much ado about nothing. But the sea became so much rougher, that we were obliged to stop pouring out our best feelings, and take to baling out the water, and try to prevent our boat from being swamped by a big wave striking her on the bows. It was getting lighter, and we soon descried a lighthouse, which we knew to be on the island of Cumbrae. You have heard how our boat was capsized, and the lighthouse keeper came to our assistance. His wife made us some nice hot tea, and dried our clothes, while we went to bed for an hour or two. We would have been here much sooner, if we could have persuaded the man that it was safe to leave the island. The sea is much rougher down there, exposed as it is to the Atlantic. If we could have telegraphed to let you know our whereabouts, we might have waited more patiently; but that was out of the question on a Sunday, even if we had not been on a rock with the stormy waves beating all round us. It was nearly mid-day before we could get across to Largs, and then there was some delay in getting a conveyance to Wemyss Bay. When there, however, we had no difficulty in hiring a boat with a couple of stout rowers to bring us over. And here we are, safe and sound."

"Well, you have had a narrow escape," said my brother. "Let us be thankful you are safe."

"We must drink the health of the returned wanderers," cried Tom. "Such an adventure is splendid when it is over. It is almost as good as a wedding."

"Yes, ladies and gentlemen," added my brother, "we will suppose it to be the wedding over again: bumpers for the re-united bride and bridegroom!"

The bride's happy tears were a fitting reply.

Several years have passed since that memorable summer. But the friendship then formed between us and the Nisbets has deepened and strengthened with each succeeding year. I am Aunt Mary to Mrs Nisbet's children—one of whom, the dearest little pet in the world, is named after me. Mrs

Nisbet shares her joys with me, and consults me in all her little troubles and perplexities; and we often talk over the troubles of that anxious day and night's Adventure on the Clyde.

Coca.

Coca, much talked about lately in connection with the doings of a wonderful pedestrian, is the leaf of the *Erythroxylon coca*, a climbing-plant, seldom attaining six feet in height, bearing small white flowers succeeded by red berries. The leaves, about an inch and a half long, are of a pale bright green and quite smooth, somewhat resembling those of the myrtle. When fit for gathering an operation performed three or four times a year—they fall off at the slightest touch of the hand; and after being dried in the sun, are collected in baskets large enough to hold half a hundredweight of leaves. The plant is little known in this country.

Although strange to European experience, coca has been in high favour with the Indians of South America for centuries, as an infallible preventive of hunger and weariness. Peter de Cieza tells us the Peruvian Indians of his time, esteeming the coca-tree of far higher account than the best wheat, nourished it carefully in the mountains of the Andes, from Guananga to the town of La Plata; and when they acquired a new piece of land, at once set about calculating how many baskets of coca it would yield. So great was the demand for it, particularly at the mines of Potosi, and so extensively was it cultivated, that in the years 1548, 1549, 1550, and 1551, the plantations gave an annual return to their proprietors of from forty thousand to eighty thousand 'pieces of eight.' This is not to be wondered at, considering that the Indians had such hearty faith in the virtues of coca, that, believing the more they ate of it the stronger they became, they were never seen without some leaves in their mouths, from the time they rose in the morning till the time they turned in for the night; while before setting out on a journey they took especial care to fill their leathern pouches with coca-leaves, and their calabashes with 'a whitish sort of earth' to be eaten with them. The simple leaf sufficed their necessities at home, unless bent upon a little extra exhilaration, in which case they took tobacco-leaves and coca-leaves in combination.

An English gentleman staying at Jamaica in 1789, received from a Mr Reader, who had just returned from a visit to Peru, a small horn spoon and a calabash containing about a pound of a white powder; accompanied with the information that the Indians, when travelling, took a spoonful of the powder whenever they felt hungry, and if thirsty as well, washed it down with a draught of water; and thus provided could compass a thousand miles afoot without requiring anything else in the way of refreshment. Upon examination the white powder proved to be nothing but lime from calcined oyster-shells; such as, many years later, Humboldt saw set out for sale in the public market at Popayan, for eating with dried coca-leaves, or for mixing with chewed leaves preparatory to being made up into pellets or pills.

Ulloa declares the Indians thought so much of coca or coca, that rather than go without it, they would part with anything or everything they possessed. 'They put,' he says, 'into their mouths a

few coca-leaves and a suitable portion of a kind of chalk called membi, and chewing them together, at first spit out the saliva which that manducation causes, but afterwards swallow it; and then move it from one side of the mouth to the other, till the substance is quite drained.' The herb, he avers, fortifies the stomach and preserves the teeth, and is so nutritive and invigorating, that the chewers of it could labour whole days without taking any other food. Another writer deposes that coca-eaters can work for eight or ten days without sleeping, untroubled by hunger, thirst, or fatigue. After this we are not surprised to learn that the Bolivian Indians, who take coca from infancy, are able to hold their own easily with mule-mounted travellers. Such among them as have won for themselves a reputation as 'good walkers' are employed to carry government despatches, being capable of accomplishing twenty leagues a day for several successive days with nothing to sustain their energies save coca and lipta—a preparation of cooked potatoes, pounded into a pulp and burned to ashes with a maize cob, which imparts a pleasant saline flavour to the otherwise insipid coca-leaf.

The Indian and half-caste women of the Upper Amazons are given to indulge overmuch in ypadin, made by baking coca-leaves in an oven, pounding them in a wooden mortar until half pulverised, and then mixing them with the ashes of the burnt leaves of the candelabrum-tree, in order to neutralise the evil effect of pure coca-powder. As coca-eating happens to be abhorrent to the ruling powers in Ege, the ypadin-loving dames are compelled to raise their coca-trees in retired forest nooks, to hide away their modest gatherings, and take their solace secretly. Mr Bates thinks that ypadin does no harm if taken in moderation; but if indulged in to excess, it destroys the appetite, and in time produces great nervous exhaustion. Humboldt, conceding that Indian messengers can travel for many days without any other aliment, pronounces against the use of the delectable mixture of leaves and lime, on the ground, that while exciting the secretion of the saliva and of the gastric juice, it takes away the appetite without affording any nutriment to the body; and an Edinburgh Reviewer, disgusted with a traveller's laudation of coca, does not scruple to assert that it is certain those who used it were remarkably short-lived. The Bolivian Indians, however, if we may accept the testimony of one who lived some years among them, are rather remarkable for their longevity; and if the coca-leaf is really very deleterious, it is hard to understand how it has retained its repute so many hundred years.

Supposing coca to be all its admirers assert, it does not follow that its introduction into countries yet blissfully ignorant of its virtues is at all desirable. Your coca-eater only works by fits and starts, ordinarily he ranks among the laziest of the lazy. Besides, what may be meat to the Indian in the healthiest tropical land in the world, may be poison to the energetic sons of colder climes; and the fact that in South America coca-eating is steadfastly eschewed by the ruling race, speaks strongly against the vaunted harmlessness of the practice. It is impossible it should be harmless; neither the body nor the mind can be defrauded of due sustenance and rest with impunity; though the payment of the penalty be deferred

for a time, it is sure to be exacted. Of stimulants we have enough and to spare. Those already used and abused may very well suffice those who cannot get along without something of the kind. Nobody that we know of wants to work day and night, or to dispense with meat and drink. Even if anybody does, it is possible that their end may be achieved by other means. From the Moluccas to the Yellow River, from the Ganges and the Indus to the shores of the Black Sea, the betel-leaf is, as old Gerarde says, 'not only unto the silly Indian meat, but also drink in their tedious travels, refreshing their weary spirits and helping their memory.' Abyssinian sentinels on night-duty keep drowsiness at a distance by chewing the leaves of the *Catha edulis*; Magnenus records that a soldier at the siege of Valencia, in 1636, underwent the greatest fatigue and lived without food for a week, thanks to a few quids of tobacco; and we ourselves knew a man who, when compelled to work through the night, kept himself awake and up to the mark by merely chewing tea. Tea being within everybody's reach, perhaps it would be as well if, before setting about importing coca-leaves, the medical gentlemen who have displayed such enthusiasm in behalf of coca, were to try the effect of tea and lime, and let the world know the result of the experiment.

It is surely a pity that three such important products as coca, the cocoa of the breakfast-table, and the cocoa-nut, though completely distinct both botanically and in their properties and uses, should have names so provokingly similar that most people, we believe, are puzzled to say which is which. The *Erythroxylon coca* of which we have been speaking has no connection with the cocoa-tree (*Theobroma cacao*), which yields the well-known beverage cocoa or chocolate. Equally distinct from both is the cocoa-nut palm (*Cocos nucifera*), the fruit of which supplies the inhabitants of many tropical coasts and islands with a great part of their food, and also furnishes the cocoa-nut oil of commerce. It is the more solid ingredient of this oil, known as cocoa-nut butter, that is so much used as an unguent when mixed with a little olive-oil to give it softness. Among the many changes of nomenclature constantly going on, could nothing be done to remedy the perplexity caused by so many diverse articles being known by names so closely resembling each other?

CONCERNING ROULETTE.

DURING the steeple-chase week at Aldershot some years ago, I was induced by a young friend, in whom I took a great interest, but over whom I unfortunately possessed but little control, to accompany him one evening to see some roulette played. I knew in a general sort of way what the game was, for I had often seen it on race-courses; but till that night I had no idea that it was carried on to such an extent in this country, or that men could lose fortunes at it.

My friend, whom I shall call Herbert B—, was an impetuous, warm-hearted Irishman, generous to a fault, and as fine a young fellow as you would see in a day's walk. He was, however, like many of his countrymen, thoughtless to a degree, and seemed always quite unable to resist the

impulse of the moment, whatever it might be. Knowing him to be in debt, and dependent almost altogether on his pay, I tried my best to dissuade him from going; but it was no use; and so I determined to go along with him, to try and keep him as much as possible out of harm. For all I could do, though, as it turned out, I might as well have remained away.

Every one, I suppose, knows what roulette is; but in case this should meet the eye of 'the exception,' I will endeavour briefly to describe it.

Four things are chiefly necessary for its performance. First, a board of peculiar and complicated construction, of which more hereafter; second, a cloth half-red and half-black, with sundry numbers and cabalistic characters painted on it; third, a professor of *legerdemain*, to manipulate the wheel; and finally, the flats to be pillaged.

Herbert B— represented the last item to perfection, except that he had very little to be pillaged of. In a few minutes all his available capital had melted in almost equal proportions on both the red and black, which colours he backed impartially, but generally with the same result, for he nearly always lost. His last coin having vanished, he rose to go, remarking incidentally that he had brought no more money with him.

'Won't you take a glass of champagne, sir?' said an oily voice at his elbow; and turning round, he beheld a sleek, close-shaved, Methodist parson-like individual, who was rubbing his hands in an apparently nervous manner, and smiling abjectly.

'Well, I suppose I may as well,' replied Herbert, as he followed the other to the sideboard.

'We'll be happy to lend you any money you like, Captling, to go on with,' insinuated the greasy owner of the oily voice, as the bottle was being opened; adding, as the liquor foamed into the tumbler: 'Your luck has been dreadful bad, to be sure; but it is safe to turn; and with the steady game you plays, you stands an uncommon good chance of winning, I can tell you, though I says it who shouldn't, if I consulted my own interest.'

But why dwell on my poor friend's folly. He gulped down the stuff they called champagne, borrowed ten pounds, and returned to the table.

When he left the house some hours later, he had written cheques for five hundred pounds in favour of the oily one, and to meet these cheques he told me he did not possess five hundred farthings.

I was unfortunately, poor myself, and could do nothing for him; so, advising him to go home and try and get some sleep, and come to me in the morning to have a talk about his affairs, we separated; he to his hut in the North Camp, and I to my quarters.

I never saw him alive again.

The following morning, when I awoke, I saw my servant standing by my bedside.

'You know Mr B—, sir,' said he. 'He shot himself dead last night.'

'Shot himself! Impossible! What on earth are you talking about?' I exclaimed, jumping out of bed.

'It's quite true, sir. His servant is here.'

Yes, it was true. My poor friend, in a moment

of desperation, which, as the jury truly said, was temporary insanity, had committed the rash act for which there is no remedy.

About a fortnight afterwards, I heard at mess the following story, which I will give in the words of the narrator:

'What about the roulette blaguard? Haven't you heard? Oh, I'll tell you with pleasure.

'You know Blan's billiard-room, I suppose? Well, the beggars had established themselves there, and carried on their little game on the billiard-table, from which they had removed the cushions. One night I strolled in by accident, and found the room crowded with fellows, some sitting on the table itself, and more standing round it, but nearly all dropping their coin like smoke. In the middle stood the roulette-board, flanked by heaps of gold and silver; and on each side of these were cloths, with the numbers and zeros painted on them in the usual manner. French of the 22d Lancers was being bled to a frightful extent. He would persist in backing the red for fivers; so, when I tell you the black passed four-and-twenty times, you may imagine it was rather hot for him. At Homburg, the longest run on record is thirteen or sixteen, I forget which; so this alone ought to have made the fellows smell a rat; but they didn't, apparently, for they went on playing as long as they had any money to lose.

'A few won, of course, and Smith of the — was one of them. The little beast was as pleased as Punch, and kept sticking half-crowns on whichever colour was not otherwise backed, till he had quite a heap beside him. He was right enough, perhaps, but it made me savage to see the only cad there winning.

'Well, matters went on like this for a goodish bit, and champagne was flowing all over the place, when in walks Robinson of the —th, who had just rejoined from sick-leave, surrounded by a lot of his pals.

'As soon as he saw the new arrival, the fellow who was twirling the board gave a little start, and became visibly paler. He, however, kept on as usual, called the game steadily—twenty, red, even and over—raked up the winnings, and paid away a few half-crowns, and was just proceeding to give the wheel another turn, when Robinson, who had strolled quietly round to his side of the table, coolly shoved him on one side, and drawing the board over to himself, called out in a loud voice: "Gentlemen, allow me to explain the mechanism of this swindle."

'There was, of course, a tremendous row immediately. The rest of the gang closed up from their outlying posts about the room, and before you could say knife, the whole of the money had disappeared. Two or three of the swindlers then tried to get hold of the board, and the mean beggars who had been collaring their half-crowns backed them up, and were loud in their cries of shame and order; but Robinson stuck to the timber like a good un, and being supported by his friends, soon carried his point, and obtained a hearing.

'In two minutes the whole dodge was explained and practically illustrated, so that even the half-crown fellows were obliged to admit they were convinced.

'This is how it was done. You know the little

partitions which divide the holes the ball settles in, from each other? Well, these were all movable; and Robinson shewed us how, in the act of setting the wheel going, while he whirled the ball in the opposite direction, the fellow who operated could raise with his little finger whichever partition he liked, to the extent of about the sixteenth of an inch above the rest. If he wanted black to win, all he had to do was to elevate the partition in front of one of the red holes; and as the ball kept on rolling round and round, it would naturally and necessarily stop eventually where it met most resistance, and thus remain in whichever colour or number the scoundrel had, as it were, set it for. To do this so as to avoid detection required, of course, considerable sleight of hand; and it was on this account, no doubt, as Robinson pointed out, that, though the gang numbered some seven or eight in all, it was invariably the same individual who presided.

'This explanation occupied some considerable time, and caused, as you may imagine, no end of sensation, particularly among those fellows who had been losing heavily. Immediately there arose a cry for vengeance, and the only one of the lot who could be found was forthwith seized by a dozen irate warriors, who with one voice demanded satisfaction. The poor wretch, a low-sized greasy man, tried in vain to make himself heard, and shrieked aloud for mercy. None, however, was shewn him; for first his hat was playfully kicked about, and then his coat was torn off piecemeal, revealing remarkably dirty under-garments. His waistcoat disappeared next, and finally his trousers and boots vanished. His costume then consisted of a dilapidated flannel shirt and filthy socks; and it was lucky for him that these articles were in such an uncleanly state, for it was that fact alone which saved him from being turned adrift on the streets of Aldershot as naked as he was born.

'It wasn't a bad lark, was it? But I forgot to say, that in the fellow's breast-pocket there was a wallet of ponderous dimensions, and in it a number of cheques and bills, which a man, whose name I won't mention, but whom you all know, made a small bonfire of, on a tray in the centre of the billiard-table.'

'Well, I must say,' said our Colonel, who had been an attentive listener, 'that I am surprised you should have gone to such a place under any circumstances; but to go so soon after that terrible affair in the North Camp?—

'I beg your pardon, sir,' interrupted the narrator of the story; 'but all this happened the night after poor B——'s death, the particulars of which had not then oozed out. Had the circumstances which led to his sad end been known, it would have fared much harder with the greasy man. But it is satisfactory to know, isn't it, that he did get some punishment?'

Herbert B——'s cheques were probably among those that were burned, for they were never presented. Poor fellow! I tried hard, that fatal night, to get him to stay at my quarters; but he insisted on going home. If I had only known what was about to happen! But who can tell what a day—or a night—may bring forth!

NATURAL MAGIC.

IN fingering that very small object, a shirt-stud, it is apt to elude the grasp and disappear. It has gone no one knows whither. You look about for it in all directions, but it is not to be seen. This is what we call Natural Magic. You have unconsciously performed a singularly clever trick, as good as any sleight-of-hand. It was, however, only an accident, and could not, without great study and experience, be done again. Of course, the little object has not vanished into empty space. It is lying quietly in a remote corner of the room, possibly concealed by the folds of a window-curtain, to which, in the twinkling of an eye, it was sent by a twist of the fingers; and there perhaps it is found some days afterwards by the housemaid. We mention this familiar incident by way of illustrating some of the ordinary tricks of conjurers. By light flexibility of fingers, and immense tact in distracting observation by amusing talk, they make things disappear in a manner so extraordinary and mysterious as to baffle comprehension. They only do by artifice what you accidentally effected with the shirt-stud. All depends on skill and velocity in giving the right twist to the fingers.

That is but one explanation of the profound art of the conjurers. They rely on the sentiment of wonder, and power of bamboozling the simpler order of mortals. Acute in observation, they occasionally excite surprise by correctness in guessing what are one's thoughts. We may give an example, which has come to our knowledge. Towards the end of last century, a conjurer, named Herman Boaz, travelled about the country, astonishing every one with his tricks. His shrewdness in guessing thoughts was remarkable. At one of his performances, at a town in the south of England, where a number of young ladies were present, he went round the room offering to tell people's thoughts. One young lady, who had formed a notion of rising next morning at five o'clock, changed her intention, and made up her mind to rise at seven. Passing her, and looking her in the

face, Boaz said complacently: 'You are quite right, miss; seven is a much better hour than five.' The young lady addressed never forgot this astonishing piece of conjuring. It was simply a happy coincidence in falling on the right idea. If the guess had been wrong, we should never have heard of it.

The art of the conjurer is of very old date. We hear of it in many ancient writings; the general belief always being that the tricks were performed through supernatural agency. Several clever conjurers ventured on appearing before public assemblies in England in the course of the sixteenth and seventeenth centuries, which was rather a bold thing to do, for the laws against witchcraft were still in force, and the poor conjurers, in trying to pick up a livelihood by their professional deceptions, ran the risk of perishing on the gallows or in the blaze of a tar-barrel. The fairs about London were usually frequented by these experts, some of whom are commemorated by Mr Frost in his very amusing volume, lately published, *The Lives of the Conjurers*. Flourishing as a contemporary of Boaz in the reign of George III., there was a juggler named Ray, who gained popularity in London. He appears to have employed a variety of jargon to give a sort of supernatural colour to his deceptions. 'He had once,' says Mr Frost, 'the honour of performing before the royal family, of which, on one occasion, an amusing anecdote is related. Ray desired the queen to say *Cockalorum* as the charm upon which, as he pretended, the success of the grand deception depended. The queen hesitated; upon which the king, who was eager to witness the conjurer's great trick, turned to her, and said good-humouredly: "Say *Cockalorum*, Charlotte; say *Cockalorum*."

About the same period, Breslaw gave conjuring entertainments in London, and, like Ray, had the honour of performing before the king and queen and their young family. Breslaw had the candour to explain how he performed his tricks. In one of his advertisements, he announces that he will 'discover the following deceptions in such a manner
